Q. Now, taking the first building at 42nd Street, the valve house and vault, Mr. Mayer, computing in detail, made the cost per cubic foot 31.9 cents for the building, and you make it fifteen cents, or only half as much. Will you state again exactly how you make up that fifteen cents?

A. The very best building in the plant of the Consolidated Gas Company appears to me to be the governor and boiler house of the 132nd Street station. That being the case, and the figures being known to the Consolidated people, as well as to Mr. Mayer, it was proper to assume that the actual cost of that building was somewhere near right, and the cubical contents of an analogous building which was not much too small would be somewhere near right. The 5278 actual cost of that building is given by Mr. Mayer of the Consolidated Gas Company at 26,736, which, divided by the cubical contents, from Mr. Mayer's measurements, gives an average of 13.2 cents per cubic feet of contents. That, then, gave me what might be called the best standard, the highest standard of quality that was in existence in the Consolidated Gas Company, and the computations which I made will show you that the very simplest, plainest buildings were far below that, though in using fifteen cents per cubic foot I felt moderately safe in feeling that I was more than liberal in my dealings with the buildings.

Q. But you say you took ten cents in the case of the 42nd Street building, to which I called attention, and added thereto five cents additional for the foundations of apparatus?

A. Yes, sir; that is where piles came in.

Q. Were there any foundations of apparatus of similar kind and character involved in your 132d Street building?

A. Calling your attention to that, to the five cents additional for pile buildings, included buildings of very great size, of the retort house, and condenser house size, and on the smaller valve house size, and the finish in the case of retort houses, of condenser houses does not exist, while the finish in this new valve and engine house at 132nd Street was exceedingly nice and attractive.

Q. What did you call the finish?

A. The hall, the wainscoting, the tiled brick, the staircases, the cemented floors, the general appearance of this building at 132nd Street.

Q. Now, fifteen cents seems to be the highest rate per thousand cubic feet, reckoned on the cubic capacity, that you have allowed for any building. Isn't it?

A. I think it is.

Q. In any one of the plants?

A. Yes.

Q. Now, don't you know that a great part of the cost of
5279 building an oven—the most difficult and most troublesome
part, results from the laying of the foundations; that is,
whether it may be rock or may be soft foundation where you have to use piling, or go down a great depth?

A. Certainly. I think that was the reason of my addition.

Q. And are you aware that this 132d Street building, which cost between thirteen cents and fourteen cents, had a foundation comparatively shallow in coarse sand, with no rock on one hand and no piling on the other hand required?

A. Of course I had only the scant examination that was allowed me. It looked like an ordinary foundation, but it was very well finished as compared with the other buildings.

Q. But the finish of a building would bear comparatively small relation to the additional cost of foundations if you had to drive seventy or eighty foot piles or excavate a good deal of rock, wouldn't it?

A. Oh, dear, no. The style of finish you see here in New York in some of these buildings would run the cost of these big buildings up to thirty, thirty-five, forty, forty-five or fifty cents a cubic foot.

Q. I understand that is so in office buildings and that sort of thing, but I am referring now to the ordinary gas buildings, such as this 132d Street building. There is no mahogany finish there?

A. Oh, no, but it is a long way the best of the lot.

Q. But if you had pile foundation, or a foundation where excavation of rock was necessary, a similar building would cost very much more than thirteen cents, wouldn't it, if you had to go to the additional expense for this expensive foundation, and assuming also that the 132d Street building had no rock nor piles to deal with, but was a shallow foundation on good soil?

A. Well, with a rock foundation, and a building of that
5280 sort you have a very decided gain in economy, because the
rock you blast can be used in building the building and probably would be used both for foundations and building the building, and for that foundation is where the cost runs in.

Q. What did you figure for a similar building at 111th Street station—I mean similar to the 132d Street building, of course—exhaust and engine building at 111th Street? Exhauster house, it is "Item No. 2, buildings, 111th Street"?

A. Item No. 2 Exhauster house and basement, six-inch concrete floor, $18,532.82.

Q. Per cubic foot you allowed?

A. Fifteen cents per cubic foot.

Q. In other words——

A. In other words, I put it on a par with the 132d Street station.

Q. Now, do you not know that at the 111th Street station it was necessary to go down with a broad foundation, something like eighteen feet on one side and produce a much more expensive building on the whole, therefor-, than the 132d Street building?

A. I did not know that, but I was liberal because its finish is not equal to the 132d Street building.

Q. Do you think the difference in the finish could offset going down eighteen feet with a foundation, as against a shallow foundation or an ordinary foundation for the 132d Street property?

A. I could not answer that definitely without a careful study of the plant and quantities.

Q. Those would all be details which it would be necessary to take into consideration and compute upon if you wanted to reach your exact result?

A. Yes.

Q. And I see in each of these cases, that in each one of the plants you reach the value of the buildings by assuming a certain cost per cubic foot, either fifteen cents or ten cents or five cents and multiplying the cubical contents by that. That is the way you reach
5281 your value of the building?

A. Yes.

Q. You do not reach the value of a building by some other process and then divide it by the cubical contents in order to find how much it would be per cubic foot in your computation?

A. I did not, no. I took the outside valuations per cubic foot, to be on the safe side.

Q. How much did you consider that the wages of carpenters are per day in New York City?

A. I don't know.

Q. How much for slaters?

A. I know the cost of slate per square foot.

Q. Slater?

A. I say I know the cost of slating per square foot but not the price of the slaters.

Q. Nor slater's labor?

A. No.

Q. Plumber?

A. No.

Q. Plumber's helper?

A. No.

Q. Painters?

A. I did, but I have forgotten. Mighty little paint around gas works.

Q. Do you know what masons get?

A. About the same as bricklayers.

Q. Well, that would be about how much you think?

A. Somewhere between four dollars and five dollars, according to the locality.

Q. Don't you know that you have to pay nearer six dollars per day to a mason in New York City, or was not that brought to your attention?

A. I have inquired within a very short time and was told that masons and bricklayers kept even.

Q. And haven't you learned that we have to pay laborers about three dollars a day in this kind of work instead of $1.75?

A. Not around gas works.

Q. Is it your idea that the Union permits a man to work in laying stone work at a gas works in New York City at any lower price than laying stonework anywhere else, of the same character?

A. I think you have confused laborers with hodcarriers 5282 and mortar mixers. In some cases the demand is as high as $3.50.

Q. But you have no idea, have you, and you do not mean to suggest, that the Union permits its men to work cheaper per day on the gas company's work than on work for anyone else?

A. The gas work is comparatively rough compared with the many very carefully built buildings——

Q. But the rate of wages per day is the same, according to your information, wherever a Union man works in New York City, for the same character of work?

A. On the same character of work, yes.

Mr. Burr: I think the Doctor might state what he has in mind when he says laborer.

Mr. Mathewson: Very good.

By Mr. Burr:

Q. Whom have you in mind when you speak of laborers?

A. I thought Mr. Mathewson had confused laborers, who are men without any skill of any sort or kind, who are lifters and carriers, with mortar mixers and hodcarriers, who are in a limited way skilled men in their own line and they demand good pay and get it.

By Mr. Mathewson:

Q. But you do know that a mason—and when I say a mason I mean Union masons in New York, as they are the only kind that we know anything about—and stone layers receive the same wage per day, wherever they are at work laying stone?

A. I am under the impression that those who do labor work, just the roughest kind of work, do not get as well paid as those who do the finest kind of masonry that is done in our buildings here. 5283 I refer to our stone-faced buildings, a very high class of work required in our larger and finer buildings.

Q. Now, what I have asked you in reference to these buildings at 42d Street and your method of computing values and the theories upon which you have proceeded in computing these values of different buildings and structures which you have included in your estimate, cost of buildings, applies to all the stations, doesn't it?

A. It does.

Q. Referring to the 42d Street buildings as a whole, I see your total for buildings, original cost, or actual cost without depreciation is $434,250, if my figuring is correct, against six hundred thousand dollars or such a matter, or more than that sum, for Mr. Mayer—at least, yours is very much lower than his, isn't it?

A. $434,250.34 is the sum total of the structural cost of the buildings, solid walls and uncomputed structures.

Q. Now, I see that in your apparatus at 42d Street and also in computing the value of apparatus at other stations you have put in the value of the different apparatus at round figures like three thousand dollars, valve house, purifier house (p. 5067) $24,000 for purifiers, $12,000. I suppose those round sums are inserted, because it was impossible within the time at your disposal to make more definite estimates, wasn't it?

A. Why, it would be a mere pretense on my part to pretend to the accuracy of a refined estimate in the brief time permitted.

Q. Did you make inquiries from the makers of the various apparatus, that is, engines and so forth, as to what they would sell engines and install them for?

A. I did not, but I have been buying engines for thirty-five years, and there has been rarely a year in which I have not had more or less to do with the purchase of and the sale also of engines, and I have a pretty fair idea of what the stuff was worth when I looked at it.

5284 Q. And your figures were for the delivery of the apparatus at the companies?

A. Yes.

Q. And any difference between your figures and the original cost of Mr. Mayer would be made up perhaps by the expense of setting by the company after delivery, or something of that sort?

A. Something of that sort; but I think in most cases of apparatus my figures were somewhat higher than Mr. Mayer's. I think you will find that with the exception of the gas holders that the general machinery and casting work is exceeded in almost every case.

Q. And, of course, you did not take the trouble in these various items of apparatus to compute the weight, except so far as it may have been stated by Mr. Mayer or appeared from the dimensions?

A. In three or four cases I had more than three or four, I had one of my assistants do some figuring on Mr. Mayer's weight and in every case corroborated them and I dropped them.

By Mr. Burr:

Q. That is, you accepted his figures?

A. I dropped the computation. I did not go any further after that.

By Mr. Mathewson:

Q. And you found, too, I judge, that his cost in cents per pound for this apparatus which he used, taken in conjunction with the weight to be the original cost, was proper as far as you could judge?

A. Assuming thin castings, as thin as they could well be made, Mr. Mayer's figures appeared to me to be about right, and I was willing to assume those right straight along. Assuming Rowland's castings or those of the same kind that he used to make there is a pretty big profit in some of them.

5285 Q. Now, when you referred in the 42d Street plant (p. 5064) in your notes on the retort house to certain retorts being fired and certain idle, just what do you mean—that these were not in operation at the time you looked at the plant?

A. That's it, yes.

Q. On what day was this at 42nd Street.

A. Somewhere between the 17th and 31st of December.

Q. It was the date which you have given in your prior testimony as the date of your investigation there?

A. Yes.

Q. Now, you assume at 42nd Street, that forty-three years' depreciation has gone on, upon the theory which you have mentioned, at .85 of one per cent. per annum, a total of 36.5 per cent. for the value, and in getting this forty-three years I assume you subtract 1863, which you gave as the date of the buildings, from the present year, because that leaves just forty-three years?

A. Yes.

Q. Now, as a matter of fact, you don't know how much has been spent in replacement or repair or renewal on those buildings during the period from 1863 down to date, do you?

A. I looked at that apparatus just as sharply as I could, and it was the main thing I feel strong on.

Q. But this is buildings which you art taking this off from——

A. I mean apparatus and buildings—I looked at it all, just as sharply as I could in the limited time I had, and it was pretty much alike; there wasn't much difference in it.

Q. Well, you understand, Professor, that it is in evidence that since 1884 alone there has been expended in renewals, offsetting some amount of depreciation marked off, amounting to $1,227,683.10, and there has been expended for repairs to buildings, amounting to $1,275,749.03, and to apparatus $4,865,362.51, or a total of between $7,000,000 and $8,000,000 since 1884, according to Exhibit 79?

5286 A. That .85 of one per cent. assumes the keeping in perfect repair of both buildings and of the apparatus and the expenditures of all sums necessary for that purpose.

Q. And the same is true as to the other plants where you have pursued the same course and theory?

A. Yes.

Q. Have you any knowledge as to when those buildings all were constructed upon which you base your 1863 estimate?

A. No, sir, except the statistics found in the testimony of Mr.

Mayer, and in many cases a general judgment, or from looking at the buildings sharply to fix if I could in my mind any difference, any discrepancy that might appear in the buildings, as if one had not some different age from another, to see if one was of different age than another.

Q. Now, referring to the 21st Street plant (record, p. 5076), your estimate of the average date on those structures, 1874, was based upon the same considerations as on 42nd Street, wasn't it? That is to say, what you got from Mr. Mayer's testimony plus your own generalizations?

A. In the case of the 21st Street station, reference (referring now to the buildings) to Rowland's inventory called my attention to the fact that many of the buildings used for stove storage, meter repair shop, stove repair shop, stove cleaning room, prepayment meter washroom, and so on, had their foundations, or were in part built anterior to 1884, and that Mr. Mayer's figures of 1890, the date when they were built, probably were not wholly correct, although he was probably informed on that point. I was not informed, because of the fact that everybody who was assigned to act as guide was instructed also to be absolutely a deaf mute.

Q. Well, I do not think that is quite right. I will merely say that, naturally, the officers of the company could not escort you around, and, moreover, there isn't an officer of the company now who probably knows of his own knowledge when each one of those buildings was built, and so that anything your guide might have said would have been simply a speculation, and we were not willing they should speculate. 5287 & 5288

A. The result was that they would——

Q. They did not know and could not tell?

A. One of them didn't know when he entered the works even.

Mr. Mathewson: Well, we knew when you entered them, because he informed me.

It is now four P. M. Mr. Burr is desirous of getting away, and I think, therefore, that we might adjourn until the morning.

At 4:00 P. M. adjourned to January 8th, 1907, at 10:30 A. M.

Last Exhibits:

Complainant's, 270.
State's, OOO.
City's, 135.

5289 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucian L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

January 8th, 1907.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby, Mr. Page.

5290 Continuation of the cross-examination of William D. Marks.

By Mr. Mathewson:

Q. Referring to page 5067 of the record, apparatus of the 42d Street plant, I observe an item numbered 45, reading "added for Dep." That means what?

A. When Mr. Mayer made his inventory he, in several instances, took off 25 or more per cent.; afterwards in his revision he recanted and took off only 5 per cent. This is an error due to the stenographer running down over Mr. Mayer's list and putting in "added for Dep.," and omitting to put anything opposite it, because I had crossed it off.

Q. That represents a case where Mr. Mayer had testified that after a further and more careful inspection, and learning that apparatus had been renewed, or was more recent than he had supposed, he put on a lower figure for depreciation?

A. I presume something of that sort.

Q. And wherever we find a similar memorandum in your testimony, it means the same thing?

A. It means the same thing, only it should have been crossed out. I am responsible entirely for the final recapitulations. There are a number——

Q. It does not mean anything so far as the totals go?

A. It does not mean anything.

Q. I find Item 50, you have one cast box 7 feet 6 inches by 5 feet 6 inches by 9 feet, marked out of use?

A. Marked out of use, yes.

Q. And you give no value to that?

A. And left out.

Q. You omit that from your valuation?

A. Yes.

Q. I see Item 76, page 5068, one bench lathe with no amount following it.

A. I have a very vivid record of that bench lathe. I saw it 5291 in operation and it was the oldest thing I have seen in many a long year.

Q. You left it out then and gave no value to it?

A. Yes, no value to it.

Q. And wherever we find in this testimony items opposite which there appears to be no amount, either under this or the other stations, to put a general question, you have omitted those from the totals which you have given, of course, or they do not go to make up the totals?

A. I have. May I make a correction right here? On page 5096, Item 5, all walls around property, $42,760.17 should be changed to $34,000, as given in the second item on page 5095.

Q. That $42,760.17 ought to be what?

A. Changed to $34,000.

Q. Exactly $34,000?

A. In round figures.

Q. Well, would not that change your total?

A. That would change the total. That is due to the failure of the stenographer to correct as directed after my revision, omitting at that point.

Q. The total would be what, instead of $52,446.97?

A. It would be the difference between those. I will work that out if you like. That would change on page 5096 the totals of $52,446.97 to $43,740.80.

The Master: Does that effect your grand total, or is the $34,000 in the grand total?

A. Not at all. It was simply a neglect of the stenographer to go back and correct it in the itemized details.

Q. Referring to the 21st Street plant, page 5076 of the testimony. where you say Mayer's valuation of sheds as compared with Rowland's valuation, I assume that you took simply the description from Rowland's inventory; you had no further information as to what he appraised in that inventory, had you? I mean, of course, that attached to Senate Document 47 of 1886, which has been of- 5292 fered in evidence here.

The Master: Can you not answer that question from memory without taking time to look it up?

The Witness: Yes.

The Master: He wants to know whether you had any other sources of information besides that schedule.

The Witness: None.

Q. When you speak of the number of retorts at 21st Street fired and idle, do you refer to a count which you made at the time you visited the plant?

A. I do.

Q. And when you say that the apparatus or most of the apparatus except the $520,250 worth from which you take no depreciation appeared old and dirty, you could not tell how old the apparatus was by its simple exterior appearance except by information as to when it was purchased?

A. Except in machinery which in some cases showed a considerable amount of wear.

Q. And as to the apparatus being dirty, it was in operation, was it not mostly?

A. Yes. It did not look to me—take particularly the tar tank and a good deal of the tar filter process, as if it had been recently used; in fact, you take some of the machinery there, the tar filtering machinery did not look as if it had been used for years.

Q. Don't you know that the 21st Street station has shown a large increase in output and has been operating to its full capacity? You remember the testimony to that effect?

A. I remember the testimony to that effect, and I also
5293 stated that the water gas apparatus appeared to be in operating condition throughout.

Q. And you know that some oil gas is made there which is sent down to 14th Street and mixed with the coal gas?

A. Yes.

Q. The fact that machinery may not be physically clean in a gas works does not necessarily mean of course that it is rotting away or physically deterioriated, does it?

A. No, not in all cases anyhow.

By Mr. Burr:

Q. What do you mean by saying old and dirty here?

A. I meant that it was old, a good deal of it, and all of it dirty; it was the prominent characteristic of everything around the 21st Street station.

Q. Did you mean by dirty that it detracted from its value as a working plant?

A. I do, it always does. It increases wear and tear.

By Mr. Mathewson:

Q. Well, a gas plant in operation is not a place, anyway, to go to in order to keep pure white linen clean, is it?

A. No, but the 99th Street station was exactly the reverse of that.

Q. Well, that makes a good average. Referring now to the 99th Street station, page 5084 of the testimony, you have a note, eleven benches double length retorts, not used. Do you mean that they were not in use when you called on the occasion you stated?

A. Yes.

Q. And where such notes appear as to any station, it refers to the fact that they were not in use at the time you called, as you had testified?

A. That is so.

Q. What about the six vacant arches in the stack—I suppose it means stack instead of stock?

A. Yes. They were vacant. For what reason, of course,
5294 I could not learn, under the instructions of my guide, at the various works.

Q. Well, you did not hear any instructions given to your guide, did you?

A. No, but I saw the result.

By Mr. Burr:

Q. You did not select the guide, Doctor, did you?

A. No.

By Mr. Mathewson:

Q. Referring to the 63d Street apparatus, page 5093, you state that the buildings are a lot of tumble-down sheds. Nothing but sheds there?

A. There may have been a brick wall supporting the roofs of some of those tumble down sheds, or tumble down roofs of the tumble-down sheds; everything was in an inchoate condition there, evidently of the most temporary character and fixed up.

Q. And you found that not a very large value was placed on it, did you not?

A. Yes.

Q. As to the depreciation of the holder estimated from appearance, what was the appearance of the holder?

A. About ten per cent. off from new.

Q. Yes, I know, but you say it was depreciated in appearance. What about the appearance of the holder?

A. Well, it had that amount of apparent wear and tear about it, as near as I could judge from the looks of the thing.

Q. It was in opertion, was it not?

A. Yes.

Q. Take next the 55th Street station, page 5905. That station you have corrected now so that the totals or figures on page 5095 conform with those on page 5096?

A. I have, yes.

Q. Going back for a moment to the 21st Street station, was it, you spoke of one of the sheds there being dilapidated?

A. Roof gone.

5295 Q. Roof gone, etc. What shed was that?

A. If I remember rightly, Shed Number 6.

Q. Now, referring to the 111th Street inventory at page 5098, I am unable to find on the following two pages the totals which you incorporate at page 5098 in the summary. I wish you would point them out to me?

A. $20,921.53, items 2 and 3.

Q. That is buildings without depreciation, $20,921.53?

A. Those are items 2 and 3 added together.

Q. That is to say on page 5099?

A. On page 5099.

Q. What about item 4, hoisting engine house?

A. Hoisting engine house $81.90, is out at the end of the wharf and is a wooden building containing an engine——

Q. I know, but that is all right. I think that appears perhaps, but why have not you added that into your total of buildings and also the scale house $351 and the stable, $8,400, on page 5099, which would make a total of something like $30,000 for buildings instead of $20,291.53?

A. The buildings depreciated on page 5098 are all old buildings. The stable is a very old stable, and the hoisting engine house is a very old wooden shanty.

Q. The $20,921.53 on page 5098 is the sum of items 2 and 3 on page 5099?

A. Yes.

Q. Give me the buildings which make up the $64,290.70 on page 5098 which you put under "Buildings Depreciated."

The Master: It is all the rest, is it not, Mr. Mathewson?

The Witness: It is intended to be all the rest except the walls and fences.

Q. Where do the walls come in? I see you have put over
5296 on page 5098 walls and fences depreciated $4,010, and you
have on page 5099 walls, values, etc., not computed in cubic
feet $4,010. That is the same item, is it not?

A. Yes.

Q. Where does the $197.12 come in, as part of the $64,290.70? I refer to the walls, $197.12?

A. You refer to item 16?

Q. Well, it follows, between 16 and 17. Yes, it appears also to be item 16 as well. It looks as though——

The Master: It does not balance within $10 either, those two sets of figures.

The Witness: This inventory on page 5098, 111th Street, is the correct revised—overhauled work; these detailed inventories on page 5099 were left to the stenographer to be straightened out as marked by me and evidently were not in some cases, as we have already found out.

Q. But it is intended in each case that the summary or recapitulation of inventory for each plant shall actually coincide with the details shown later in reference to that plant?

A. Yes and should coincide.

Q. And if it does not in this case it is simply an error?

A. It is simply a stenographic oversight, that is all; these were made up from my figures.

Q. Well, I think the rest of it I understand there. Let us look at the Inwood station, page 5103. In the recapitulation the first item of $1,373 corresponds within twenty cents with the $1,372.80 in the detail below?

A. Yes.

Q. That is the same item, is it not?

A. The same item.

Q. In reference to apparatus——

A. Four and five.

Q. The next item in the summary is total gas machinery $2,300?

A. Yes.

Q. Where is that below?

A. 2, 3, 4 and 5.

5297 Q. Items 2, 3, 4 and 5, $2,300?

A. $2,300.

Q. You exclude then wholly the holder?

A. As of no value.

Q. As of no value, which cost new $12,000?

A. Yes. That is due to the fact that it has been left there idle, boarded in——

Q. Is not there gas in it?

A. There may or may not be gas in it. You cannot tell. It is down and fastened down practically; the counterweights are taken off of it and are lying on the ground and dismantled.

Q. At any rate you have excluded it entirely?

A. Yes.

Q. The rest is clear I think. What do you mean by the holder being fastened down?

A. The counterweights are taken off of it; it is a very elaborately gotten up and very small holder, having double counterweights for the lower lift and single counterweights for the upper lift and quite elaborately braced columns for the purpose. It is evident that the engineer who designed it meant to make it throw a very light pressure or else that it was originally a very heavy holder, and taking these counterweights off simply set the thing down, you may say, solid. Then around the edge of the tank between the tank and the holder are cut and jammed in at a slant a lot of boards to prevent toads and things from hopping into the tank. It is jammed there.

Q. Well, now, Doctor, let us take page 5108 and page 5109, in which you have made a summary of values, and do a litle figuring on it. You make the total of those figures $31,122,454?

A. Yes.

Q. You take the original cost of land to the six merged companies, that refers to the books of the six companies as you understand?

A. As explained by Marwick, Mitchell & Company.

Q. And the second item is clear, balance of cost of land

5298 transactions. And then we come to abandoned land?

A. Yes.

Q. How do you get the valuation of $317,100 for bulkheads and $875,916.37 for land at 18th Street taken by the City?

A. You will note on page 5108 that I speak of this as a final estimate.

Q. Yes?

A. These are the estimates given to me from the Corporation Counsel's office of the valuation placed upon this land by experts for the City in the litigation at present, I believe, going on between the City and the Consolidated Gas Company.

Q. Well, the point is, those are the estimates of the City or figures given you by the City's counsel?

A. By the Corporation Counsel.

Q. You are not a real estate man yourself and have not made an appraisal?

A. I am not a real estate expert.

Mr. BURR: And the company may recover more than is given here, that is conceded.

Mr. MATHEWSON: Lots of things may happen.

Q. That leaves a net for land of $2,925,251 at that point?

A. Yes.

Q. Now, you add to that your value, after taking out your depreciation, for the plants of the company, including buildings, holdings, yard connections and apparatus, amounting to $9,348,692?

A. Yes.

Q. That is your testimony. Now, when we come to the street mains, you remember that the $7,142,232 was the value of the mains as you computed them upon the mileage which you had deduced from your measurement of the maps?

A. Yes, that is of active mains.

Q. Active mains?

A. Active mains.

5299 Q. And you remember that the 822 miles of mains which Mr. Simpson testified were active or not abandoned, upon your estimate of value would have been something over $8,000,000 for original installation, a little over $8,000,000?

A. I think it was very close to $8,000,000.

Q. Yes, it was very close, but a trifle over?

A. Yes.

Q. Now, why do you deduct something, that is $1,017,220, from the value which you found for our active mains in obtaining the $6,124,012 of mains which you proceeded to credit us with?

A. Superintendent of Mains Simpson testified that at no time within the last sixteen or seventeen years had anything less than six-inch mains replaced the existing mains, meaning by that inferentially that five-inch mains and below that were obsolete——

Q. Well, but he testified, you remember, that in replacing mains now he would replace, if he had to do so, with larger sizes?

A. Yes.

Q. But he also testified that we had in use still a great number of these small mains and it so appeared. Now, do you think it is fair, when we are actually using those and they are concededly active mains, to deduct $1,017,220 from your previous own valuation of active mains?

A. The doubt in my mind, placing myself in the attitude of a prospective purchaser, an attitude which I believe was what Judge Lacombe desired in any estimate, was whether or no it would be proper to throw out altogether the 2, 3, 4 and 5-inch mains which are actually in use——

Q. In spite of the fact that we are actually using them?

A. They are actually used.

Q. Yes?

A. Or to throw out the difference between the six-inch mains which Mr. Simpson testified was the least size that you put in, and I decided in fairness to the company, instead of throwing out the two, three, four and five-inch mains, that I would throw out only the difference between six-inch mains of the same length and these smaller sized mains. The—— 5300

Q. But as a matter of fact you say that the cost of the two, three, four and five-inch mains would be only $624,435, and you have therefore thrown out in the neighborhood of twice as much as those mains were worth, because those mains would be worth according to your estimate very much less than the difference between those and the six-inch mains of the same mileage?

A. Because in replacing six-inch mains you would have to dig into asphalt pavements, and undoubtedly anybody who purchased these works for the purpose of operating them would end up by doing that in the course of time.

Q. I understand, Doctor, but the effect of this is not only to throw out the value of our six-inch mains, which was $624,435, but actually to throw out $1,017,220 from our active main value as you have computed it, is it not?

A. It is facing the facts as they are.

Q. Well, at any rate we have got at the theory and we will proceed a little further. After you get the structural value of plants, as you call it, by your figuring amounting to $23,460,020 you take the estimate of Thompson and McHale, an average, and add to your land value enough to bring the $2,925,251 which you originally allowed up to the average of Thompson and McHale?

A. Yes.

Q. That is $7,762,434?

A. Yes.

Q. Which makes your total of $31,122,454?

A. Yes, sir.

Q. Now, we have not any working capital here, and you will recall that you took several Massachusetts companies which you said were the nearest you could get in situation to the Consolidated and at page 3777 you said, that on the same basis of working and active capital which they were employing, the Consolidated would
5301 require $6,375,918.52. Will you be good enough to take these figures? If you wish to refer to that page to verify the amount I will present it, but perhaps you remember it?

A. I recall the total working capital.

Q. Now, will you be good enough to add that to the $31,122,454 and say what total that would give?

A. $37,498,372.52.

Q. But this does not include plant enough to produce all the gas which the Consolidated Gas Company sells, and you stated in your direct-testimony that in addition to the Consolidated Company's property in Manhattan, we would have to allow on the basis of two dollars per thousand for additional capacity plant of the value of $5,097,389.56, at page 2353 of your testimony. Now, will you kindly add that to the last previous amount?

A. $42,595,762.08.

Q. Now, if, as a matter of fact, we consider this plant which will produce the three billion or four billion feet which the company sells, but does not make, as located at Astoria, and we find that it costs more than four dollars, according to the testimony, per thousand feet instead of two dollars, and if we take, therefore, the actual cost of the Astoria plant, that would mean an addition of about five million dollars more? In other words, if four dollars was correct instead of your two dollars, wouldn't it, for additional plant, be just about $5,097,389.56 more as you remember you computed that on the basis of two dollars?

A. Taking your figures, as a matter of computation.

Q. That would be so, would it, if four dollars was correct instead of two dollars?

A. Yes.

Q. So that would be about five million dollars more, because the testimony is that Astoria costs over four dollars instead of two dollars per thousand feet, and that would make a total of how much?

A. $47,595,762.08.

5302 Q. Now, won't you be good enough to add to that this $1,017,220 which you took out on account of active mains, two, three, four and five inch, actually in use?

A. $48,612,982.08.

Q. And if you take the mileage of mains of Mr. Simpson, 822, instead of the mileage which you computed from the measurement of the map, and your valuation of a little over eight million dollars for such 822 miles, assuming the mileage to be correct, that would mean an addition of about nine hundred thousand dollars more on account of mains than your computation for the active mains, and if we added that nine hundred thousand dollars to that last total that would give what?

A. I compute for you $49,512,982.08.

Q. Yes, and we are not quite through yet, Doctor, because we have not yet in this valuation the engineer and superintendence expenses, and the sewering and draining and cutting and filling, and so forth, which the engineers have testified would cost the company ten per cent., and if we assume that that be so, your figures should show it. Ten per cent. would be $1,193,872. Would you favor me by adding that?

A. $50,706,854.08.

Q. But we have not added any interest yet of five per cent., being the average which seemed to meet almost everybody's views, and you testified that that was $656,624, and that added to the last figure would make how much?

A. $51,363,478.08.

Mr. Burr: I think it is very objectionable in having the Doctor act purely as a computor. You might as well argue this in your brief, Mr. Mathewson.

Mr. Mathewson: I am practically through. I might say I am through, but it seemed to me that by consecutively taking the Doctor's computation it was quite fair.

5303 A. Acting as your computor, $51,363,478.08.

Q. Now, Doctor, in this little book which you wrote and of which you kindly favored me with a copy, I find that in your estimate of construction of an electric railway, for instance, or similar design, you have not only "preliminary and legal expenses" in there, and "grading and bridging" at a large amount, but you finally, at the end, add ten per cent. for delays and overseeing only; that is, ten per cent. of the cost of the plant, including in such cost the "preliminary and legal" and the "grading and bridging;" that is correct, isn't it?

A. Yes. That, however, is an estimate in the inception of the construction of a railway. It differs entirely from an inventory in which everything to be inventoried is either in sight or on record.

Q. Oh, I quite appreciate that, Doctor, but if we are going to work to construct a gas plant new, I think you conceded yesterday that the company would have to have engineering, they would have to lay out the plant, they would have to have superintendence, they would have to drain the ground, especially if it was this low ground; they would have to cut and fill, they would have to do some sewering, and they would have to do various other things, which is a charge upon the company beyond what they would pay contractors merely for building the buildings and installing the apparatus; that is right, isn't it?

A. All of which I allowed in my figures.

Q. And I am approaching now from the company's standpoint—but you did not allow in your estimate of figures for cost of apparatus delivered, as you testified, the engineering expenses in getting street permits and in drawing the design for its own plant originally, no part of which would go to any contractor?

A. All of that was allowed for both in the street mains and also in the figures given by me, and liberally allowed for.

5304 Q. But I am talking about the plant itself?

A. About the plant itself.

Q. Didn't you testify yesterday that your estimate of the valuation of these pieces of apparatus was the estimate of the value delivered at the plant? You had not added any part of the engineering expenses of the company as distinguished from the engineering expenses of the contractor?

A. Very possibly. A most liberal allowance was made in the figures which I have put down in the items for the various forms of detached expense, particularly the case of the buildings, where I added fifty per cent. and five cents per cubic foot for pile foundations. It was an overwhelming addition from my point of view, made simply with the object of being fair, and more than was liberal.

By Mr. Burr:

Q. And that is true all through your estimate?

A. That is true all through, from beginning to end, street mains, buildings, apparatus——

By Mr. Mathewson:

Q. Will you take one single piece of apparatus? Take, for instance, the engines which have been installed, in your testimony here and in your schedule, and tell me how much of that you allowed for engineering expenses of the company in sewering its plant and grading its plant and designing its works and expense of street permits, and things of that sort?

A. Taking the——

Q. I want you to do this; I want you to point out some specific item, so that I can test it by the maker of the apparatus and see if that includes this additional expense which the company has to go to, and which the contractor does not receive?

A. Taking the street mains——

Q. No, you are here valuing the plant.

5305 A. We are talking of street permits, if I understood your inquiry.

Q. No, I am simply talking about permits around the buildings while they are constructing the plant, for placing the material on the sidewalks, and so forth. I am confining myself to your testimony respecting valuation of the plant. If you referred to the street permits when saying that you excluded the engineering expenses, why, I have no further questions to ask, if you understood me to mean that?

A. You spoke of street permits?

Q. Yes.

A. For them as well. Do you wish them?

Q. When we construct a plant we have to pile material in the street all about the plant and we have to have permits for that purpose?

A. A mere trifle.

Q. Oh, no, not a trifle at all; a very substantial, as you would know if you erected buildings in New York City. But you referred when you said you had included engineering expenses, street permits, etc., to the mains, rather than to these individual pieces of apparatus?

A. The matters of the street permits to which you are referring certainly included more than ample allowance for them all. With regard to the street permits for piling brick on lots, they have a great abundance of room.

Q. Well, you said you allowed nothing for street permits?

A. I allowed nothing at all. As far as regards the sewering and general work, and particularly the difficulty of sub-aqueous construction, where piling is involved, I regard my allowance as abnormally great, far too great.

Q. Let us eliminate street permits, and I ask you to point out one of these pieces of apparatus, engines, or something else to which you have testified, and tell me how much you were allowed there for engineering expenses of the company, the cost of steam
5306 pumping, sheet piling, water in the boilers, temporary blocking, the sewering and other things which the company does not leave to the contractor, but which the company has to expend itself in laying out and supervising the construction of a plant?

A. I tell you that in those matters the foundation and buildings, and also the machinery——

Q. I am talking of apparatus?

A. And also the apparatus that in order to more than cover it I added fifty per cent. or five cents per cubic foot to every building that had pile foundations.

Q. That is a different proposition, I am not talking about the pile foundations because you would have to pay the contractor to put in the piles. I am simply talking about the expenses of the company itself; that is, its own engineers for laying out its plant, for supervision, for superintendence, for draining its land, and for various other things which would go into the company's expense, delays, overseeing, etc., which you add ten per cent. for in this particular structure?

A. It is quite possible for the company who has kept its records of this to make those statements if they wish to do so, no mortal man lives who can do more than I have done, just make more than a liberal allowance for any proper extra expense.

Q. That is not the point. Can you point out any piece of apparatus there and tell me how much you allowed there for that engineering as distinguished from the amount which goes to the contractors on that piece of apparatus?

A. I have answered you as fully and completely as it is in the power of any engineer to answer you unless he has access to your books.

Q. Well, I am talking now about your allowance?

A. And I have done it by more than a liberal allowance for space.

5307 Q. Is that the best and final answer you can give?

A. It is.

Mr. Mathewson: All right. That is all.

Redirect examination by Mr. Burr:

Q. I notice in your testimony that you have referred to some unused plants or parts of plants, and the consequent unavailability of output. Can you give me a little more in detail what the total summary of that is?

A. In going over these plans I noticed, as I went along, a number of retorts which were out of use in the various buildings and stations. These are out of use in December when it is supposed, if at any time in the year, that the apparatus of the gas company will be in full operation. The following is the estimate of unused gas retorts and the capacity. At the

14th Street station, retorts not used..........	324
42d Street station " " "	408
44th Street station " " "	60
21st Street station " " "	276
99th Street station " " "	132
111th Street station " " "	242
Total retorts not used..............	1,442

By Mr. Mathewson:

That is the summary of the individual items in your previous tables, isn't it?

A. Yes, these 1,442 retorts, assuming the lowest four hour charge of about two hundred pounds would carbonize twelve hundred pounds of coal a day each or 1,730,400 pounds of coal. This

1,734,400 pounds of coal at five cubic feet of gas would give 8,652,000 cubic feet of gas a day, or assuming two hundred days to the year an annual capacity of 1,730,400,000 cubic feet. This, 5308 assuming the total structural cost to be about two dollars, leaves out of use apparatus to the amount of $3,495,408. I have not included 360 abandoned retorts in the 18th Street station.

Referring to page 5109, Consolidated Gas Company, estimated cost per annual one thousand cubic feet of sales for 1905, and adding 1,730,400,000 cubic feet to 10,419,461,000 cubic feet, it would give when divided into $12,263,943, an average cost per annual thousand of $1.01 for the gas which would be manufactured by the Consolidated Gas Company's own works, and that would result, adding eighty-four cents for the distributing system, in an average cost of $1.85, instead of $2.02 per annual thousand cubic feet of sales. In taking five cubic feet of gas to the pound of coal——

Mr. Mathewson: Don't you think you have gone about far enough on this? It seems to me so.

Mr. Burr: I have asked him a question. Let him finish.

Mr. Mathewson: I think he has finished.

The Master: He is answering no question that I can see. I do not think that it has anything to do with the redirect-examination or anything that we are supposed to be proceeding on now under the order of the Court. This is not as to the value of the plant at all. He is making an oration now of what might be done with the plants he has not valued.

Mr. Burr: I object to the use of the word "oration" and I except to your ruling that he should not proceed, if you rule that way.

The Master: I have not ruled that way, Mr. Burr, but Mr. Mathewson draws attention to the fact we are getting pretty wide of the mark, and I think we are. If the Doctor is about 5309 through I suppose there is no objection to his finishing it.

By Mr. Burr:

Q. Have you about concluded?

A. That is about all that is necessary.

Q. I understood you to say yesterday that you knew the cost of slating, but you did not know the price of slaters. What did you quite mean by that?

Mr. Mathewson: I merely asked yesterday whether he knew and he said he did not. Now I suggest it is not proper to go and look up afterwards and be able to tell to-day what the cost of slaters is. I asked him in reference to his estimate yesterday, the basis upon which he made that, and he did not know.

The Witness: I could not recall at the moment the slaters' daily wages. It appears to be about forty cents per hour with a helper at twenty cents per hour (page 525 of *Gillette's Handbook of Gas Data*). The cost of a square foot of slate roof appears to be ten cents from the same authority.

Q. Will you be good enough to tell the Master a little more in detail what method you pursued in arriving at the unit of gas in reference to these various buildings and apparatus?

A. The statement that the buildings of different sizes have a uniform cost per cubic foot is radical and fundamentally wrong.

Mr. MATHEWSON: If you will permit me to interrupt, the witness stated in detail exactly that yesterday, Mr. Burr, and began with exactly the same words, and then went on to say that he took 5310 the 132d Street building as typical and then proceeded to use that as a sort of a unit for the others.

Mr. BURR: I agree with you. He may start from the same point, but I asked him to elaborate a little.

The MASTER: If that is objected to I will sustain it. I do not like that kind of redirect-examination, Mr. Burr. It gives a witness too much latitude. If you have anything you want to bring out, ask the specific question, but if you ask him to explain to me a little further, he might go along for an hour and the other side have no redress. The complainant is entitled to have these questions put in a legal form. If you want anything brought out to strengthen this witness's testimony on his redirect-examination, ask him the questions, but it is not fair for the other side if they object for you to give the witnes- a question and have him run through a discourse lasting ten or fifteen minutes at a time.

Mr. BURR: It understood I was in a court of equity, and this gentleman had undertaken to explain why he made a certain allowance and arrived at a certain figure as a unit of cost.

The MASTER: I shall have to hold you down to questions.

Mr. BURR: Mr. Mathewson cross-examined with regard to it, and I was getting for your benefit a little more of the detail. If you do not desire it, I won't ask him further.

The MASTER: I will take my chances on such questions as you ask him, rather than give him the discretion in the matter, a discretion that few witnesses can exercise property, so far as my experience goes.

Mr. BURR: Very well. I take an exception.

5311 By Mr. MATHEWSON:

Q. Referring to these retorts——

Mr. BURR: I object to that. I am excluded from asking anything, and now you begin.

Mr. MATHEWSON: I am going to ask as to the retorts—a matter you brought out on redirect, when he told of the retorts not in use, how many per thousand, how much money, and all that.

Q. You understand, do you not, Mr. Marks, that your totals of output per annum for these retorts which you found not in use, and your estimates of values of plant, etc., were based upon these retorts being out of use during the entire year, and no gas being made in them during the entire year? In other words, your computation of the total amount of gas was possibly only assuming that they produced no gas during the year?

A. No. It was based upon another view than this, at a period of maximum demand during the year.

Q. Well, but they were out of use, in other words, practically for the entire year? You might just as well not have them, according to your computation?

A. If you cannot use them at the time of the maximum demand you might just as well not have them.

Q. Don't you know you have to put retorts out of use for scurfing constantly?

A. Yes.

Q. And even in the time of great production you have to put some out of use, and the more gas you produce the more scurfing is required?

A. That is all allowed for, you know, in the two hundred days instead of three hundred and sixty-five.

Q. Well, that is true, isn't it?

A. Yes.

Q. So that, even in the period of greatest production you do not continuously have them working, or have every retort working, but some necessarily are out of condition for scurfing from time to time, isn't that so? 5312

A. With an able engineer, there are mighty few in December that are out of use for scurfing. Things are fixed.

Q. How about from November to January, when your use of gas is great? Isn't it necessary to put retorts out of use for scurfiing in well-managed gas plants during that period at all?

A. A few, a very few, possibly.

Q. What percentage?

A. Perhaps a fraction of one per cent. Everything is kept going full tilt.

Q. Except a fraction of one per cent.?

A. If you are posted on your job.

Q. (Question repeated.)

A. Yes; in the month of December.

Q. Do you know whether a shortage of gas coal has existed within the last thirty or sixty days which has affected the operation of retorts abnormally?

A. It would not affect the existing conditions of retorts if it did exist.

Q. I am asking you about the operation of retorts, *there* being out of use or not out of use for a few days at a time, that would, would it not, so far as coal gas plants are concerned?

A. Not at all. In a well-managed company a good manager would have his stores of coal piled up sky-high by November.

Q. Do you know of any gas company in this country which did have its coal stored up sky-high at the time of the coal strike in 1902 and 1903? And don't you know that every company practically in the country that amounted to anything had to scrape for coal, and pay almost any price for it?

Mr. Burr: Objected to as incompetent and irrelevant, and it embraces two or three questions; it is indefinite.

Question allowed. Exception.

A. It is too indefinite to answer. There are all kinds 5313 of managers, and they were having all kinds of times then.

Q. I am asking about all kinds, because I am referring to the plants in general. And you cannot answer it?

A. To plants in general?

Q. Yes?

A. No.

By Mr. Burr:

Q. What do you mean by the two hundred days that you spoke of in relation to these gas plants?

A. There are three hundred and sixty-five days in the year, but it is necessary for the purpose of scurfing, repairing, taking out retorts, renewing them, and for all the various breakdowns and troubles that occur in a gas works, to make an allowance. This two hundred days a year is not a theory; it is a condition which has been found by long use, by experience in gas works.

Mr. Mathewson: That is conceded. Every witness has said that.

The Witness (Continuing): And that, therefore, when you find the daily capacity of the works, we will say, to be a million, its annual capacity would be two hundred million, and not as some folks would think, three hundred and sixty-five million cubic feet.

Q. So you have made allowance in your figures for this scurfing that Mr. Mathewson has spoken of?

A. For every kind of catastrophe and trouble and cleaning and fixing and alterations that is ordinarily known to occur in gas works.

Mr. Mathewson: It is not a question of allowance for that.

Mr. Burr: That is all. Now, Mr. Mathewson, have you finally arrived at a conclusion as to those two letters I handed to you?

5314 M-. Mathewson: Yes. I shall not object to their going on the record in view of the broad way in which the case has been treated by the Master and the Court, assuming you won't object to similarly good information on our part.

Mr. Burr: I am not certain whether I offered this in evidence before or not. It is the so-called "Remsen Bill" I so offer it now.

Mr. Mathewson: It is not claimed that this bill ever became a law or affects the situation. It is objected to as incompetent, immaterial and irrelevant.

The Master: I will exclude it.

Mr. Burr: Exception.

The Master: It may be marked for identification.

Marked for identification City's Exhibit 136.

Mr. Burr: I want to offer in evidence the compilations of Dr. Marks with regard to the inventory, being the sheets marked heretofore City's Exhibits for identification 125 to 135, both inclusive.

The Master: Those are what, the details?

Mr. Burr: Yes.

Mr. Mathewson: I object to this, Mr. Master. It has not been offered in evidence so that I might have cross-examined upon it.

Mr. Burr: I beg your pardon. You have been cross-examining, since you had him under cross-examination, from those sheets that I have already handed you.

Mr. Mathewson: No. Secondly, the sheet contains numbers of things which are not in his own testimony; for instance, "Rowland's actual cost in 1884," which may or may not purport to be something which he has taken from the schedules here in evidence, and which I question very seriously, and I might have to go into this
5315 in detail. Here is "Mayer's cost." I don't know whether that is so or not, whether that is the original cost of depreciation. It appears to be original and the following is depreciation. I don't know that I have any very serious objection to this thing if it is to simply cover Mr. Mayer's own details. Or if it is to take in Mr. Mayer as well, which is in testimony here, but as to the summarizing of what is supposed to be Rowland's valuations as though they were parallel with these valuations of Mr. Mayer and Mr. Marks, whereas they are not at all, but the buildings have been changed and Rowland did not include the foundations of apparatus with his buildings and other things, it is not proper and it is entirely misleading.

The Master: I do not see that it can come in here, not having any evidentiary force. That is, Mr. Marks and Mr. Mayer have been here subject to cross-examination, and Mr. Rowland has not.

Mr. Burr: You understand the purpose of that elaborate series of schedules is for the purpose of informing you by comparison as to the various valuations that have been placed upon the same identical things from 1884. Dr. Marks is still here, and if you doubt the correctness of his figures as to what he assumes and states there to be the Rowland valuation, he is here to be cross-examined. If you doubt your own witness, Mr. Mayer, as to the correctness of the figures placed by Mr. Marks in that inventory, he is here to be examined as to that. You know the figures he has given there which Mr. Mayer has presented are absolutely correct. You have yourself offered in evidence a different part of this inventory, the
5316 Rowland inventory, and he has taken from this inventory now in evidence the figures or his values.

Mr. Mathewson: He has not, and you have not proved and cannot prove that the buildings Rowland appraised in 1884 are in the same condition to-day that they were then, because there has been something like eight million dollars in repairs and replacements on the buildings since 1884.

Mr. Burr: We will leave you to prove that.

Mr. Mathewson: Secondly, what Rowland has included in his appraisal of buildings, whether he included foundations of apparatus or not, is quite another proposition, and they were both included by Mr. Mayer and Mr. Marks. You offered these sheets to me the other day, saying they would be of assistance, and I said they would be and they might shorten my examination, and they have been used simply for that purpose.

Mr. Burr: And you have shortened it?

Mr. Mathewson: They have avoided a lengthy cross-examination probably, and I certainly object to any testimony of this witness which would be merely taken in as Rowland's valuation as compared with the valuations of buildings which he has seen to-day.

The MASTER: You can hand that in in the form of a brief. I should imagine it might be of some assistance, but I do not see that it is evidence, Mr. Burr. I think it is well enough off as it is, marked for identification.

Mr. MATHEWSON: This shows the cost per cubic foot, which Mr. Marks has assumed in reference to each one of these buildings, and the corresponding value of the buildings, multiplying the cost per cubic foot, assumed by the cubical contents which he has figured out.

5317 Mr. BURR: The valuation Mr. Rowland placed upon all these various plants and buildings, as I already stated, is in evidence now. The method by which Dr. Marks arrived at his valuation is shown in elaboration here, and more in detail than in the inventories that are already part of his evidence.

Mr. MATHEWSON: I am not going to object if you want to offer the details here of Dr. Marks' estimate of the valuation of these different buildings, which appear in the sheets which you handed me, but I shall object distinctly to your coupling the Rowland valuation with that save they were valuing exactly the same thing at the same time.

Mr. BURR: I will accept that offer. There is no objection then to that part of the inventory which shows Dr. Marks' valuation and the details of his valuation. The only objection is to coupling with that the Rowland valuation and, as I have already stated to the Master, Rowland's valuation and inventory is already in evidence here so for your own assistance and guidance and aid, I insist that they both should be received at the same time.

Mr. MATHEWSON: You mean Rowland's?

Mr. BURR: Yes.

Mr. MATHEWSON: If Mr. Rowland had been here and seen these buildings at this time as they now exist and had put a valuation on them, I would not for a moment object to your putting his valuation in one column and another witness's in the next column, for comparison, but you are not comparing the same things.

Mr. BURR: Why did you introduce that appraisal at all, then?

5318 Mr. MATHEWSON: Simply to show the value of the property and how the stock was issued at the organization of the company, as we were by law required to do.

Mr. BURR: Has it no other bearing or effect upon this case?

Mr. MATHEWSON: I won't say that. That was the primary object for which I have offered it. You think it has various objects, you so argued it?

Mr. BURR: Still I insist in offering those schedules in evidence.

The MASTER: Where in the record was the Rowland valuation?

Mr. BURR: The buildings are still existing, they are of the same dimensions as Rowland gave, and we would be entitled to show, if you were putting this in evidence for the purpose of justifying your capitalization in 1884, that those buildings no longer existed, if they did not exist, wouldn't we? Mr. Mayer has given the dimensions of all these buildings, they are still in existence and we have taken them just as given by Mr. Rowland in 1884 to Mr. Mayer in 1906. Dr. Marks is here ready to be cross-examined as to whether he has with accuracy given the valuation given by Rowland in 1884.

Mr. MATHEWSON: It is not necessary to cross-examine him. They are in evidence and you can do so if you choose in your brief.

Mr. BURR: You can.

Mr. MATHEWSON: No, we do not have to from your exhibit.

Mr. BURR: It is not my exhibit.

Mr. MATHEWSON: You are trying to make it such. It is one you are putting in here now.

Mr. BURR: I didn't have the pleasure of knowing Mr. Rowland.

The MASTER: Where is the so-called Rowland inventory in the record?

5319 Mr. BURR: Starting at page 179 of the Exhibit Book.

The MASTER: Well, I will take it, Mr. Mathewson, in view of what took place in regard to these other Exhibits 70 and 79; and give you an exception.

Received in evidence as City's Exhibits 125 to 135, respectively, and so marked.

Mr. BURR: I also offer in evidence the papers that have been previously marked for identification, City's Exhibits 103 to 120, both inclusive, being the schedules of mains as made up by Dr. Marks from the maps of the Consolidated Gas Company.

Mr. MATHEWSON: Those details of mains.

The MASTER: Didn't we argue that all out at great length?

Mr. BURR: No, we had no discussion with regard to them at all, because I simply had them marked for identification.

Mr. MATHEWSON: I think it was understood the summaries should go in, and not worth while to spread that immense detail on the record.

Mr. BURR: Well, I am putting it in and offer it as part of my case for the defendants in this action.

The MASTER: Is there any objection?

Mr. MATHEWSON: No, if the Master thinks it is a proper part of the case. I think it is utterly useless for the purposes of general evidence.

Mr. BURR: That may be in Mr. Mathewson's opinion, but it does not follow that it will be eventually useless.

Mr. MATHEWSON: I think you will find it will be worse than useless.

Received in evidence as City's Exhibits 103 to 120, respectively, and so marked.

5320 HENRY H. EDGERTON recalled for examination.

Cross-examination by Mr. MATHEWSON:

Q. Have you ever constructed any buildings in the City of New York?

A. No, sir.

Q. Have you ever done any excavating work or had any control of any excavating work or foundation building in the City of New York?

A. No, sir.

Q. Have you ever constructed a gas plant in the City of New York?

A. I advised in regard to the construction in the early days——

Q. Yes, the Mutual, you have testified to that?

A. Yes.

Q. But have you ever constructed a gas plant in the City of New York except so far as you advised as to the Mutual in the 70's?

A. No, sir.

Q. Have you ever built any structures in the City of New York?

A. No.

Q. Have you ever employed labor in the City of New York for construction purposes?

A. No, sir.

Q. Or for manufacturing purposes?

A. No. I have taken laborers from New York, that is, got gas men from here and employed them elsewhere.

Q. Now, you say that you have inspected all the plants of the company?

A. Yes.

Q. Will you tell me when you went to the 14th Street plant, when you entered it and how long you spent there and when you left?

A. I don't remember the exact date it was when I first got their permission to go in, and I went there I think three days in succession and spent probably four hours a day.

Q. That was the 14th Street plant?

A. Yes.

Q. That was the only plant that you had examined up to the time of the recess taken on the 10th of December, wasn't it?

A. I think so.

5321 Q. Now, what was the next plant that you examined after, I mean the plant after the first one, was it 42d Street?

A. I think 42d Street.

Q. Now will you tell me what day you went to 42d Street and what hour you went to the plant and when you left?

A. I can't tell the exact date without referring to some suggestions or memorandum that I haven't at hand. Possibly I went there an hour of the day and spent some time in getting in touch with it. I think the superintendent was out and I had to wait till he came back.

Q. You entered the plant on January 3d at about ten and remained till half-past ten, didn't you?

A. Oh, that was just merely to measure some thickness of some purifier metal and various others—to examine the docks. I had been there three times previous to that.

Q. Then you give me the date and the time you spent each time?

A. I think I spent about three hours.

Q. Can you give me the date?

A. No, I don't remember the date. I visited so many plants that I can't tell the exact dates of each. I spent probably four hours on my first visit to the 42d Street plant and possibly three or four hours on the second visit and then on the third I was there a couple of hours and in January I was there a short time just to check off things I had overlooked.

Q. About half an hour?

A. About half an hour. That was to measure the thickness of iron and see the condition of the docks again.

Q. Now, as to the 99th Street plant, you went there on Sunday, December 23d, didn't you, in the morning?

A. Yes. I went there. I don't remember the exact date. It was Sunday.

Q. Sunday, December 23d?

A. Yes.

Q. You went in the morning and remained till about half past twelve, did you not?

5322 A. I don't remember the exact time. I went from there to the——

Q. Wasn't that about the time you were there?

A. I wasn't there over two hours, I shouldn't suppose.

Q. And then you went to the 132d Street station, did you not, and you spent about two hours at the 132d Street station on the same day?

A. I didn't go to the 132d Street on that day.

Q. When did you?

A. I went to 132d Street several times and I cannot remember the exact dates.

Q. It was January 3d, I think, that you went to 132d Street, wasn't it, and remained from about twelve-thirty to two-thirty?

A. I think about that time.

Q. Now, on January 3d you also went to the 111th Street station, did you not, about two-thirty and remained how long?

A. Long enough to measuse up the pressure on the gas holders, that was my object in visiting those stations.

Q. Well, how long did that take, half an hour?

A. I don't suppose it took over an hour to measure the gas holders for pressures where I was facilitated at all.

Q. Now, the 63d Street station you visited on January 1st, did you not?

A. I don't remember the date I visited it. I took the pressure of the gas holders and looked around.

Q. How long were you there?

A. I don't think I was there over an hour. It was in the evening.

Q. The 65th Street station you also visited on January 2d, did you not, from about quarter of three till quarter past five?

A. 65th Street I think I visited two, possibly three times. I was there taking a count of the iron work and taking some photographs
of stations and holders and not having a gas fitter along to do
5323 some of the alterations required to take the pressures on the
holders I had to visit it again. I made two visits to 65th
Street.

Q. You visited it twice to take the pressure on the holders?

A. Yes, sir. I also was there to take a look at it before.

Q. Did you go inside before?

A. No, I didn't go inside; I went with a view of seeing what the state of the gas holders was, whether they were in use.

Q. How long were you inside the works altogether—two hours?

A. Probably five hours altogether, on both occasions.

Q. On all occasions?

A. Taking it altogether, I was there long enough to see all that I wanted.

Q. Now, as to 63rd Street, you visited the 63rd Street station on January 1st, did you not?

A. I think possibly, although I don't think that was the date. I measured the pressure on the holders; I think that was subsequently.

Q. How long were you inside the 63rd Street station?

A. Probably an hour and a half.

Q. All told?

A. Yes.

Q. Now, as to the 21st Street station, you went there, did you not, on December 23rd, about eleven o'clock, first?

A. I don't remember the date. I think it was likely about that date.

Q. And you remained until about two o'clock, did you not, on the day that you went?

A. I think that was about two hours, or two and one-half hours, going through that station.

Q. Then you called again at 21st Street on the first day of January, didn't you?

A. I called again and spent two or three hours there.

Q. And all that covers your inspection of the 21st Street station?

A. I think I was there once more.

Q. Well, was it before or after?

A. I think I made three visits there; I won't be sure about that, but I had to make several visits, you know, in order to get the gas holders.

5324 Q. In order to get the pressure?

A. Yes.

Q. How long were you there on the third occasion, if you did go a third time, an hour?

A. I am not positive about it. I think the two occasions embraced about all the inspection I gave to 21st Street personally.

Q. How long were you there on the second occasion? On the first you were there about two and one-half hours, you say?

A. Yes.

Q. And on the second occasion how long were you there in that station?

A. I had two gentlemen with me the first occasion. I think we went to 21st Street, and one on the second occasion.

Q. I know, but that is not the question. How long were you there on the second occasion?

A. I think between two and three hours.

Q. On the second occasion?

A. Yes. Possibly that.

Q. Now, respecting the 44th Street station, you went there first, did you not, on December 19th?

A. The first station I visited after 42nd Street was 44th Street.

Q. That was December 19th, wasn't it?

A. I have forgotten the date. I did not put those down. I didn't have any idea there was any importance in what date I went there.

Q. I do not care particularly as to the date. I am merely getting the time, whether it was December 19th or December 20th. You remained there for what period? You left about half-past one, didn't you, and when did you arrive?

A. On the first occasion I went there to measure the holders and make some measurements around the place, and I don't think I got those—I visited it again, taking a few of other parties and measuring the holders. I spent quite a little time in 99th Street, six or eight hours altogether.

Q. Did you go more than twice?

5325 A. I think possibly I did. I don't think I got all the measurements I wanted first.

Q. Isn't it a fact you went December 19th and remained until about half-past one o'clock P. M., going in the forenoon some time about eleven o'clock?

A. I wasn't there, not at the station, the first day.

Q. And the second day, didn't you arrive about twenty minutes of twelve and leave about half-past one?

A. I didn't take note of the time.

Q. Well, about that, wasn't it?

A. Possibly. I got through.

Q. Now, take the 18th Street plant. You visited that, didn't you, on December 20th, or about that?

A. Somewhere along there.

Q. And you arrived there, did you not, about half-past two in the afternoon?

A. It was in the afternoon. I stayed there till two, I suppose. I suppose I spent three hours around the 18th Street station.

Q. Did you go into the Inwood station, inside that station?

A. No, sir.

Q. 132nd Street station?

A. Yes, sir.

Q. How long did you spend there in that station?

A. Possibly three hours.

Q. I think I asked you about that, and you said it was possibly from half-past twelve to half-past two. Now, does this cover the time you spent in the various stations of the Consolidated Gas Company?

A. Oh, no. I have been in those works from time to time ever since 1873 or 1872.

Q. I refer to going there for the purposes of the testimony here.

A. This is for this examination, to see what was there, yes, sir. That comprised the time which I used for looking over and comparing these inventories.

Q. And to see the condition of things now?

A. Yes.

Q. You never made an examination for the purpose of testifying so far as the Consolidated Gas Company plants were concerned before, did you?

5326 A. No, sir, not for the purpose of testifying. I have visited them one hundred times, though.

At 1:05 P. M. a recess for lunch was declared till 2:20 P. M.

After Recess.

Henry H. Edgerton resumed.

By Mr. **Mathewson**:

Q. Which plants of the Consolidated Company were you inside of within the past ten years, before the beginning of this suit?

A. I think I have been in most all of them.

Q. Well, name them?

A. I don't—that is not the holder stations, but the works.

Q. Well, 14th Street?

A. Yes, I have been in 14th Street.

Q. 21st Street?

A. I don't remember 21st Street—yes, within ten years I have been in the 21st Street station.

Q. Within five years?

A. I don't think I have within five years, no sir.

Q. 42d Street?

A. Yes, I have been in 42d Street within ten years.

Q. Within five?

A. No, sir; I don't think I have.

Q. 44th Street?

A. It may possibly be ten years ago; I know they were using the Tessa de Moto process at the time I was there last.

Q. 99th Street?

A. I have not been in 99th Street since Balmore was there years ago—no, that was the Harlem. I have not been in there, no, sir, for years.

5327 Q. And the holder station you say you have not been in before the suit?

A. No.

Q. But in these visits years ago to some of the manufacturing stations you did not go for the purpose of making an engineering inventory?

A. No, sir; I was just looking at their apparatus and seeing what they were doing and accomplishing and so on.

Q. In a general way?

A. Yes, sir.

Q. Now, you say you tested some measurements and in some instances you found Mr. Mayer's measurements did not coincide with yours. Taking them altogether was there any substantial difference?

A. No, I don't remember any. I think there was in the width of a condenser in one place and some others, which were immaterial. I did not check off, however, only those that I judged from my eye to be different from the measurement.

Q. And when you give your view of the cost of a coal gas plant at $250 to $270 per thousand daily capacity and for a water gas plant, $125 to $130, and an oil and water gas plant, 50-candle power, at $100 per thousand, what do you include in the word plant in those totals?

A. Everything.

Q. Do you mean land?

A. No, sir; not land; everything that is in the shape of construction.

Q. Do you mean manufacturing plants, holders, connections and apparatus?

A. And apparatus throughout.

Q. For the manufacturing portions of the plant?

A. Yes, sir, and storage.

Q. How much holder capacity do you allow as related to the generating capacity in your estimate?

A. The holder capacity I predicated generally upon the maximum day's output?

Q. Did you allow holder's capacity equal to the maximum output?

A. Not in this case.

Q. What did you allow?

A. I allowed 45/67ths.

5328 Q. In both coal and water gas?

A. Yes. I cut it down for this particular case for the capacity as I found it, that is the holder capacity relative to the manufacturing capacity.

Q. That is lower than the customary capacity in a coal-gas plant, is it not?

A. Yes, sir.

Q. About one day's holder capacity for a coal-gas plant is the rule, is it not?

A. That is the rule, maximum.

Q. And what about water gas?

A. Water gas could be shaved closer on account of the great rapidity with which it can be generated; but at the same time I allowed a maximum day in that case.

Q. 45/67ths?

A. 45/67ths, and I took 67,000,000 as the maximum output.

Q. And 45,000,000 as the holder capacity?

A. And 45,000,000 as the holder capacity.

Q. How about the oil and water gas, the same thing?

A. Well, the oil and water gas capacity is based upon 22 candles, that is a 22-candle gas. If I should make 50-candle gas for enriching purposes I should prorate it to the 22 candles.

Q. Now, you were examined somewhat at length in reference to the 14th Street plant when you were on the stand before, were you not, Mr. Edgerton?

A. Yes, sir.

Q. And does the schedule which you now present in relation to the 14th Street plant here duplicate the figures which you gave on your previous examination?

A. I believe so, with the exception that I did not get in the holders and some of the plants; I believe the purifier boxes were left out.

Q. And they have been included in your present estimate?

A. Yes, sir; I think they are included; they are intended to be.

Q. You show in your recapitulation of the 14th Street plant $498,806 for the value of the apparatus and contents as 5329 against $578,940 by Mr. Mayer or about $80,000 less for you. Was this estimate of Mr. Mayer the estimate without depreciation, I mean without deduction of depreciation?

A. I believe it was—no, I believe his estimate included depreciation.

Q. That is depreciation deducted?

A. Yes, sir.

Mr. KIRBY: But did not include addition for——

Q. But you deducted very much more depreciation than he did, did you?

A. I think my depreciation is somewhat larger than his, yes, sir.

Q. Is not the chief difference between your figures and his as to value of apparatus at 14th Street the difference in your allowance for depreciation? In other words, the original cost new does not differ greatly, does it as between your figures and Mr. Mayer's for apparatus at 14th Street?

A. I do not think it differs greatly. I cannot——

Q. Have you the totals figured up of the value of buildings, apparatus, yard connections and holders at these various stations reproduced new without depreciation so that we can compare that total with Mr. Mayer's?

A. No, I think only the value of apparatus with depreciation is carried into the recapitulations.

Q. I see that in your schedules of the various plants throughout in many places you say "value as per Mayer," and then carry into the second column of these schedules the depreciated value which he gave.

A. No, I carried out my own figure of depreciation.

Q. But in many cases you will observe you say "Mackenzie Exhauster at 14th Street, page 10, as per Mayer $3,050." That is the depreciation value given by Mr. Mayer, is it not?

A. Yes, sir.

5330 Q. And in such cases as that, if we were to determine the original cost, we would fill in in the first column where you have filled in nothing, Mr. Mayer's value new undepreciated?

A. That would be correct. I think his depreciation value on those was very slight, however.

Q. And where you give a depreciation value of a piece of apparatus not according to Mr. Mayer, and yet have nothing in the first column which represents original cost, you then would put in the first column the same value as you put in the depreciated value column, would you not?

A. I don't know as I have any such, Mr. Mathewson.

Q. I think perhaps there may be one or two there, probably insignificant, but if there are any, that would probably be right, would it not?

A. I think so. I do not——

Q. I think I observed one or two, but I think you probably left out the words "per Mayer" in that particular instance.

A. It is possible, because I have not checked this off very thoroughly. I have still to make a few corrections here. I have a tabular statement of some of them, but I have not had an opportunity to examine it minutely enough to check off all the errors.

Q. Take the 14th Street plant yard connections on page 2 of the summary, it seems to be; it would be page 15 of the 14th Street plant if the pages did not stop at 12——

The MASTER: I suggest you make as little reference to these pages as you can, because I understand that that is all to be printed, and if it goes in the minutes it will be confusing.

Mr. MATHEWSON: All the pages I have referred to so far are the typewritten schedule that I have, and not the printed schedule.

5331 Mr. KIRBY: I might state that these pages could be followed in the printing, because the buildings, the apparatus and the yard connections of each station are all numbered, commencing 1, 2, 3 and so on.

Mr. MATHEWSON: I will simply then refer to the recapitulation of the connection at the 14th Street station.

Q. You have valued them at only $25,500, whereas Mr. Mayer's value is $146,895, which Mr. Marks says he considers correct and has adopted. Now, do I understand that your $25,500 is based on your consideration of the capacity of the plant and the connections which you would usually find in a plant of such capacity?

A. That is based upon a factor which is the result of the aggregation of the experience of a number of gas men in regard to the value per unit of output.

Q. I am talking about you, so far as you are concerned; do not bring in any other gas men, because we cannot examine them. That is based upon an estimate by you based upon the capacity of the plant, then?

A. Yes, sir.

Q. And it is not based on any particular mileage of connections or individual consideration of these different items in the connections, is it?

A. Well, in looking around the plants, I had no reason, unless there was a duplication of pipes, to consider that the ordinary allowance for the proportion of valves and connections would be too small.

Q. No, but if you take Mr. Mayer's schedule showing the pipes and size of valves that exist, etc., and the number of feet as shown in his schedule, it certainly would amount, if figured up, to more than $25,500, to reproduce, would it not?

A. Certainly. I took that to be, however, a case that happens in many plants, that as they grow there is a duplication of parts. 5332 It frequently happens that as a plant grows and connections are enlarged that there is a certain amount of duplication.

Q. That is almost necessarily the case, is it not, as a plant grows and is enlarged from time to time?

A. They put in larger pipes, and the smaller pipes go out of use and it does not pay to rip them out, the foundations, etc.

Q. And you took that into consideration instead of the pipes in Mr. Mayer's schedule, and the connections?

A. Yes, I did not see how such a very large amount of pipe could be used to connect the apparatus, no.

Q. Did you include all the tar and drain pipes and steam pipes and water pipes?

A. Yes, that allowance includes all these tar and drain pipes, that is such as are used in connection with gas; not for sewage purposes.

Q. But upon your own estimate of what they might be instead of upon Mr. Mayer's testimony as to what connections there actually are there?

A. Yes. I consider that sufficient to convey the gas around the works and take the tar off, in a new plant.

Q. Let me call your attention to the six holders at 14th Street which you valued at $146,600. Mr. Logan's valuation is $180,000 and Mr. Mayer's $178,885. Now, in view of the experience of these gentlemen in the construction of holders in the City of New York are you still prepared to say that it would cost only $146,600?

A. I happened to have——

Q. I merely ask you whether in view of their testimony and their experience in New York City you still, on second thought, wish to say that the value of those holders, cost of reproduction, would be only $146,600?

A. That is the whole question? *A.* Yes.

5333 Q. Now, take the two holders following, which Mr. Logan valued at $40,000, and you valued at nearly one-third off, or $27,360; in view of Mr. Logan's experience, do you still feel that your figure is right?

A. Yes, Mr. Logan sells the holders and I buy them.

Q. What?

A. Mr. Logan sells holders and I buy them. I buy them as cheap as I can get them.

Q. And Mr. Logan has had experience in installing holders in the City of New York?

A. Yes, and I get bids on installing holders in the City of New York, too.

Q. It is a question of what kind of holders they may be. Can you tell me what weight you allowed for the six holders in computing your value of $146,600?

A. I could not get at the weight of those holders, but I based my estimate of the values of those holders entirely on what I had a bid for the construction of similar holders, only heavier.

Q. That would require us to examine somebody else, and we are now examining you. What weight did you assume in your computation of $146,600?

A. I had a bid for a No. 12 iron——

Q. No, no, no. That is not the question. I say what weights did you assume those six holders to be in material, entire construction, including the holder and the guide frame and connections, how many pounds of material?

A. I did not put it into pounds, because I could not measure it.

Q. Well, how many pounds would it represent in weight if the value was $146,600, because the value of a holder depends upon its weight, does it not, and the amount of material in it?

A. Yes.

Q. Let us see. What would you say the weight of these holders was, to equal $146,600?

A. I have not figured that up at all. I based it entirely on the capacity of the holder. As I say, those holders are counterbalanced, and I went there several times to take the pressures on them,
5334 and was always frustrated, in one way or another.

Q. Now, how were you obstructed, Mr. Edgerton?

A. Well, I went there with my apparatus, pressure gauges, and was going to measure them, and they—one thing is, they are out of use, and I asked Mr. Riblet to fill them up, and he said he could not then. I know better. I know——

Mr. Mathewson: I move to strike out "I know better."

The Master: Well, he said he could not fill them up.

Q. Do you mean that those holders are out of use, Mr. Edgerton?

A. I never saw them used at all.

Q. Well, do you mean to say that they were or are out of use?

A. Decidedly. I have gone to that place now about six or seven times to see those holders used, night and day, and never saw them in use. There were four or five of them sometimes down.

Q. Did you take any measurement of the holders at 14th Street?

A. I did of the big holders, but these small holders are absolutely out of use.

Q. Well, you are quite mistaken as to that——

A. He told me something about their being used at night, and I went down there at night or in the morning, because I wanted to see if there was anything in it, because I had made my mind up from observations that those holders were not in use. In one of them the water was down about fifteen feet, and it is perfectly absurd to say they are in use.

Q. What about these two holders you valued at $27,360? You have not the weight of those holders either, have you?

A. They are out of use now; they could not possibly be weighed. In the process—in regard to the two holders over in the other yard, 250,000 feet, I say that the water was down about fifteen feet
5335 in one of them when I examined it, and they were counterweighed. We would not have been able to ascertain the pressure. One of them, I believe, was up about four or five feet.

Q. I merely asked you whether you had the weight, or can you state the weight you assumed for those two holders?

A. I did not figure out the weight at all, because I did not have the data. I had to put it on the capacity, and I figured that cost out entirely on capacity per thousand, comparing with prices I have obtained.

Q. Does not the construction of the guide frame considerably alter the weight of the holder, or has not it something to do with the weight, holders of a similar capacity?

A. Oh, you can put——

Q. Just answer the question. It is a straight question, I think?

A. The weight of the guide frame has to do with it, certainly. The guide frame is part of the construction.

Q. Did you estimate the weight of the guide frames in the case of those holders?

A. Not in those holders, no, sir.

Q. How many cents per pound would you allow for the material in those holders?

A. I allowed from 6.6 cents to 7 cents a pound. I took Mr. Mayer's figures in regard to the cost on such as I could ascertain the weight of.

Q. Now, Mr. Mayer's value for the holders appears to be $789,604 including the tanks, and Mr. Marks says that he considers that a fair valuation, as you heard. Do you still think that $546,700, or thirty per cent. or more off, is the value?

A. Yes, sir.

Q. Does the price per pound remain the same whether the holders are in a steel tank or brick tank?

A. The price per pound would be slightly larger in a brick tank, that is of the whole apparatus.

5336 Q. How much larger, Mr. Edgerton?

A. I should not allow more than half a cent a pound for the difference between the holders and tank.

Q. Would the 6½ cents per pound be for brick or steel tanks?

A. That is the price that is generally used there for the holders themselves, and in some cases I used a slightly larger figure, 7 cents, and I think in one case 7.1 cents.

Q. Is that for brick or steel tanks?

A. That is for a brick tank.

Q. Now, referring to 42d Street apparatus, and the contents of purifier house, we have eight purifier boxes, with covers, which Mr. Logan valued at $40,000, and Mr. Mayer at $37,840, new. Your valuation is about twenty per cent. less than Mr. Logan's or $32,750. Will you tell me how many pounds of weight you assumed those purifier boxes, covers, connections and supports represent?

A. I can tell you the data on which I figured it out.

Q. Well, I would like the weight and the cents per pound which produced your $32,750.

A. I think it was five cents per pound for that plain cast iron work, ¾ of an inch thick at the bottom and ⅞ of an inch thick flanges, and I took eight pounds to the square foot as the weight of the covers——

Q. Being wrought iron?

A. Wrought iron. $1,500 is the cost of a centre seal and $800 the cost of a hoist, I think; that is my recollection of the elements which entered into those boxes.

Q. How many pounds of material did you make out for the boxes and covers, the whole thing which you valued at $32,750?

A. Cast iron sides and bottom, 40,110 pounds; columns and supports, 5,520 pounds; wrought iron covers, 5,213 pounds.

Q. Each?

A. This is for one purifier and multiply it by eight.

Q. Very good. Continue, or is that all?

5337 A. I-beams, supports, 4,600 pounds; trays, it all amounts to $2,609.38.

Q. How many pounds does it represent altogether for one purifier box with covers, etc., which you multiply by eight?

A. There being different classes of work, I did not add them together, but will do so.

Q. If it will not take you more than a moment, I would be glad of the total?

A. 55,443 pounds, that is exclusive of centre seals or carriages.

Q. And including the centre seals and carriages, how much would it be, and connections, if you have not included those?

A. Figuring out the weight of centre seals is rather complicated. I took it at the price of $1,500 for those centre seals, which would cover a centre seal of that size.

Q. You did not compute the weight of the center seals?

A. I did not compute the weight of the center seals, no, sir.

Q. Did you put in the carriages by weight?

A. No, the weight of the carriages. I took them, well, at about the same price Mr. Mayer does. I don't think my price differs from his.

Q. What price did you take for the carriages?

A. I think they were eight hundred or nine hundred dollars apiece.

Q. New?

A. New, yes. All this was new. I think Mr. Mayer's weights exceeded mine by the proportion of 69,000 to 57,000 or 59,000, something like that; they were a little more than mine.

Q. Now, about the four purifying boxes below with connections, supports and covers; Mr. Logan valued those new at $20,000, and you at $16,560, or nearly twenty per cent. less?

A. Those were four boxes about the same area, I think.

Q. Did you compute that on the same basis as to cents per pound of value for material?

5338 A. Yes, I took—all the purifier boxes are computed on the same data.

Q. Will you give me the details of the cents per pound which you assumed for your cast-iron work, including the cost of material, shop labor, weight, etc.?

A. Erected on the spot I think I figured it at five cents.

Q. How did you make that up in detail?

A. It would average about that.

Q. How much average price of material per pound?

A. You mean dividing it up as to shop labor and all that?

Q. Yes.

A. I did not attempt that. I was not doing shop work. I say this is on what I know from buying that kind of apparatus, the prices they put on and charge for it. I did not attempt to go into any shop details about it.

Q. Now from a manufacturer's standpoint as to what labor he would have to employ or materials to produce the result.

A. Right straight through I go on a theory that I am a buyer of gas works.

Q. I understand, and you do not divide that five cents up into details?

A. No, I do not know how they get at their figures, I know what I can buy them for when I get them.

Q. The same is true of each case where you have used a certain number of cents per pound as your multiplier?

A. Yes. I have classified the various details of the gas machinery into prices per pound as I got it from various parties, and I make up my mind from that, adding on these extraordinary New York conditions—of course all these prices, you understand, seem very high to me; I will say that, frankly, they are 20 per cent. higher than I am used to.

5339 Q. Well, they seem very low to us, so it makes a fair proposition perhaps. As you say you found Mr. Mayer's descriptions and dimensions substantially or generally correct, I judge that the difference between your valuations and his must rest largely in the number of cents which you allow per pound in cases where you were able to estimate the weight?

A. May be in the price per pound possibly, and in some of the weights, as I say, his weight of the purifier boxes was higher than mine.

Q. When did you last purchase any purifier boxes in New York City?

A. I have not bought any purifier boxes in New York City. I say that I have added on—in fact my figures or multipliers differ very little from Mr. Mayer's, as I recall it. I think his was 5.6 cents on that work and mine was 5 cents.

Q. How lately have you bought any purifier boxes anywhere?

A. I have not bought any lately. I do not use them in that shape. Those purifier boxes are out of date, anyhow.

Q. That may be, too; that is another story.

A. I could not get any figures on them one way or another.

Q. They were in use, were they not?

A. Yes.

Q. Now, as to the apparatus, Mr. Marks testified that Mr. Mayer's figures he considered substantially correct as to cost, they differing only in depreciation. Do you differ with Mr. Marks in that conclusion as to the 42d Street station?

A. I judge I do, from my view of it. He——

Q. Now, as to connections at the 42d Street station, you have them valued at only $22,950, while Mr. Mayer's value, approved by Mr. Marks, is $134,157, or something like six times as great. Did you make your estimate of these yard connections also on the capacity of the plant, instead of taking the descriptions of the connections actually existing?

A. Well, nobody could figure up any value from those descriptions. I had to throw that aside at once.

5340 Q. And as a matter of fact you did not take dimensions or have dimensions, but simply made an estimate as you did in the case of the 14th Street plant, is that right?

A. I estimated on the basis of the valves and connections required for a works of that capacity.

Q. Well, that is what you have said as to 14th Street, and you pursued the same course at 42d Street, didn't you?

A. Yes, sir.

Q. And each one of the other stations as to connections?

A. Yes, except on the holder stations. There I could figure in detail on the valves and pipes. I think I figured there on the details. It was not complicated with old stuff.

Q. Which station was that?

A. The old stations. Understand, these old stations are complicated with an immense amount of dead timber.

Q. How are these purifiers out of date, in what way?

A. Well, at the present date they will build them deeper; instead of shallow purifiers three feet in depth, they will build them six or seven feet, or even more, and put it in the depth instead of area.

Q. Do you mean to say that purifier boxes of that size are not erected to-day, or substantially that size?

A. They might where they use lime, or if they were old-fashioned folk, yes.

Q. Well, there are a great many purifier boxes of that sort existing, are they not, in plants which have grown up in the past?

A. Yes, that is the old style of box, all right.

Q. And if you think greater depths are better, cannot these be deepened?

A. I saw some effort to——

Q. Well, cannot they be? That is a simple question, not what you have seen, but *it is* not possible to deepen them?

A. They had better build new ones than try to deepen those.

Q. They could be deepened, could they not?

5341 A. You could use the cover, but the sides could not be adapted; you could put in new sides and deepen the sides and use the bottom perhaps, jack them up.

Q. Well, you know as a matter of fact, that it is something that is done every day in that business, to deepen purifier boxes, do you not, that it is constantly done?

A. Well, I have seen it tried, yes. I do not like it much——

Q. Yes, I know. It is constantly done, is it not?

A. — think I have put up second hand purifier boxes——

Q. Won't you answer my questions, Mr. Edgerton, and we will get on so much faster?

A. Yes.

—. Now, as a matter of fact, you testified in regard to the 14th Street plant, that a great deal of this apparatus, in fact nearly all of it, I think practically, and perhaps all of it, was apparently in use and it seemed to be doing the business, but that while it looked well enough on the outside you thought there must be some interior depreciation. Is that a fair statement of what you meant to say?

A. No—in regard to engines and exhausters and a lot of things of that kind, but there is plenty more of the large apparatus, that is very much depreciated on the outside, and as far as being all of it in use, it is very far from being all in use.

Q. But in the smaller apparatus, respecting which you testified at 14th Street that your depreciation represented a loss of life, or interior deterioration, the same testimony would be given by you respecting the corresponding items, or the depreciation which you have allowed for corresponding items in the other plants, would it not, generally?

A. Yes. I cannot see the insides of those machines, that is true.

Q. I am merely trying to find whether it is necessary to examine you on the other items in other plants of a similar character. Your method of depreciation would be substantially similar on the
5342 same items in other plants?

A. Well, on those exhausters and engines I should say I have put on a depreciation which would involve generally an overhauling of them and putting them in first-class order, which I considered that depreciation factor would about cover.

Q. Now, in reference to the holders at 42d Street, the first four, 250,000 cubic feet each, Mr. Logan's valuation of the holders is $120,000 and your valuation of these holders is only $73,900. Doesn't that shake your confidence in the figure which you have given?

A. No, sir.

Q. What weight did you assume for those four holders, including their guide frames, connections and the entire construction?

A. Those holders weighed more than I was told the pressure would account for. Mr. Mayer gave it, I think, 4½ inches; I found 5.2 inches.

Q. How many pounds did you calculate that would mean on the entire structure, including the guide frames and connections?

(Witness searches for a book.)

Q. Well, can you tell me how many cents per pound of weight you allowed in computing your value of $73,900 for those four holders?

A. 6.6 cents, I think, I figured on that holder shell, and I had the pressure at 5.2, and measured the submerged iron counter-balance by the water in the cup and then allowed for the levity of the gas in the holder .650 of air.

Q. But 6.6 cents, how many pounds would that leave for $73,900, about? It would be about 1,120,000 pounds, wouldn't it, Mr. Edgerton?

A. Yes.

Q. And didn't you allow the same unit value per pound for the guide frame and the connections as you did for the shell?

5343 A. No, I did not. That guide frame is a kind of a filligree casting, and I took that at, I think, four cents a pound; cast iron frame.

Q. I suppose taking the tanks and holders in the aggregate, the fact that Mr. Marks agreed with Mr. Mayer's total substantially as to original cost would not affect your view that the value was $40,000 or $50,000 less, would it?

A. No, accepting Mr. Mayer's figures would not affect my figures at all, nor my method of getting at it.

Q. That is true, I suppose, in every case where they agree?

A. In every case where they agreed. I looked at the thing in my own way and he looked at it in his.

Q. On the 44th Street plant?

A. I have explained there I do not think Mr. Marks in his——

Q. Well, I guess Mr. Marks is construing his own testimony?

A. I just went around with him on one works. I did not notice him figuring at all on that.

Q. In the 44th Street plant, the value of the connections you make $51,850; Mr. Mayer, approved by Mr. Marks, makes it $99,910. Is that still your view?

A. Yes. I allowed a little more for connections, on account of the water gas plant.

Q. Let us take the holders here at 44th Street, as you suggested taking up some others. Mr. Logan valued the four holders at 44th Street at $140,000; you value those same four holders at only $75,000, or at about fifty per cent. of his valuation. Now, will you tell me how much the entire weight of those constructions was, according to your computation?

A. Those holders, ninety-five feet six inches diameter, weight 203,300 pounds.

Q. Each?

A. Each one; and the guide frames at one-third the cost of the holder, I put that there to guide frames, I could not get particulars of them, and did not calculate that part, but took it at one-third the cost of the holder.

5344 Q. Do you mean one-third the cost or one-third of the weight?

A. One-third of the cost.

Q. What would that make for a guide frame for one of the holders?

A. Do you mean in weight?

Q. No, I mean——

A. $4,466.

Q. For each holder?

A. For each holder.

Q. What weight would that represent? Can you tell, about?

A. It would be about 100,000 pounds.

Q. Doesn't it make a good deal of difference how many columns there are in a guide frame as to the proportion of value of the guide frame to the holder?

A. Oh, yes. You could put a good many guide frames around there; the more guide frames you put the more cost it would be.

Q. Columns, you mean?

A. Yes, columns.

Q. Do you remember how many there were here, number of holders?

A. I think twelve. I think I have only got eight down here on Mr. Mayer's figures. Twice, I think, where he has sixteen, I have twenty once.

Q. Was this the case?

A. I do not state the number here.

Q. How many cents per pound did you take for the value of that holder?

A. 6.6 cents.

Q. What weight did you take for the connections for each holder?

A. 40,000 pounds.

Q. And how many cents per pound for that?

A. Two cents, plain pipe castings, except I allowed for valves in my calculations and connections.

Q. Doesn't the fact that Mr. Logan valued this at $140,000 he being familiar with New York conditions, shake your confidence in your estimate of only $75,000 for those four holders?

A. Not a bit.

Q. Well, let us take the next holder, 2,000,000 cubic feet capacity. Mr. Logan's valuation was $120,000 and yours is only $84,000, new. Would you make that same reply as to your judgment in that regard?

5345 A. Yes, I say constantly that I am a buyer in this case instead of a seller, and it makes a difference.

Q. But there has to be a seller wherever there is a buyer, and the price is the same whichever side you look at it, isn't it?

A. You have to come to the same price to get a trade, I guess.

Mr. Mathewson: We find it so in our business, at any rate.

The Witness: I do not think Mr. Logan would be much of a seller at those prices.

Q. You know the Logan Iron Works has a pretty large business in such things?

A. No; on the contrary, I have seen mighty few of his holders. I see holders of every other make. The only holders I have seen of Logan's are right down here among these works. I have been pretty well over the country with regard to holders, and I see thirty of other makers to one of Logan's, certainly.

Q. Have you bought holders set at the prices you have given anywhere in the country within the last ten years, of that capacity?

A. Less than that. I say this price is twenty-five per cent. or thirty per cent. greater than the bids I have right in my pocket.

Q. Where? Where have you bought one in the last ten years of this capacity, and weight?

A. I don't say that capacity. As the capacity gets greater the price gets less.

Q. Well, I am trying to deal with this particular holder?

A. I have not bought a holder of that capacity in the last ten years; no, sir.

Q. How about the holders of Bartlett, Hayward & Company, or Mr. Mayer? You have seen those in a great many places, haven't you?

A. Yes, and bought them just as cheap as I am talking about.

5346 Q. They don't seem to have much difficulty in selling them, as far as your observation goes, in other places? You see lots of them?

A. Yes, you see plenty of their holders; indeed you do.

Q. Now, again, on the 21st Street plant, four holders, valued at $182,000 by Mr. Logan, valued by you at only $115,000, while the valuation of Mr. Mayer is $219,400, or just about twice your figure. You heard the testimony, or read it, given by Mr. Mayer, didn't you, as to that being a fair value?

A. On 21st Street, four holders?

Q. Yes.

~~A. Yes,~~ I took his own figure of weight.

Q. In view of his ~~experience~~ and the holders you have seen about the country, you are still prepared to say that those particular holders, of that weight, could be installed to-day for half his price, or $115,700?

A. Yes, less than that.

Q. How many pounds did you assume there were in the total construction of those four holders, including the shell, guide frames and connections?

A. That holder threw 8.91 inches.

Q. And Mr. Mayer's pressure was only 8.70. You found a little higher pressure in that case, didn't you?

A. Yes.

Q. And how much did you compute the weight of the holder to be?

A. 282,000 pounds at 6.6 cents.

Q. How much for the guide frame?

A. 164,700 pounds.

Q. A guide frame for 164,700?

A. Yes, sir.

Q. How many columns? Aren't there sixteen cast-iron columns?

A. Yes, sixteen, I think. That is right, I counted those.

Q. Are those cast iron?

A. No, those are, I think, steel. No, cast iron, cast-iron columns.

Q. Do you mean to say that in your judgment the weight of the guide frames and columns was only 164,700 pounds for each holder?

A. Yes.

Q. As it stands there?

A. Yes.

5347 Q. Did you measure those guide frames and compute their value?

A. I did.

Q. And computed their weight?

A. Yes, sir.

Q. Now, let us have the details of that computation?

A. — haven't anything more here than 164,700 at four cents; cast-iron girders 16,150 pounds, and guide rails 960 pounds.

Q. Cannot you give us the dimensions from which you computed a weight of only 164,700 pounds for each guide frame, including columns?

A. No, I have not carried that out on the memorandum of this cal*uc*lation. I notice it amounts to more than one-third of the cost of the shell. However, that is considered an ample allowance for guide frames.

Q. How thick did you figure the cast iron in the columns?

A. I think it was an inch thick.

Q. Well, are you sure about it?

A. That is what I allowed for cast iron, unless I found—there were some of those columns that looked like cast iron, which, when I saw a hole bored in them I found to be steel.

Q. What did you find to be the diameter and height of these columns?

A. In this computation here I have not carried that out. I have not got it down on the pages as a resumé of my calculations. It shows the weight of each part, the cost of each part and the total cost of the holders and inlets and outlets. I think that perhaps an inlet and outlet I carried out, four of them which we examined. I see it is four cents here, a pound.

Q. Did you include any iron work for the brick tank?

A. Yes, that is included.

Q. What weight for that and what price?

A. It is not put down here separate.

Q. Now, will you look at the apparatus under 99th Street station
for a moment. We have four sets of ten feet U. G. I. Lowe
5348 water gas apparatus, which Mr. Mayer valued, including the
floor, at $64,167. I find that you value those at $45,200, and
I find a note underneath as follows: "The water gas apparatus (Mayer 1539) is valued at $56,000, and $8,167 for the charging floor. The apparatus was installed in 1904 and price was obtained from the U. G. I. Imp. Co." What does that mean?

A. United Gas & Improvement Company.

Q. What is the meaning of that note? Explain will you a little more fully what you mean by that?

A. I took it out of the description of Logan.

Q. What descr*pi*tion?

Mr. Kirby: That was included there so as to tally up with the building.

Q. Then you do not mean that you obtained your price and value of $45,200 from the U. G. I. Company?

A. No, sir.

Q. The note, following your figure, I thought it might have referred to this?

A. No, it was Mr. Mayer's, I think.

Q. Now, near the end of the apparatus schedule of the 99th Street station under "retort house" I find "eleven through benches of sixes, back to back, cost new blank dollars, depreciation blank per cent., value blank dollars." I find nothing carried down either in the columns of "original cost" or of "present value, less depreciation"?

A. That is an omission. I noticed that last night but I had not the data right at hand to supply that. That is an omission, sir.

Q. Well, for the purposes of completing the schedule is it fair to insert Mr. Mayer's valuation in that case, as you have in many of the others, or do you wish to fix a value differing from his?

A. 99th Street, I should like to put in my own value on that. I don't know how it came to be omitted. I have some corrections to make on these on deductions and additions and I would like to put in the value of those benches. 5349

Q. Can you supply that now?

A. I can.

Q. Very good, I should be glad to have you do it and we can fill it in and the record will be complete.

A. (The witness computing.) $39,900.

Q. For eleven benches?

A. For eleven benches and eleven empty arches.

Q. New?

A. New.

Q. Did you observe Mr. Mayer's addenda, Item 1, that instead of eleven there were twenty benches?

A. Yes, I say, I added eleven arches together with the iron work for eleven——

Q. That will be $39,900?

A. They are just the same practically as 44th Street. $39,900.

Q. That is ten per cent. you allowed there, wasn't it, for depreciation?

A. The depreciation on benches in cases is based on depreciation of one-third of the $150 for retorts and setting as applied to the holder and it amounts to 6½ per cent. on going apparatus.

Q. Well, what would you say as to this? I merely wish you to fill the records by saying what depreciation you apply to this?

A. 6½ per cent.

Q. And that would give a net figure of how much?

A. $37,307.

Q. Now, did you take into account there Mr. Edgerton, that the material was all on hand to set those eleven empty arches, absolutely new material, and merely required the setting, in making your estimate?

A. No, sir, I noticed that in one other case, that was at 42d Street, and there had not been anything done there toward doing the setting, and I thought if they had done it up to that time they were possibly reconsidering it.

Q. So you made no allowance in those cases?

5350 A. No, sir; I saw it was not done, and if they had the material when Mr. Mayer was there it was still there, and what material I saw piled up in the empty arches has not anything to do with that setting at all.

Q. You mean it had not?

A. At 42d Street.

Q. You do not mean not at 99th Street?

A. No, I don't remember that.

Q. Now let us look at 18th Street station for a minute. The first item in apparatus, "two vertical boilers"; you have said, "value nothing"; you have allowed no value either new or as depreciated in that case, have you?

A. No, I did not. I agree with Mr. Mayer on that.

Q. Did he allow any value for it?

A. No, it was burned out, scrap.

Q. Let us take the 18th Street connections. Mr. Mayer, computing from the schedule of connections, including length and sizes, finds a value of $21,987 for the 18th Street connections; and is it a fact that your estimate is only $2,800, about ten per cent. of his?

A. Yes, that is a peculiar case. There was no output at the station to base any calculation on, based on output, and as it was out of use and no output to base connections on, the retort house dismantled, and everything gone to scrap, I just "scrapped" it.

Q. Well, you know the company sends in about three million feet a day there, don't you—or didn't you know that?

A. I think $2,800 would cover what it would require to send into the gas holders, yes, sir.

Q. So you didn't there place a value on the basis of cost of reproduction, at all, did you?

A. No, I did not in regard to connections.

Q. Assuming that Mr. Mayer's figures as to dimensions and descriptions of connections in these various others was correct and you were to compute the cost of installing them new as they 5351 are now without regard to whether they would all be necessary if the plant were to be now constructed, you would not calculate, would you, this estimate of the cost new, in those connections?

A. I think I might differ a little. I think on those holder stations, where they are new, there is some difference, where I computed them.

Q. There would not be a large difference without depreciation and assuming they would all be reproduced as they exist to-day?

A. It should not be large, and I took the prices of valves, the New York prices, and prices of pipe, and computed——

Q. Do you know whether it is steel riveted pipe in these new stations?

A. No, I do not. I computed on the basis of cast iron pipe.

Q. And not steel riveted?

A. I saw riveted pipe for blowers.

Q. Steel riveted pipe would be more expensive, wouldn't it?

A. Yes, I think it would, although not much. That cast iron pipe would be a great deal heavier, but you could take advantage of that making the lighter pipe with steel.

Q. Do you know the price of pipe to-day per ton?

A. I have not priced any to-day, no, sir.

Q. Well, within the last few days?

A. I think it is a little higher than——

Q. About $32 a ton, isn't it, now?

A. Something like that.

Q. Now, here again at the 63rd Street station I find Mr. Logan's value of holder is $160,000—the three million foot holder—and yours is only $129,320. Is there any explanation of that except your different estimate of weight of material or unit value?

A. I have Mr. Mayer's unit of value, I think, on that, and I weighed the holder. I do not see where we could differ.

5352 Q. Well, Mr. Mayer's value is $160,374, and Mr. Logan's is $160,000 exactly?

A. That is the 63rd Street holder?

Q. Yes.

A. I make it only $129,320.

Q. Can you explain the discrepancy there, if you took Mr. Mayer's unit price?

A. Well, that is the holder where I valued the guide frame away up.

Q. What did you value the guide frame at there?

A. $48,000.

Q. What weight did you assume the guide frame to be?

A. There are twenty-four Phœnix columns, I think, there.

Q. One hundred and twenty-two feet high?

A. Yes, 41,000 pounds at five cents.

Q. You do not mean only 41,000?

A. For each panel—each bay, they call them; there would be twenty-four of them at that.

Q. That would be how much for weight of the guide frames then on there?

A. Twenty-four times forty-one.

Q. That would be 984,000?

A. Yes.

Q. What did you compute the weight of the holder to be, the shell?

A. I guess I must have got that pretty close. The shell was 1,209,271 pounds.

Q. Does not a guide frame of that character cost more than other guide frames, aside from the weight?

A. Yes, it is more than half the cost.

Q. Was it double or single bracing, if you noticed?

A. Oh, it was braced tight throughout. I can show you how it looked. It was braced like that (exhibiting a photograph).

Q. Well, would you call that double or single bracing?

A. I would call that sextuple.

Q. Did you allow for all that bracing in your estimate?

A. I tried to.

Q. Did you know that that——

A. (Interrupting:) Those diagonals are a double band there, so that would make it double sextuple (indicating on the photograph).

5353 Q. You allowed for such?

A. Yes, that has been allowed for.

Q. And you think the weight you have given for the guide frame will allow for and cover all that bracing?

A. Yes, I think so. The photograph was taken as a memorandum to be sure to get things in.

Q. Taken by you in other instances also?

A. Yes.

Q. Did you take into account, Mr. Edgerton, that the 63rd Street holder was placed in solid rock, where it had to be, where rock had to be taken out?

A. That is the cheapest kind of holder to build—a tank.

Q. Did you know that fact or take it into consideration, whatever effect it may have?

A. I did. The gas holder tank is calculated out somewhere in the calculation. By the way, I notice they make that seven foot thick at the bottom, I suppose with the idea of holding the rock up. Five feet is ample.

Q. That may be what that sextuple bracing is put in for, to keep the rock up, to do a thorough job while we are about it?

A. Well, it is a fine thing if you can pay for it.

Q. Mr. Edgerton, the two holders at the 65th Street station, which Mr. Logan valued at $52,000 and Mr. Mayer at $57,000, I see you value at only $32,000, and the same about the four holders at that station which Mr. Logan valued at $104,000 and Mr. Mayer valued at $140,000, and you valued them at only $65,600 or a fraction in each case. Did you go over those holders also and get your estimate of weight?

A. No, those are calculated by the cubic contents. Not having the weight, I based those on the cost per thousand cubic feet for holders of that——

Q. What did you estimate that those holders would throw in pressure?

A. Well, I say I did not estimate on that, that the price we allowed them to throw a good pressure.

5354 Q. Well, what weight?

A. In the bid which I have they could on a two lift holder——

Q. No matter about that, I don't care anything about the bids you have. I want to know what pressure you consider those holders throw?

A. They should throw 5.6; along there somewhere.

Q. That is your supposition, that they do about that, is it?

Mr. Kirby: You have reference to the two small holders?

Mr. Mathewson: The two and the four holders; not the four million foot holders.

A. For the price I have estimated in there they would throw a pressure of 5½ inches; 5.6.

Q. And at the same unit price for material which you have suggested previously?

A. No, I think that would be somewhat lower, because it is a lower scale bid or figure.

Q. Such as what?

A. It would be a pretty low figure. I do not think it would come over—it would not come over five cents probably.

Q. For everything, including the shell, the frame and the connections?

A. Including the shell and the frame. This is a brick tank.

Q. But there are pipe connections, aren't there?

A. Yes, inlet and outlet, that is always included.

Q. Did you figure on wrought iron or cast iron columns?

A. This is on wrought iron, modern holder.

Q. Now, the two holders following at this plant, 14,000,000 capacity, Mr. Logan values at $400,000 to reproduce and Mr. Mayer at $398,645, substantially similar figures, and your figure is $294,000, or over $100,000 less. Can you explain such a great discrepancy as that?

A. Well, there is the weight of the holder, the shell at Mr.
5355 Mayer's price, 1,078,000 pounds at 6.6 cents and the guide
frame is the same as that Phœnix guide frame $48,000.

Q. Well, let us take the shell in the first place; what is the weight of shell do you understand?

A. 1,478,000 pounds.

Q. Well, that is evidently a clerical error, because that is not the weight Mr. Mayer testified to?

A. Well, he may have included the guide frame.

Q. No, shell alone. Well, we will have to get this thing to agree. What did you figure as the weight of the guide frame in the case of the two big holders?

A. Well, this is one of them, got about the same guide frame——

Q. Well, what weight would you say?

A. Well, that would be like that other one we figured.

Q. Something over 900,000 pounds?

A. What I figured before.

Q. That was 984,000 pounds?

A. Yes.

Q. What weight would you figure for the pipe connections, for those holders each?

A. 62,000 pounds.

Q. Are you aware, or does it appear, that that weight is only one-half the weight which Mr. Mayer found for the pipe connections, or haven't you that in mind?

A. I think he said that there were two sets of connections there. I never heard of two sets.

Q. You figured on only one set?

A. I didn't figure on two inlets and two outlets anywhere.

Q. So if there are two sets of connections of course his weight would be higher than you considered if you were reproducing the holder and connection as it now is?

A. Yes, if I were putting in two sets of connections in a gas holder, I would expect to have them double one set.

Q. Is this not a steel plate guide frame of a different character, instead of Phoenix columns and a different value from the previous frame?

A. Well, there was one Phoenix column and the other of
5356 substantially the same character. I didn't see any particular
difference, I took the photograph of that also, but I haven't
it here.

Q. You know this is a patented construction known as "ribbon plate" construction, don't you? Isn't that the description of that guide frame?

A. There is a patent on pretty nearly everything new and I didn't know they had a patent on a guide frame, except those where they did it without——

Q. No, on the holder plating, I didn't mean to say the guide frame, if I did—"ribbon plating," and isn't "ribbon plating" much more expensive?

A. You mean to put ribbons in between——

Q. No, don't you know what "ribbon-plating" is?

A. No, I do not.

Q. On a holder?

A. No.

Q. And don't you know it is much more expensive and is considered better than the ordinary construction?

A. I don't know of it being better. We have had holders tight for a good many years, and that is all we want of them.

Q. Well, where the sheets extend in one length from leg to leg. Aren't you familiar with that construction?

A. From upright to upright, you mean?

Q. Yes; are you familiar with that construction?

A. Well, that is a pretty good fancy, I don't know as it is any better, no, I am not acquainted with it.

Q. You are not familiar with the cost of that particular construction?

A. No, sir. I didn't know it was any different, I thought it was the regular construction.

Q. Where have you ever bought yourself, or been in charge of, a four or five million foot holder?

A. I never had charge of a four or five million foot holder.

Q. Did you assume the same figures for values of material in the
case of these four million foot holders which we are
5357 & 5358 now considering, which you assumed in the case of the
other holders?

A. I think where Mr. Mayer stated 7.1 cent- I multiplied it by 7.1 cents instead of 6.6 cents.

Q. Well, that was the case with these two holders, wasn't it?

A. I don't know which holder that was. I think it was the 132d Street holder.

Q. Then, if you and Mr. Mayer differ in regard to the value of a holder, or you differ with Mr. Mayer and Mr. Logan, because they are practically the same, it must be on account of the different weight of material which each assumes, must it not?

A. Yes; that's it. We do not disagree as much as is supposed.

The WITNESS: I find, Mr. Mathewson, that I have a photograph here showing those two different styles of framing, with a memorandum. I think this sextuple was rather the best style, and I should prefer it, without going into the details. It does not show it so clearly, but there are the two holders.

Q. The sextuple as opposed to the double sextuple, if you were to build?

A. Yes.

Q. The double sextuple would be more expensive to build, I suppose, wouldn't it?

A. I suppose so. It appears to be so.

Q. In other words, it has a greater amount of bracing material, of course, than the simple sextuple?

A. Yes, but as a matter of fact, holders are built now days without any of that at all; they go right up in the air without any bracing at all.

Q. Yes, and sometimes they fall down, don't they?

A. No, I don't think that that condemns it at all; I think that is done very commonly; none of that framing is on them.

Adjourned to 10:30 A. M., January 9, 1907.

5359 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant.
vs.
JULIUS M. MAYER, as Attorney General of the State of New York, WILLIAM TRAVERS JEROME, as District Attorney of New York County, FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and the City of New York, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *January* 9, 1907.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

5360 Mr. BURR: Mr. Mathewson has produced the two letters to which reference was made the other day by me, and which have already been marked for identification. I now offer them in evidence. I believe there is no objection to them.

Mr. MATHEWSON: I stated yesterday that, expecting similar courtesies, etc. I would not object.

The MASTER: They take their same numbers.

Papers received and marked City Exhibits Nos. 123 and 124.

HENRY H. EDGERTON resumed.

By Mr. MATHEWSON:

Q. Mr. Edgerton, you spoke yesterday of some bids that you had. I do not understand that you are now constructing any holders in the City of New York?

A. No, sir, but I——

Q. Wait a moment, do not answer anything but the question. And I do not understand that you have been employed to construct any holders here in New York City, have you?

A. No, sir.

Q. What method did you adopt in computing the values of the buildings in the different plants? In other words, did you get the cubic capacity of the buildings?

A. I calculated that in some cases, in order to ascertain what sort of a comparison that would make with the estimates of the buildings; but these buildings, as I computed them, were on the basis of the brick work, foundation and the actual material entering into the construction of the buildings.

Q. Was that so in all cases of buildings that you gave?

A. Yes, sir.

Q. How about the foundations, how did you know how deep they were?

5361 A. I did not absolutely know. I was taking the estimates or inventory of Mr. Mayer as a guide to the depth of the foundation. I supposed that he either had drawings or some more exact means of informing himself than I had. I want to say right here, though, that I introduced piling into quite a number of buildings that at present have no evidence of having been piled at all, or if they had been piled, that they have sunk and got out of shape in a way which would indicate that there was no piling. On making inquiries in regard to the buildings in the immediate vicinity I found buildings much higher—that is, three stories higher—that were not on piles, and standing better than the building on the opposite side of the street said to be on piles.

Q. Now, did you adopt Mr. Mayer's figures as to the depth of foundation and character of foundations, or his description so far as he gave it in reference to all the buildings?

A. Yes, sir, in reference to all the buildings and foundations.

Q. How about the foundations of apparatus, which he included in the value of buildings? How did you determine how much to include for that?

A. I included foundations for apparatus that had any foundations; I found in many cases there was said to be foundations for machines where there was no machine on the foundation, therefore I could not calculate the foundation under a machine for dipping and cleaning gas stoves, or for sewing up leathers, or some little, trifling matter as that. I suppose those foundations were in there at a time when the building was used for other purposes.

Q. Well, that does not quite answer the question. I asked you how you determined the amount to allow for foundations of apparatus?

A. By his description in all cases where there was anything on a foundation to need it. I say in those places where there was nothing on the foundation or requiring a foundation I did not
5362 calculate it, and there was no definite description by Mr. Mayer. It just said foundation for machinery.

Q. There were very few instances of this?

A. There were quite a good many in 21st Street, right straight through each range of buildings, foundation for machinery, and no machinery on the foundation.

Q. In some cases you did not find any machinery on the foundation, and in those cases you did not calculate anything for the expense of putting the foundation there originally?

A. No, sir.

Q. Take the foundations of the apparatus which you found in position. How did you determine the value of those foundations?

A. Small foundations are easily determined by the size and apparent weight of the machine.

Q. Did you measure the foundations as to depth, or test them in any way as to depth, or their character, except so far as they appeared on the surface, as you might say?

A. The foundation of an engine or a small machine or upright boiler, or something of that sort is of very little consequence.

Q. A good many of them might be of considerable consequence, and I am asking you whether you had any other information except what you saw with the eye?

A. And what we read from Mr. Mayer's description.

Q. Yes, and read from Mr. Mayer's description. And you refer to the schedule which Mr. Mayer furnished to you and Mr. Marks, through counsel for the company, I suppose?

A. Yes.

Mr. Kirby: And the testimony?

Mr. Mathewson: Well, no, I say when he refers to the schedule he refers to that.

Q. In referring to the schedule you mean the one Mr.
5363 Mayer furnished you through the counsel for the company, I suppose?

A. Yes.

Q. So that you did not pursue the method which Mr. Marks pursued in determining the cubic contents of the buildings, in computing your values?

A. I calculated the cubic contents merely out of curiosity, to see how it did compare with the calculation of actual quantities. I did not use it as a factor at all.

Q. Did you compute separately the slating and glazing work, and carpenter work, and the roofer's work, and the stone work, and stair work, the same as you did the brick work?

A. All those were accounted for. All the additions to the buildings of every description were accounted for.

Q. My question was whether you computed—you said in reference to the buildings and walls that you computed the brick work.

Now, I am asking you whether you separately estimated the slate work and other classes of work?

A. Certainly. Carpenter work; so far as the windows and openings are concerned, they are taken as equal to the brick work which they displaced.

Q. What about floors and stairs; did you compute those separately?

A. Floors are computed. So far as stairways are concerned, the allowance is undoubtedly made for them. I did not, except in the case of gasholder framing, and where the stairs are carried up as a matter of some consequence, I did not notice any stairways there that amounted to more than a very small fraction. That would be included in the——

Q. Well, whatever they were, did you compute each one of the separate items—of the individual items separately, such as carpenter work, so much, including material so much and labor so much; brick work so much, including bricks so many, and labor 5364 in laying, so much; slating, so much, including material so much, and labor so much?

A. Yes.

Q. Did you compute those all separately?

A. All separately. They all went in as a separate item.

Q. Won't you take a typical building, say the generator house at Twenty-first Street, which you valued new at $65,500, and with depreciation of fifteen per cent. off at $55,000, and give me the details of that figure. It is page 6 of the Twenty-first Street station.

A. I will say in regard to that generator house, the description given by Mr. Mayer was rather obscure, and it needed—this building had evidently been altered, the roof raised, quite a number of changes and additions made to it, and it is now supported on columns.

Q. That is since 1884, is it, you would think?

A. I think it was possibly done to accommodate the Lowe process generators.

Q. In other words, the building is now, so far as you can make out, distinctly different from what it was in 1884, is it not?

A. Yes.

Q. You found a very great amount of new foundation in that building, did you not, put in apparently within the last fifteen or twenty years?

A. Well, I am uncertain about that. There are no descriptions to give any idea of whether those generators were placed on foundations in part that were there before or whether they were special foundations built up for them.

Q. Of course the water gas apparatus requires a foundation under it and a substantial one, and it could not be operated efficiently without foundations under it?

A. No more substantial than the previous retort foundations, or stacks of any account.

Q. Well, don't you know that the water gas apparatus are not located on the same spots as were the previous retorts?

5365 A. There would be possibly a little difference. They would run over onto the space in front of the retorts to some extent, but then there would be plenty of foundation there for them. I was not able to determine that by any measurement of my own, and I do not see how anybody else could, unless they had plans.

Q. Let us have your detail for that house?

A. There is one building there 204 x 74.

Q. I am referring to that. You describe it as 204 x 74 x 30 feet?

A. By 30 feet; yes. There are 460,000 brick, 394 cubic yards of excavation, 18,000 pounds of cast iron columns, 150 steel girders at 2,960 pounds, 3,990 cubic feet of stone footings, 5,700 iron trusses and purlins, 113,960 pounds. And there is the roof factor, 16,606 square feet of slate roofing, 204 lineal feet of ventilators, 408 lineal feet of cast iron gutter; foundation for machinery, cubic contents, 204 x 74 x 30, 452,880 cubic feet; 11,620 feet of cast iron floor pieces, 204 x 74 x 22, 332,000 pounds. By the way, I think there is something due probably to come out of that; I think those generators and apparatus took up part of that space. Steel to carry the same, 204 x 74 x 5, 227,000 pounds. Then there are 48,502 columns, figured in the adjoining generator house. This generator house and the other standing contiguous have got columns there that form, as it were, a sort of a party wall, that is, it is to be divided between two; and I find the probability is Mr. Mayer may have thrown them into the generator house, or in some cases they may have been divided between the two houses.

Q. Did you put them into this generator house?

A. It is figured in the adjoining generator house.

Q. The columns are?

A. Yes, sir. Here is the situation there, Mr. Master, in regard to that (indicating). This is an old building of very large extent.
5366 If the roof has been raised to accommodate different machinery in the following changes that I have spoken about hitherto in changing processes from one process to another, it would involve that much of this building, and apparently that is where the roof was raised and these columns put in here from point to point. Now, those columns, I say, in this generator house are figured over in that one, in that case. Here are three roofs; th-y run in this shape here. There is one roof there and supported on those columns and in that shape. Here are the only walls, in front and back, and there are the columns. So there are two lines of columns running down completely through that building, and I was at a loss to know whether that was previously supported on brick walls, which it may possibly have been, or whether it was supported on columns. If it was merely supported on brick walls, those walls had to be torn down, and a good deal of throwing away of material, which may account for a considerable duplication of material in the construction of that building. That is not only from building up, but from tearing down the old building. I think very likely that all went into the cost of construction of that building.

Q. Well, you don't know whether it went into cost of construction or not, do you?

A. I don't see where it could go if it did not.

Q. Well, you don't know anything about that?

A. Well, I know what is always done in those cases.

Q. You don't know what has been done in this case, whether it has been charged to construction or charged up to depreciation, do you, as a matter of fact?

A. I have——

Q. Well, do you know?

A. I know a great deal about the way they kept their accounts.

5367 Q. Do you know whether this tearing down at 21st Street was charged to depreciation or not on the company's books?

A. Following the system that I saw on the company's books——

Q. Do you know in reference to this building we are talking about?

A. Not in this building, no, sir.

Q. Very well, let us not have any remarks made about it now. Now, this roof was raised and these changes were made when the Lowe apparatus was put in, within the last twenty years, apparently, were they not?

A. Yes. There have been three sets of machinery put in there.

Q. Was the roof of this building new?

A. It was apparently new, yes, sir; that is, I mean to say it did not look as old as some of the roofs.

Q. Did it not look like a new roof at that time?

A. It did. The trusses looked as if they were of recent construction. The other buildings, some of them, had that spiderweb construction that we used to adopt, and this was a little more modern type.

Q. Have you given all the detail of your figures?

A. For that particular building?

Q. Yes. Did you make this calculation, or did an assistant make it for you?

A. The calculations were originally made by Mr. Robert S. Woodward in the office while I was present there and with my assistance, and we checked over and consulted about the various prices, and he prompted me up on New York conditions, which seem to be so unfavorable.

Q. Will you let me see your sheet from which you are reading your detail a moment?

Mr. Kirby: That can go right in the testimony as it is, or I will have a copy prepared and furnish you.

Mr. Mathewson: Very good.

Q. Does this total up the $65,500 to which you have testified?

A. $65,500, including $10,000 for foundations.

5368 Q. What do you allow for carpenters per day, do you remember without referring to any sheet? I would like to have your recollection.

A. No, I have not. It is put down here as——

Q. No, not what it is put down at, but do you know what carpenters are paid in the City of New York of your own knowledge?

A. No, not of my own knowledge, they vary.

Q. Now, I will ask you what rate you reckoned on?

A. Sixty cents an hour.

Q. How many hours a day?

A. I don't know as it makes any difference if a man works—if his pay is based on the hour, whether he works eight hours or ten hours.

Q. Perhaps it may. How many hours a day do you compute?

A. Well, the price set by the hour does not make, as I say, any difference. I suppose eight or ten hours a day.

Q. What would you assume that meant per day for a carpenter?

A. That would be $4.80 for eight hours.

Q. How much for slaters?

A. Slate roofing is calculated on the basis of thirty cents per square foot.

Q. But how much per day for slaters?

A. I have no memorandum.

Q. How much for slaters' helpers per day?

A. In regard to the slate, I say it is computed on the square foot, at about fifty per cent. greater than I have had it done for.

Q. You say you have never had any of this done in the City of New York?

A. No.

Q. Now we are talking about New York. How much per foot did you allow for slate roof?

A. Thirty cents.

Q. How much of that was labor and how much slate?

A. The slate would be worth probably from 8 to 14 cents per square foot, according to the quality of it.

5369 Q. How much did you allow here out of the 30 cents for the slate?

A. About ten cents.

Q. And about twenty cents for labor?

A. That would be the difference.

Q. How much do you allow for plumbers per day?

A. Well, as far as the plumbing is concerned, I do not see that it enters in there. There are pipe fitters; it would be 45 cents an hour, and helpers 30 cents.

Q. And how much for painters?

A. Well, as regards painters, a coat of paint is always provided to be put in there when you send the iron work. This is a question of iron-work. I do not suppose there is any extra charge. I have not made any extra charge for iron-work which has been already painted.

Q. Well, you found woodwork painted and various things painted. How much would you allow for a painter per day, or did you not allow anything for painting?

A. I did not see any woodwork painted in there.

Q. Then you allowed nothing for painting in the plants?

A. I will not say plants. I say there, it is all iron-work and steel-work that has been painted.

Q. I am not talking only about this building, but about all the buildings of the various plants. What did you allow for painting; what did you allow for a painter's wages per day? You certainly found painting in some of the plants?

A. Well, a gas plant, no, as far as that is concerned, except perhaps an office building or something of that sort. There is very little painting to be done.

Q. Don't you know, Mr. Edgerton, that as a matter of fact all the steel-work and iron-work is painted after it is put in position, and frequently two coats of paint?

A. Yes. Well, that is put on by—if that is provided, it is put on by the contractor. The erection of a gas holder, unless it has
5370 special terms, or if it is put on by the company, it goes into their ordinary working expenses.

Q. How much do you allow per day for a painter?

A. I have not any allowance for a painter there.

Q. How much for a mason per day?

A. Same rate as the bricklayers, 70 cents an hour.

Q. That would be how much per day, $5.60 for eight hours?

A. Yes, $5.60.

Q. And how much did you allow for an ordinary laborer, I mean a laborer in building construction work?

A. Twenty cents an hour.

Q. That would be $2.40 a day?

A. Twelve hours, yes, if you get them that long.

Q. That would be $1.60 a day for eight hours?

A. Yes, and ten hours would be $2.

Q. How many bricks did you estimate one mason would lay on the average in a day?

A. He would lay about one thousand bricks a day, I suppose, on the average. They can lay a great deal more, but then——

Q. How many laborers did you assume would be required for, say, four masons?

A. Now, as a matter of fact, we know how much that work cost complete per thousand when we know the price of brick and price of labor, and, therefore, at $20 or $21 per thousand, it includes laying and mason work and lime and sand.

Q. You don't know that when you know the price of brick and the price of labor, unless you know how many laborers you have got to have and what their wages are, and I ask you, for instance, what proportion of helpers or laborers you require as compared with the number of masons to keep the masons employed?

A. That is the mason contractor's business.

Q. To establish that $20 or $21 a thousand?

A. Well, that is the price that I have found some of the very most efficient contractors in town offer to do that kind of work for.

5371 Mr. **Mathewson**: I move to strike that out as not responsive and not proper testimony.

The **Master**: Strike it out.

Q. Now, I would like to have you, if you can, give me the details of $21.00 per thousand for brick laid, showing how much is material and how much is labor, and how that labor is divided between masons and masons' laborers?

A. Well, that ordinary brick was $7.50 and the difference between that and $21.00 is labor and mortar and lime.

Q. I know, but I would like to have you divide it up. Can you do it?

A. No, I do not believe anybody else can except a contractor.

Q. Well, you cannot, that is the point. Do not testify for somebody else.

A. No.

Q. How many masons would you consider there should be for each foreman required?

A. Well, now that is a matter that I did not go into at all, in connection with this construction. It is not necessary. It is simply superfluous and is just talk.

Q. Did you make any allowance for time keeping on the job?

A. I made an ample allowance for inspectors.

Q. How much did you allow out of this $21.00 for time keeping on the job?

A. I allowed as shown in the exhibit there and shown in the inventory and appraisal, I allowed some $300,000, I think it was, for inspection and various overlooking of the plans.

Q. That includes, then, the keeping of time on the job and the superintendence, does it?

A. Yes, plenty of it.

Q. What did you allow as the value of Portland cement?

A. $1.75 a barrel. That is rather an excessive allowance unless they have to cart it to the place, but these works are built right along the dock front.

5372 Q. How much per thousand brick?

A. I say, as to the cement and sand required, we have the mixture in building the various parts requiring cement, such as tanks, and it is included in the cost of brick work at so much per thousand brick. I have not pretended to separate that off. Some use more and some less. It provides for grouting the brick work as it goes up, and for the sufficient use of cement for the different classes of work.

Q. What mixture of cement and sand did you include in this $21.00? What proportion?

A. Well, sometimes it is one to one and sometimes one to two.

Q. Yes, but so far as you were concerned in reaching your $21.00 a thousand, what did you allow?

A. One of cement and two of sand is the ordinary proportion, unless a man——

Q. Was that what you allowed in getting the $21.00?

A. $21.00 a thousand, yes.

Q. One of cement and two of sand?

A. Yes. In some cases one of cement and one of sand, it depends upon where it is located in the tank.

Q. How about this building that we have been discussing, at Twenty-first Street, the generator house?

A. Except in the foundation, that was not used——

Q. Just tell me how much there was, what proportion there of cement to sand you employed for the work?

A. It is built with mortar; we do not employ any sand above the ground level or any cement, except in extraordinary cases. Some engineers want all cement put in a building and others——

Q. You did not allow any cement above the foundation, is that right?

A. No.

Q. And in the foundation, or wherever you did use cement, you allowed one part of cement and two of sand.

A. Yes.

5373 Q. Was that not the proportion you allowed in substantially all the buildings you examined, or foundations?

A. That is an excessive allowance——

Q. That is not the question. Won't you be good enough to answer the question. In your figures you have given here, is not that the proportion, one of cement to two of sand, that you allowed in the foundations of substantially all of the buildings?

A. I tried to tell you that I did not proportion cement at all, except in extra cases of tanks. If you will let me tell you how to draw out and specify for different kinds of work, that is a different point. I estimated right straight ahead, based on a thousand of brick work complete.

Q. Twenty-one dollars?

A. Yes, sir.

Q. Without goin*ing* into the details of figuring out the amount of cement and the amount of sand, or the proportion, is that right?

A. We do that——

Q. Is that right?

A. Yes.

Q. And did you allow any cement in any of the buildings for the foundations, or did you consider mortar as used in every case?

A. Mortar is generally used——

Q. That is not the point, what is generally used. I am asking now what you contemplated or used in your estimates of values which you have given here?

A. I provide just simply for mortar.

Q. Now, in reference to the apparatus at these various stations, did you compute the weight of the apparatus and the various items of apparatus and compute the full value of them, based on the weight multiplied by a certain number of cents per pound?

A. Yes.

Q. In every case?

A. Not in every case. In the case of a purifier box, if it differed slightly only in size and depth, I computed it according to the ones that I had computed in detail. That is, say a box is 20 x 22 and another box is 22 x 22, the alteration was merely made in the 5374 bottom, or the extra amount added on that that would require for that amount of iron at the rate in which I found it in each case.

Q. But, as a matter of fact, when you got back to the bottom, that also was computed on an assumed weight, multiplied by a cost per pound of that weight?

A. Yes.

Q. Now, what classes of apparatus, if you will state, did you compute in that way, according to that method?

A. All I computed were computed by weights and by units of material.

Q. But what classes of apparatus, did you compute?

A. All I computed, that is, every one of them, I don't know what classes, every class; that is, the generators and superheaters and carburretors and purifiers and all the framing that I computed; it was all computed by weight except in those instances where I told you I could not get at the weight.

Q. And those which were not computed by weight included the rest of the apparatus, such as engines and pumps and so forth?

A. Engines and pumps were computed as a unit for the price of an engine and allowing for setting up; of course, I did not compute the parts of an engine nor the weight of a cylinder or piston rod. I took it as a complete thing.

Q. So I understood. And you think you have named the general classes of apparatus for which you did compute a value by taking what you assumed to be the weight and the value per pound of material?

A. Yes. I did not assume the weight, I calculated it.

Q. Yes, what you took to be the weight, put it that way?

A. Yes.

Q. Do I understand that you measured every single piece of apparatus in all these plants at the time of your disposal for this recent examination?

A. I checked off in a number of cases Mr. Mayer's measurements, and in a number of others I took it where I had not any reason to doubt it. 5375

Q. Will you give me the details of the value of the building in 132d Street, the exhauster and engine house respecting which Mr. Marks testified, and which he said he took as a unit from which he estimated other buildings?

Mr. Kirby: Do you mean the brick building 100 x 49 x 29? Because it is called in the testimony governor and boiler house.

The Witness: That is the only house there. There is nothing else there. It has got to be it.

Q. It is described in the testimony or in the schedule as governor and boiler house, 100 x 49 feet by an average of 29 feet high. You gave the value at $21,000, and I would like you to give me the details of that and your method of computing it in such detail as you employed.

A. Excavation, 53,900 cubic feet, 2,000 cubic yards. Boiler——

Q. At what price?

A. At 50 cents. That is shallow excavation. Boiler room, 700 cubic yards and fittings—743 cubic yards at fifty cents. Concrete footings, 990 cubic feet; intermediate boiler and exhauster room, 90 cubic feet; boiler and exhauster room footings, 300 cubic feet; floor exhauster room, 20 x 30 equal 600 cubic feet, 1,680 cubic feet. The floor of the exhauster room is concrete, it is 20 x 30 feet. There is common brick of foundation wall, 5,529; intermediate of walls, 420; main walls, 9,536; pilasters, 44; corbels, 249; intermediate walls, 1,372; gables, 500. Total, 17,650 feet; less openings, 16,150. Then there is some glazed brick, 100, 25—approximately 4,000 glazed brick at $25. Paving brick, 4,000 at $10. Fireproof concrete arches, area on the main floor, 4,900 square feet, at fifty cents. Cement floor in the exhauster room, 5376 20 x 30, 600 square feet; main floor, 2,800 square feet. Total, 3,400 square feet. Glazed coping, 298 lineal feet; bluestone window sills, 9 x 6 x 1, 130 feet; water table, 260 cubic feet, at fifty cents.

Q. When you say 9 x 6 x 1, what do you mean by 1? One what?

A. Nine feet by—— I don't quite understand that. I suppose it was in feet, 9 feet by 6 inches by 1 foot, I suppose. The lintels the same. Two hundred and sixty cubic feet water table. Exhauster room checker plate floor, 50 tons. Wall plates, cast iron and miscellaneous anchors, trusses and perlins, 14 tons, 64 tons, making 128,000 pounds at five cents. Windows and doors: Window area, 700 square feet, at 25 cents; fireproof doors, 2 x 2-6 x 7-6 steel. Steel stairs: One outside stairs, 30 running feet; inside stairs, 40 running feet; outside platform, 300 running feet; square feet, I suppose that means, 140 feet. Sheet metal monitors, 7 feet high, area 13 x 94, 1,200 square feet. Roofing: Skylight, 300 square feet; flashing copper, 298 x 12 x 1 (that is 12 inches), 298 square feet; 298 square feet gutters; main roof, tar and felt, 3,700 square feet at 6 cents. Slate 10 cents, 3,700 square feet. Terra cotta tiling, main roof tiled, 3,700 square feet. Painting and incidentals there is 10 per cent., that is a summary. The building is $22,000; with the foundation, $22,700.

Q. With the foundations $22,700?

A. Yes; with the foundations $22,700.

Q. What about your foundations for machinery?

A. Well, here is machinery foundations: One, 10 x 20 x 5, 1,000 cubic feet; one 10 x 10 x 5, 500 cubic feet, and one 10 x 15 x 5, 750 cubic feet; 2,250 feet altogether.

Q. That would make how much all told?

A. $700 for those foundations.

Q. $700 for those foundations. I thought you said $2,250 for the foundations?

5377 Mr. Kirby: That was the number of cubic feet.

The Witness: Yes, that was other foundations. This is 100 cubic yards at $7.

Q. What is?

A. $7 a cubic yard for foundation work is $700.

Q. That makes how much, that is the foundation work of buildings or machinery?

A. For machinery.

Q. That makes $22,700, you say?

A. There is a deduction here; $22,700 it is figured in one place.

Q. Your schedule appears to have a value now of only $21,000 instead of $22,700?

A. It is put down here at $22,700, and I say from some reduction or other it is made $21,000 in another place or $21,100.

Q. What was that reduction?

A. I guess I can trace it out there.

Q. Are those detail sheets that you are puzzling over in your handwriting?

A. No, this is not all my handwriting. Some of the calculations were made by other people. I did not pretend to make it all, but I checked it off; but there is a difference frequently occurs in a multitude of figures.

Q. Yes?

A. Well, you have them there in your own summaries, where they have been added and subtracted in a hundred places.

Q. Yes, but I am asking you now for the detail and how you get $21,000 in the schedule if $22,700 is on the detail, what that reduction represents?

A. That summary undoubtedly is not based on—it is an offhand summary. As far as the detail goes, we have here summing up to $21,100, and that is what it was put at. It is possible that I read off there, blocked out as the summary was, an offhand estimate made before the thing was completed, but according to detail here it foots up $21,100.

Q. Now, let us have that detail.

A. And 10 per cent.——

5378 Q. Let us have the detail?

A. It figures up $18,600 for material; then there is $1,860 added to that, making $20,460.

Q. For what?

A. Ten per cent.

Q. That is 10 per cent. of $18,600?

A. Ten per cent. is $1,860 on $18,600. That makes $20,460.

Q. What does that 10 per cent. cover, what is it intended to cover or represent?

A. Ten per cent. is a very usual figure to add on to an estimate to cover contingencies and engineering and unfor-seen or possibly omitted things. It is not an unusual figure to add to an engineering estimate of this kind to wind up.

Q. What about the contractor's profit, how much profit did you allow the contractor there on that cost of labor and material which would install a building?

A. Labor and material amounting to $18,600.

Q. And 10 per cent., $1,860?

A. Well, 10 per cent. would cover—there is less there in that after material summed up in the manner I have described a sum of $2,500.

Q. Eighteen hundred and sixty dollars of that would be the 10 per cent. and the difference between that and $2,500, or $540, would represent the contractor's profit?

A. No, when contractor takes brick work at $21.00 a thousand he has figured it in that he can do it and have a little money left himself.

Q. In other words, you have not figured any contractor's profits there separately, unless and except as it may be included in the value of the material which you have specified as $18,600, is that right?

A. There are some 15 per cent. added there which would cover not only contingencies, but any——

Q. I know—but you have said that 10 per cent. was $1,860, and that was added as an extra thing. Now that leaves $540 of the $2,500 that you mention, but you say that would not represent the
5379 contractor's profits because the contractor's profits would be included in the $18,600 value of material placed.

A. Some part of that is contractor's work that you can take finished at that figure, and the other is included in the $1,860 and the further sum of $640.

Q. Five hundred and forty dollars?

A. Or $540.

Q. Now, won't you tell me in which of these items of material placed the contractor's profit is included? By the way, would 15 per cent. be fair for contractor's profit on the whole?

A. A contractor told me——

Q. No, not what they told you. I am asking you, would 15 per cent. be a fair contractor's profit?

A. You can get it done for a great deal less than that.

Q. Would 15 per cent. be a fair contractor's profit?

A. It might be for the Consolidated Gas Company.

Mr. Mathewson: I move to strike that out.

The Master: Strike it out.

Q. Would 15 per cent. be a fair contractor's profit?

A. I have answered his question, 15 per cent. is his own assumption of profit, and it is an excessive one, and I have tried to say that it is not fair.

Q. Very good, you could say no, and that would answer the question?

A. No.

Q. Two letters would answer the whole question. Now, won't you take those items which make up the $18,600. You have given me the schedule of the number of bricks and so forth, but you have not given the values making up the $18,600 in detail You said so many bricks and so much a thousand.

A. 2,743 cubic yards of excavation at fifty cents, $1,370.

Q. Now, the next item is what?

A. Concrete footings, $480. Common brick, $4,760. Glazed brick, $100.

5380 Q. What did you allow for glazed brick, $25?

A. Yes.

Q. Give the prices in each case for the material?

A. It is $25. I gave the prices in the other statements.

Q. No, you did not in most cases, you merely gave the amount.

A. Glazed brick at $25. Paving brick——

Q. How many thousand glazed brick?

A. 4,000; 4,000 paving brick at $10.

Q. How much all told for that, $40?

A. It would be $400; 4,900 square feet of fireproof concrete arches on main floor, 4,900 square feet at 50 cents would be $2,500 about. Cement floors, 3,400 square feet.

Q. At how much a foot?

A. At eight cents a foot.

Q. How much?

A. $520. Glazed coping, approximately, 298 lineal feet, that is $10. Blue stone window sills, $130; 260 cubic feet at 50 cents; steel, $6,400—64 tons at five cents a pound; windows, 700 square feet, at 25 cents, $175; fireproof door, $40; steel stairs, $165.

Q. Did you have any weight for those stairs in your memorandum or any further description than merely steel stairs?

A. Thirty running feet outside stairs, and 40 running feet of inside stairs, and 300 running feet outside platform.

Q. That would be $25 for the outside stairs, $40 for the inside stairs and $100 for the running platform.

A. No, $100 is the total cost of it you know. It is not $100 a foot.

Q. That is what I say?

A. $165 total.

Q. Yes.

A. Sheet metal monitors, 94 feet, at $5, $470. Copper flashing in gutters, 298 square feet, $200; main roof, tar and felt, 3,700 square feet, at 6 cents, $220; slate, 3,700 feet, at 10 cents, $370; terra cotta
tile, main roof, 3,700 square feet, 15 cents, $500; painting,
5381 $150. That totaled up $16,100, to which, adding the con-
crete arching, $2,500, makes $18,600.

Q. Now, about that concrete arching, what would the details of that $2,500 be?

A. That was 4,900 square feet.

Q. At 50 cents?

A. At 50 cents. I got that in, too.

Q. Then that does not go into your total of $16,100, but goes into your total of $18,600?

A. Yes.

Q. Then you add 10 per cent. to $18,600, which is $1,860, for engineering and so forth, and get $20,460?

A. That is correct, yes, $540, yes, that is added altogether, $2,400.

Mr. Kirby: No, not $2,400.

Q. What do you add to the $18,600 to get your total on that memorandum, your final total?

A. I say I add $2,400.

Q. Well, what does that $2,400 represent?

A. It represents $1,860, the 10 per cent. and the $540.

Q. And taking the $1,860 which is the 10 per cent., what does the additional $540 represent which makes up your total of $21,000?

A. It is that $700 included in here.

Q. But if you add your machinery foundations, which you say are $700, to your $20,460, that makes $21,160, does it not?

A. Yes.

Q. Is that what it should be, $21,160, instead of $21,000, as your schedule states it, or what is the explanation. I am not trying to catch you, but merely to find out.

A. In a thing of this kind it is not like a man scrambling for a penny on the floor, it is a round figure of as near as possible an estimate of the cost of that thing. We do not treat with two or three or five or ten dollars. That $120 there, or $100——

Mr. KIRBY: $160, is it not?

The WITNESS: $160, it is dropped off there.

5382 Q. But as a matter of fact if you add your estimate of machinery foundations, which is $700, to your $20,460, it makes a total of $21,160?

A. Yes.

Q. Now your machinery foundations are figured out how? Give me that, if you will. One 10 x 20 x 5 equals 1,000 cubic feet; one 10 x 10 x 5 equals 500 cubic feet; one 10 x 15 x 5 equals 750 feet, or a toal of 2,250 cubic feet, which you have assumed to cost how much per cubic foot in reaching your $700 for the value?

A. 100 cubic yards, $7; there is an excessive allowance right there.

Q. Yes, 100 cubic yards at $7.

A. This 100 cubic yards would be 2,700 cubic feet. I guess you have got your $160 right there.

Q. I have not got any $160, you are the one that made these figures up. If you will let me take this just a second?

(Paper handed to counsel.)

Q. Then the difference between the $20.460 and the $21,000, or a little more, is made up, not by contractor's profits, but by $700 which you allowed for the cost of foundations for machinery, is it not?

A. Yes.

Q. Very good. Then do I understand that the contractor's profit of 15 per cent., or whatever per cent. is fair, the contractor's profit is included in the cost price as you have given it of each one of these previous items; that is to say, brick laid, painting and the rest, as you have given them?

A. No.

Q. Then have you got a contractor's profit still to add?

A. The contractor's profit is in that 10 per cent.——

Q. No, you said that was engineering and other expenses, that was frequently added for unfor-seen things.

A. And contingencies.

5383 Q. Now, you do not want to change that and put your contractor's profit into the 10 per cent. in addition to what you first stated?

A. Contractor's profits are divided there into some parts. I say a contractor offered to do that brickwork at even $20, $21 a thousand and he furnishes——

Q. I will ask you a question on which I think you can very easily answer, yes or no. You have given the value of excavation here at a certain figure, $1,370. Is the contractor's profit included in that $1,370?

A. Well, I think you can get a contractor to do it for that, yes.

Q. Well, is it included in the estimate here, in the $1,370?

A. Shallow—no, I don't know as a fair contractor's profit is included in that.

Q. Now, take the concrete, which you have figured at $480, do you mean to say that the contractor's profit is included in that $480? *A.* What rate is it at per cubic yard?

A. $7, I think.

Q. (Handing paper.) Don't you remember without looking it up?

A. I think it was $7, yes, I think he could do that.

Q. Did you mean to include a contractor's profit in the $480?

A. Yes.

Q. Take the common brick work, $4,760. Did you mean to include the contractor's profit in that?

A. I have had it offered to me for that.

Q. That is not the question, Mr. Edgerton. I shall have to ask the Master to ask you to answer the questions directly.

The Master: Yes, Mr. Edgerton, that is a proper request to make. I do not see why you cannot give your mind to these questions. I do not see why you should waste our time by sparring with the question.

The Witness: Well, I am not doing more than half the sparring.

5384 Q. Referring to common brick cost, which you have given as $4,760, is your contractor's profit included in that?

A. Yes.

Q. Take the glazed brick, is your contractor's profit included in that?

A. That is a small item.

Q. Well, is it?

A. No.

Q. Paving brick, is the contractor's profit included there?

A. No.

Q. Take the cement floors, $520?

A. I can shorten that up by saying that the contractor's profit, so far as my information goes, will be included only in that brick work, and we will say that concrete work. That would cover a reasonable profit. The balance of it and the smaller items would not, unless possibly the iron work there at the price stated.

Q. What profit do you include in those items for the contractors, what percentage of profit?

A. Five cents a pound for ironwork would include a contractor's profit.

Q. What perecentage of the contractor's profit on the price of labor and material to the contractor do you allow?

A. I think that ten per cent. would cover all that would be charged on that kind of work. Five cents for the ironwork would certainly cover it, for checker plate flooring.

Q. Five cents a pound?

A. Yes, sir.

Q. And you would say in percentage 10 per cent.?

A. The proportion would vary there, according to the size of the job.

Q. Did you in the other buildings employ the same unit figures as to value, cost and so forth, which you have given here in reference to this 132d Street building?

A. It would depend on the character of the building. That is a very superior building, compared with most of them.

Q. So that you took lower unit figures in the case of most of the other buildings, did you?

5385 A. Some of those buildings that were of the plainest description, and I used substantially the same unit for some parts. I would not use that floor plate unit there throughout, no. There is a difference in most of this construction throughout; they are in a different character of building, as you can readily see by looking over them.

Q. Well, you have the same details of the other buildings of the plants, haven't you?

A. The same size of brickwork and coping as applied to that building there at 132d Street would not be applicable to others because it is a superior character of building.

Q. Well, you have the details or some details as to these other buildings, have you not, throughout the plants?

A. Yes.

Mr. **Kirby**: I am quite willing, Mr. Mathewson, to offer in evidence the detailed estimates of all these buildings, or to have them marked for identification. They are all here.

The **Master**: Mark them for identification.

Mr. **Mathewson**: Yes, because there are a number that we may not touch at all. I may want to test his method in some building.

Mr. **Kirby**: They are all here, and I think that one who is familiar with the subject will be able to make out the method which is used and the unit value. There is a good deal on here which would need explanation; for instance, in this building where the summary of $22,000 led Mr. Edgerton astray in his first testimony, which, I think, he has straightened out.

Mr. **Mathewson**: I suggest they may be marked for identification and then I shall only have one or two questions to ask.

5386 Mr. **Kirby**: I will leave here this afternoon an envelope marked with each station, with the calculations of the buildings in it. There are a lot of other memoranda in these envelopes which I do not care to leave.

Mr. **Mathewson**: The original calculation?

Mr. **Kirby**: Yes, and we can have them marked for identification.

Q. Now, I call your attention for a moment to your summary of all the plants headed "Consolidated Gas Company value of all plants, January, 1907," showing a total of $9,367,344.25; that is after the deduction of the depreciation, as you have computed it?

A. Yes, sir.

Q. Now you have added to that, I see, for engineering superintendence and inspection only 3 per cent. Is that intended to include the entire allowance for general engineering, drawing plans, grading, paving, curbing, sewerage and drain pipes, temporary fences, operating tools and other utensils, water for holder tanks and apparatus required for operation of the plants, as well as miscellaneous extra expenses contingent and so forth, delays in construction due to strikes and one thing and another; is that 3 per cent. to cover all that contingent expense?

A. That does not cover the engineering inspection that the company furnishes.

Q. That is what I mean; all the company expenses in addition to the cost payable to the contractor for installing the apparatus and plants, whatever it is?

A. No.

Q. Let me ask you about this interest during construction at 4 per cent. You assumed that the plants as they now stand could be constructed within less than three years in ordinary course?

A. Two years.

Q. Well, then you take 4 per cent. instead of 5 per cent., assuming that the average would be one year at 4 per cent., do you?

A. Well, that is the time the average payments would become due.

5387 Q. In other words, you assumed a rate of 4 per cent. instead of 5 per cent. for money during construction?

A. Yes—no; I assumed 5 per cent. for the money, 5 per cent. interest on the money, but that it would not require all the money.

Q. No, but if it took two years to complete the plants, that would mean an average of about a year, would it not?

A. Well, a little less. I allowed a little less than a year for the use of the money.

Q. Well, will you tell me how you arrived at your 3 per cent. for engineering, superintendence and inspection, or, in other words, the expenses that the company is put to itself in connection with the plant?

A. I arrived at that when I was examining the books of the company by comparing with the Astoria plant. I saw that there was much less charged up in salaries to the engineering force for that plant than I had any idea was the case. I thought it took a great deal more.

Q. You would have thought about 10 per cent. from your experience was a fair figure for all these incidental engineering expenses?

A. No; when they did it. They do not do the engineering. Mr. Mayer or the contractors' engineers are the men who make all the plans. They do not have anything to do except the general work. There is not a plan that they make up as a general thing.

Q. There is not? You do not think there was any general planning at all to create that great Astoria plant and to provide for the running of the lines, and the filling and location of the tanks and the testing of the ground, and the thousand and one things that you would have to do?

A. Yes, there are a thousand and one things to do, but it is not done by their force. I know the proportion——

Q. Don't you know they were planning for years in the Astoria plant, in reference to the Astoria plant, figuring it out, before
5388 they ever let a contract and called a contractor into it?

A. They stated they were thinking of it for sixteen years.

Q. Didn't you know that they were planning for years, actually preparing the plans, and that it took years to prepare the plans ultimately?

A. No, I know it would not.

Q. Well, you are not able to divide up this three per cent. into any items of cost?

A. That covers more than ever I knew of a person getting from a gas company for general planning, and aside from the contractors and engineers. You understand, of course, all the detail work of planning is done by the contractor's engineers. Do you suppose the holder plans and those things are made by the company?

Q. Do you suppose in laying out the plans of the Consolidated Gas Company that they called upon the contractors to plan or formed their own plans as to the character of plant before they went and asked for bids?

A. No, sir; they called on contractors for their plans every time.

Q. You were not on the inside, I suppose, and you did not know anything about this; this is simply your surmise?

A. I know that is the case right straight along.

Q. Is it not your surmise?

A. No surmise about it. I know the contractors——

Q. Do you know what was done in the case of the Astoria plant of the Consolidated Gas Company, whether it was planned by the company or contractors?

A. No——

Q. Answer my question.

A. I was right in there and saw the figures they charged to the engineering of that plant.

Q. Do you know whether the plans for the Astoria plant were drawn by the company or whether they were drawn by the contractors? Answer that question yes or no.

A. I know the general plans were drawn by the company——

5389 Q. Very well.

A. The general plans, yes.

Q. How about this three per cent., do you include not only the general engineering but also the paving and curbing there?

A. The paving and curbing has been allowed for very liberally in those different plants in the addition made there under specific name; but that $281,000 represents a great deal more money than was paid out for any planning by the Consolidated Gas Company to anybody.

Q. We are not talking about he Astoria plant, this is an estimate which you have made of the value of ten or eleven separate plants on the Island of Manhattan, planned at different times and in the past. Now, you say that three per cent. would cover all the expenses of the company outside of the contractor's charges?

A. Yes, sir.

Q. In all those plants?

A. And more too.

Q. That is your opinion?

A. Yes, sir; that is my opinion. It is based on forty years of experience in the gas business.

Q. It is not based on any experience in New York City in constructing plants here, is it?

A. Why, Mr. Mathewson, I have seen these plans made out by the contractors in each case.

Q. You have seen the plans made out by the contractors for the New York Gas Light Company which was built in 1825?

A. I saw the plans made for a great deal of that apparatus.

Q. Did you see that?

A. The original plans, no.

Q. Did you see the plans made out for the Manhattan Company plant, which was organized about 1830; did you see those plans when that was built?

A. No; but I saw plans from the time I commenced to take an interest in the gas busineess, and I know absolutely that the planning of details of gas holders, machinery, and even retort settings, and the whole of the individual parts of a gas plant are planned
5390 entirely by people independent of gas companies and outside of them.

Q. I am talking about the Consolidated Gas Company and its plants, meaning the plants of the constituent companies and as they have been improved to date. Have you, in a single instance, seen their plans so that you know just what the plans of the company originally covered?

A. I know a good many of them.

Q. Have you been over one of them?

A. One of them, yes. I have seen dozens of the plans and copied from them.

Q. Of this Consolidated Gas Company?

A. Of this Consolidated Gas Company and these retort house settings and the whole paraphernalia there, I have seen from time to time the plans. I got them when Mr. Farmer made plans, when Mr. Sebatten directed the plans made and on until the time of the Smiths, when the Tessie Demmoto process came in. I saw how they were put in and I state this without any reservation: The engineering of those plants, except the general arrangement and telling where to put pieces, comes from the genius and work of those engineers who are employed by contractors. Now, you will find that is so.

Q. You think that the outside contractors who construct the buildings and plants have to do the sewering and draining of the property?

A. No; I say that is all right, there is a certain general——

Q. They do not have anything to do with the curbing of the street?

A. No.

Q. They do not have anything to do with the original grading?

A. Well, frequently they give plans for that. They give plans for the tanks and gas holders, for the apparatus; for nine-tenths of all expenditure incurred in that work the planning is made by the genius of independent engineers and not the regular company engineers.

5391 Q. Did you see any plans or do you know who made the plans in reference to the laying out of the Twenty-first Street works as they now exist; have you got any information about those?

A. I know in the plans for the Lowe apparatus they had no finger in the pie in connection with it and that is——

Q. If you know as much about that, don't you know that the Twenty-first Street plant was erected under the superintendence of Dr. Humphreys here, and don't you know he was constantly engaged with Chief Engineer Bradley and his assistants for a long time in planning and laying out that plant, or don't you know about that?

A. So far as that is concerned, it may be raising a roof or something like that——

Q. No, my question is clear enough. You pretend to have great knowledge on this. Do you know that which I have just stated, or don't you know it, as to the Twenty-first Street plant?

A. I know that that does not contravene what I say, I do know the very fact that they employed an outside engineer in that case shows they did not do it themselves.

Q. Well, they paid them, not the contractors who put in the machinery, did they not?

A. In some particular cases, yes. In that $281,000 I include all the engineering required for, outside of the special detail plans that are always gotten up by the contractors.

Redirect-examination by Mr. Kirby:

Q. Mr. Edgerton, outside of the specific apparatus which you have mentioned as that which you consider was designed in detail by the contracting engineer; the three per cent which you have just made reference to, being in addition to the total value of plants, is for the general laying out of these plants, the buildings, and 5392 all work connected therewith, including superintendence and inspection, is it not?

A. Yes, sir.

Q. And am I right in saying that that amount is based upon what you consider proper from your experience and the experience of others which has come to your knowledge in such matters?

A. I have never heard of anybody getting more than that ratio or that proportion.

Q. You have spoken of having made appraisals of certain apparatus, such as engines, pumps and so forth, by taking the price which a contractor would erect them for. Does that also apply to benches, generators and so forth, or were they calculated by weight and the cost per unit?

A. The report benches were calculated out in detail and confirmed by getting the figures of what that kind of work had been done here for and what contractors were willing to do it for who would do it in good shape.

Q. And you have used in the calculation of work upon these benches and such other parts of the work as you have made reference, as well as upon the buildings and foundations and tanks and holders and all apparatus where a price for a specific apparatus itself was not used, certain costs of material, certain costs of labor, and certain costs of material in place. You have given some of these. Have you a table showing just what units you did use?

A. Yes, sir.

Q. (Handing paper.) Is that it?

A. That is the table.

Mr. **Kirby**: I will offer it in evidence.

Mr. **Mathewson**: Let him state it as part of his evidence.

Mr. **Kirby**: Very well.

The **Witness**: The cost of labor and cost of material which I used were as follows:

5393 Consolidated Gas Company.

Schedule of prices for *materials*, for *labor*, and for *certain material erected*, the same as given, being those used in appraising value of the plants of the Consolidated Gas Company.

Materials.

Cement, Portland	$1.75 per barrel.
Cement, Rosedale	$1.00 per barrel.
Lime	$1.40 per barrel.
Sand	$1.25 per cubic yard.
Gravel	$1.50 per cubic yard.
Broken stone	$2.50 per cubic yard.
Steel shapes, f. o. b., New York	.01.345 per lb.
Steel plates, f. o. b., New York	.01.895 per lb.
Brick, ordinary building	$7.50 per 1,000.
Brick, pressed	$12.00 to $20.00 per 1,000.
Fire brick, No. 1	$20.00 to $30.00 per 1,000.
Special shapes, blocks and tiles	$1.00 per 100 lbs.
Slate, depending on size and quality	.08 to .14 per sq. ft.
Blue stone, dressed	$1.50 per cub. ft.
Timber—spruce, maple, oak or yellow pine	$20.00 to $35.00 per 1,000 B. M.
Piles	.15 per lin. ft.
Cast iron	2½c to .03½ per lb.
Retorts	$20.00 each.

Labor.

	Per hour.
Bricklayers	$ .70
Bricklayers' laborers	.37½
Rockmen	.20
Drillers	.37½
Drillers' helpers	.18¾
Steam engineers	.35 to .43
5394 Carpenters	.60
Laborers	.15 to .20
Blacksmiths	.37½
Blacksmiths' helpers	.21⅞
Hoisters	.31¼
Teams	.60
Riggers	.40
Steel erectors	.70
Stell erectors' helpers	.30 to .50
Machinists	.40
Pipe fitters	.45
Pipe fitters' helpers	.30
Concrete mixers and barrel men	.31¼

Materials Erected.

Excavation—	
Ordinary earth	$1 to $1.25 per cubic yard
Rock	$2 to $4 per cubic yard
Concrete	$6 to $8 per cubic yard
Brickwork—	
Ordinary brick	$14 to $20 per 1,000
Pressed brick	$20 to $40 per 1,000
Lumber	$35 to $60 per 1,000 ft. B. M.
Steel	3½c to .05 per lb.
Cast iron, rough	.04 per lb.
Cast iron, planed	.05 per lb.
Steel plates	.05 to .07 per lb.
Slate roofing, including sheathing and wood purlins	.25 to .30 per sq. ft.
Blue stone	$1.60 to $2.25 per cub. ft.
Lantern ventilators	$3 to $10 per running foot.
Piles	$6.50 to $8 apiece

Q. Do I understand that the prices which you have given are
those which you have ascertained, and which, tested by your own
knowledge and experience in such matters, seem to you to
5395 be correct and proper for the material and labor which you
have referred to?

A. Not only that, but I took the trouble to consult with people who have done work——

Mr. **Mathewson**: I do not think that is the question. I shall object to this testimony as to third parties.

Q. You can say yes or no to that.

A. Yes. I think it is more than adequate in some cases.

Q. You have referred to the Twenty-first Street plant and have spoken of certain foundations which were mentioned in the schedule and which you did not figure in your appraisal. Did you see any indication of these foundations in the plant when you were there?

A. No, sir. No indication and nothing to stand on a foundation that required the supporting of any weight of any amount. In fact, I saw in a number of cases they were supported on the floors and no indication of any requirement of foundation underneath to support those small articles.

Q. You have also spoken of the piling under certain of the buildings, questioning whether or not they were there. You did, however, in figuring the cost of these buildings, use specifications as given by Mr. Mayer, did you not?

A. Yes, piling was put in where he stated, but I state myself, explicitly, that I do it under protest, for I do not believe there is any piling there.

Q. You have also referred to the amount allowed for painting where such painting was necessary. Do you consider that that is included in the 10 per cent. which has been added to the net cost of buildings?

A. There is no painting to be done of any consequence, except where it has been provided for. The painting of all that apparatus is a thing the company takes care of after the contractors have put it up.

5396 Q. Outside of the apparatus?

A. It goes into their operating expense, if they paint it from time to time.

Q. Outside of the apparatus, in reference to the buildings and such parts thereof as would need painting, do you consider that the 10 per cent. you have added is sufficient to include what might have to be paid for painting if there were any?

A. Yes, that was intended to cover any omissions and contingencies, but if there was any evidence of apparatus requiring painting I think I would have seen it.

Q. Yesterday you were asked by Mr. Mathewson in reference to the Forty-second Street holders and you stated that you could not find the detailed estimate of the cost of those holders. Have you them at hand now?

A. Yes.

Mr. **Kirby**: If you would like the details of that, Mr. Mathewson, I will have him put it in.

Mr. **Mathewson**: Did I not ask him about another holder afterwards?

M. **Kirby**: Yes.

Mr. **Mathewson**: I understood he said he proceeded similarly in the case of all holders as to price of material and details and so forth. I do not know that I care to ask him any further.

Q. Give us the detailed estimate of that holder?

A. It was commonly found that there was an extreme difference between my estimate and Mr. Logan's and somebody else——

Mr. Mathewson: Mr. Marks was the other person.

The Witness: Well, Mr. Marks did not pretend to go over those.

Mr. Mathewson: Well, he has testified himself as to what he did.

5397 Q. Proceed and give the details.

A. That holder, as calculated by myself, weighs more by the pressure by 7-10 of an inch than as given by Mr. Mayer; in other words, it has a pressure of 5.12 and that calculated out and corrected is equivalent to 188,700 pounds, and I found that in that estimate I took it at ten cents a pound.

Mr. Mathewson: That is each holder, is it not?

The Witness: It is No. 4 holder; there are four similar holders.

Mr. Mathewson: You are referring to the four holders Mr. Logan gave at $120,000?

The Witnes: Yes.

Mr. Mathewson: $30,000 each?

The Witness: Yes. That holder at 188,700 pounds would be Mr. Mayer's figures, $12,475, and $4,800 for the guide frames and cast iron work that would be $17,225.

Q. For each holder?

A. For each holder, so I think I have allowed there on that $73,900. It comes out at $68,868 according to the memorandum which I used.

Q. For the four how much?

A. $68,868, and including the tank iron work, brings it up to $73,900.

Q. The figure set down in your appraisal?

A. Yes.

Q. In placing the value upon these holders you ascertained the weight in a certain way or by a certain method. What was the method you pursued?

A. I took, by the most accurate gauge I could get constructed, the pressure on the holder, the water pressure; that is an exact balance with the total weight of the moving parts of the iron work of the holder; in other words, the water supports the total weight of 5398 the holder, and by taking the cubic feet of water displaced by the weight of the holder, we have 62.4 pounds, which I have allowed, although that was slightly in excess, which gives quite exactly the weight of the moving parts of the holder with due correction. I have taken into consideration the levity of the gas, that is the difference between the weight of the gas and air and the submerged iron of the holder and also the water in the cups, deducting the water in the cups and allowing for the difference in weight of iron and water and above water. That gives us as accurately as it is possible to calculate it the weight of the moving parts of the holder, which includes all the sheeting and all the internal frame work and the guide rollers and everything connected in fact with the moving parts.

Q. Now, in calculating the weight of the framework did you assume the thickness of material to be as stated, or did you, in some instances, measure it for yourself?

A. In the case of where it could be measured, for instance, where there was a hole drilled in any of the columns so as to admit of measurements, I measured it. I found some of the holders were girded with steel columns of one-half inch thickness, and in some cases they were cast-iron and open-work framing like that of the Forty-second Street holders. I believe in one or two cases cast-iron columns, which I stated I calculated at one inch in thickness, but I find I calculated one and one-quarter inch.

Q. Did you make these measurements in a rough way or were they of such character as were proper in an operation of that kind?

A. I made them as carefully as they could be measured, particularly the weight of the gas holder itself.

Q. In measuring the frame-work did you measure that, did you use a rule?

A. I measured them by caliper and mechanic's steel rule, and in the cases of thickness of iron and steel, Mr. Woodward in one
5399 case, went inside of the gas holder column with considerable difficulty and got the thickness of the thimbles by which they were held together, and in every case I think I have made full allowance for the weight of those holders in framing and also in the prices applied.

Q. Your attention has been called to certain statements in your appraisal where you state the value as per Mayer or per Mayer. Now, I take it, that when such statements were made it was not necessarily because you agreed with Mr. Mayer, but because you either lacked time or opportunity of information to value the apparatus yourself; is that so?

A. Yes, throughout, as stated as per Mr. Mayer, it was on apparatus that I had not made estimates on. I could not for want of time, as I stated in undertaking it, I should have time to inspect and calculate out only the larger parts.

Q. Referring to the generator and boiler house, the schedule of apparatus of the Forty-fourth Street station, I note, two 8-foot 6 U. G. I. Co. sets, which you give a value of $18,000; for 12-foot U. G. I. Company sets to which you give a value of $47,000. Underneath these items I see one condenser and so forth, and then down three lines, total for two above items, no depreciation, $72,438. Am I right in stating that the inclusion of $72,438 is an error and that the appraisal of the benches themselves is as set down immediately above that?

A. Yes, sir; that is an error, the insertion of $72,438.

Q. I used benches where I should have said U. G. I. sets?

A. Yes.

Q. You have testified that you figured the value of your yard connections, so-called, by a formula which your experience taught you to be the correct one. Would it not have been possible for you to have figured these connections from the information in the testimony or in the schedules?

A. No, sir.

5400 Q. Why not?

A. Why, in reference to connections it says so many feet from such a size down to another size, that is lumped altogether, except in certain cases of the holder stations.

Q. Does it state the number of each size pipe in detail?

A. It states 22,525 feet of that particular Fourteenth Street station. He has given the number of tons but——

Q. Now, other stations, is the weight given?

A. Not always. It is generally simply the aggregate number of feet. For instance, the Twenty-first Street station, cast iron pipe, 18 to 36 inches in diameter, 6,624 feet; also steel-riveted, 16 to 36 inches, 4,772 feet; then again, wrought iron pipe, 1½ to 12 inches, 1,550 feet.

Mr. Mathewson: Are you referring to the testimony or to the schedule which you had?

Mr. Kirby: The schedule and testimony are both the same. This is for the Twenty-first Street plant.

Q. This value which you have given for the yard connections you consider ample for the plant of the usual kind and character mentioned, would you not?

A. Yes, sir, and in many cases that cost of the pipe at the rate of $6.50 per thousand cubic feet daily capacity is nearly as great as the cost of the whole apparatus, generating plant; and in Mr. Mayer's estimate the cost of connection would much exceed the cost of a generating plant.

Q. The value which you have given would take care of all pipe connections, valves, etc., which would be necessary for the works of the various kinds, would it not?

A. Yes.

Q. And if there should happen to be other pipes than those which you have figured up in such plants, would you consider that 5401 such valves, pipes, etc., were necessary for the proper operation of that plant?

A. No, sir; they probably got in there due to the duplication of parts, owing to the constructing and reconstructing and changing the process of gas-making.

Q. You have given to Mr. Mathewson a general idea of the number of days which you spent inside these plants. Was this the only time which you spent in examining them? Did you make any other examinations except those you mention?

A. Well, I don't think that it gives an adequate idea of the time I spent in the plants, no, by his hour to hour business. There were a number of plants that I visited quite a number of times, and I had with me two assistants to go over portions of it, and I do not think that the timing of Mr. Mathewson really represents all the time I was around those plants; and I was there at times when they did not know anything about it, that is to see about gasholders, whether they were in use or not.

Q. You mean by that at times other than those mentioned you saw the plants from the outside of the walls?

A. Yes; the gasholders, in regard to whether certain gasholders were in use.

Q. Did you yourself, or did you have any photographs made to assist you in the examination of the kind of apparatus, holders and what not?

A. I did. I had some views taken and was also assisted by a plumber to get at the pressures of the gasholders.

Recross-examination by Mr. Mathewson:

Q. You stated correctly yesterday the amount of time you spent inside the plants, in answer to my question, Mr. Edgerton?

A. I thought in the main that comprehended the time inside. I did not entirely agree with it. I did not tabulate it in any way that would give me an exact idea, but I stayed there all the time I wanted to. 5402

Q. That is another thing. I called your attention yesterday to the hours which I understood you spent in the plant, and I understood you to say that was substantially correct. That was right, was it not, inside the plants?

A. I did not have any definite memorandum or data to contradict it.

Q. That accorded with your recollection as you stated it yesterday, did it not?

A. I did not remember anything to the contrary.

Q. Do you want to change your testimony of yesterday?

A. No.

Q. At this Forty-second Street holder, where there was such a difference between you and Mr. Logan and the others, you say that you took the pressure and you found the pressure higher than that given by Mr. Mayer; that would indicate, as I understand you to say, a greater weight of material than he assumed?

A. Yes.

Q. In other words, the higher the pressure is the more weight of material it indicates in the holder?

A. Certainly.

Q. Per unit?

A. Yes.

Q. Where did you take that pressure, where did you apply your pressure gauge?

A. I went three times; twice I applied it at the ground level and once I crawled up on top of the holder and took the pressure on top, and I took it on the inlet pipes and on the outlet pipes also.

Q. What was the difference between the top and the ground in pressure?

A. There was, I think, about three-tenths or four-tenths; three-tenths.

Q. And which was the higher?

A. The pressure at the top of the holder. I took that pressure because that agreed with the pressure of the correction for levity of the gas.

5403 Q. You found, then, the weight in each of the four holders to be 188,700 pounds?

A. Yes.

Q. What did you compute to be the weight of the guide frame of this holder, including the columns?

A. That guide framing I took at one-third the weight of the holder. I computed that at one point at one time, but I have not the computation here.

Q. And the figures you are giving here are your general conclusions that it should be one-third the weight of the holder?

A. Yes, I think that would be correct, although I did not——

Q. You did not, then, figure each girder and all the trusses in detail?

A. I did figure that at one inch thick. That is cast iron with openings. I measured that and similar ones also at the——

Q. You have the details here?

A. No, I have not come across the detail of that figure.

Q. As to the weight of pipe and connections, what did you figure that to be for the holder?

A. That came in as the difference between $68,868 and $73,000.

Q. Yes, but what did you figure to be the weight of the connections?

A. I don't remember.

Q. You say you took ten cents as the price per pound for the entire construction?

A. I did in the first instance, but made a correction on that and took it at 6.6 cents.

Q. Yes, which is the unit you have used in computing your $73,000 value?

A. It is the 6.6—that is, it comes up to that, barring the weight of the tank iron and inlets and outlets.

Q. What do you mean by barring those?

A. I mean those are separate items, represent the value of them. I have only the value of them here which represents the difference between $68,868 and $73,000.

5404 Q. I understood you to say yesterday that you computed the holders generally upon the same general theory as to price of material and the weight of guide frames?

A. No; they were computed in different ways. There was some of those—the shells were all computed on the same basis.

Q. 6.6 cents?

A. 6.6, except in one case it was 7.1 cents.

Q. Do you remember which one that was?

A. That was the one in which Mr. Mayer gave his high figure on the construction. I have forgotten which one it was.

Q. Sixty-fifth Street?

A. Possibly.

Q. Well, that was the one with the many braces, was it not, the patented construction?

A. Yes.

Q. And as to guide frames, as a rule you consider them one-third the shell?

A. No; the guide frames are computed by weight of material in all instances where I could and in others the weights were duplicated. For instance, where a holder of a Phoenix column figured out to as much weight, it was adopted on the other holders of the same construction.

Q. What proportion of these were you able to or did you take actual measurements by reason of finding holes and otherwise?

A. I got measurements of pretty nearly all of them, I think, except one.

Q. Actual measurements of thickness of iron and height?

A. Yes, and diameter of columns and length, and so on.

Q. Did that include girders and diagonal braces as well?

A. Yes.

Q. In each one?

A. Yes; that is, the measurements I took. I did not calculate them all out.

Q. In what proportion of the guide frames here do your figures represent actual computations of weight and so on from actual measurements of columns, girders, trusses, braces, and so forth?

A. I took measurements of nearly all of them. I say they 5405 are not calculated all out. Some of them, they are very intricate.

Q. I ask you what proportion were calculated out and made the basis of the figures of value you present here now; was it a quarter of them?

A. I cannot just say the proportion. I think I stated in the testimony right along where I took a proportion yesterday when I was testifying.

Q. Well, but I did not go over one-tenth of them yesterday, so you could not have stated. I ask you now, what proportion of the whole would you think you have calculated out and made the value here given the result?

A. Do you want me to go over the whole list?

Q. No; I merely asked you what proportion?

A. I think over two-thirds of them were calculated out. I think some of those columns were the only ones left out.

Q. And in two-thirds of the cases where you have given values of holders, does that include the value of frames based upon such calculation and not based upon the theory that the frame was one-third as much as the shell?

A. Yes; I think that I gave the calculations on at least two-thirds. I could divide it better by saying that the column guide frames were not calculated in every case like the other guide frames. They were taken at a proportion of the whole.

By Mr. Kirby:

Q. You did calculate out certain guide frames, did you?

A. Yes.

Q. And where you say that the column guide frames were not calculated, what do you mean?

A. I mean that in going around the first time, and, in fact, the second time, I was not able to get at the measurement of those 5406 guide frames; and then I discovered that some of them had holes drilled in them, by which I could get the thickness of the iron, and then I calculated them out.

Q. Then you did, in fact, calculate them?

A. I calculated out, I suppose, two-thirds of those guide frames.

Q. And where you did not take measurements of every small part of that guide frame, what did you do?

A. If it did not have a counterpart in some other guide frame of the same construction, I calculated it as a proportion of the weight of the whole, taking Mr. Logan's, I think it was, proportion and my own figures as a guide as to what proportion the guide frame would bear.

Q. I do not mean the guide frame as a whole, but I mean the small parts thereof; you did not measure every part of every guide frame, did you?

A. No, not necessarily. One column or one girder or one bay or rail of a guide frame establishes the whole business; if it had sixteen columns, and one column calculated out so much, together with its girder and cross and guide rails and the wall plates, we multiply that by the number of columns.

Q. But in this two-thirds of these frames, which you did calculate by measurement, you did measure the details of one bay, or whatever you call it, to get the unit, and then multiplied that by the number of those parts which should be in the total frame, did you not?

A. Yes; which are duplicated.

Q. In those which you did not calculate in that way you took as the cost of the framing one-third the cost of the shell or other parts of the holder?

A. Yes.

Q. That is one-third of the cost and not of the weight?

A. Yes.

Q. And where you have mentioned, in reference to the Forty-second Street holder, one-third the weight, you mean one-third the cost?

A. Yes.

5407 By Mr. Mathewson:

Q. You had a man to help you with these measurements, did you not?

A. Yes, sir; several men.

Q. How many, on the average, just for the measurements, I mean, who did the measuring?

A. Three.

Q. You, yourself, and three men?

A. Yes, sir.

Q. You did not confine yourself to measuring; what proportion of your time did you put in in measuring, or did they put in while they were in the plant ?

A. Oh——

Q. A small part, wasn't it?

A. A small part, in taking the pressure, sometimes we were delayed in it, climbing up to the top of the holder would make some delay.

Mr. Mathewson: I have nothing further.

Mr. Burr: I have only one thing to call to the Master's attention. On page 4,284 of the testimony, the stipulation which was made between the city and Mr. Mathewson regarding deeds and grants, we made mutual concessions, and the language on that page is, you say: "In view of that, and as it will save us the trouble, I think we will withdraw, and I do withdraw the objections to these grants. It should be maps and grants. Have you any objection to that?

Mr. Mathewson: No, I have no objection.

Mr. Burr: Will your Honor take judicial notice of the distances on the East River and North River, or will that be the subject of a stipulation? Will it be conceded that a distance of two miles north from Corlear's Hook on the East River extends to and above Twenty-third Street, East River, and that the distance four miles north of Bestavers Killitje at or near the foot of Charlton Street extends to and above Forty-sixth Street, North River? This concession
5408 is asked for, for the reason that there is nothing in the case to
show the distance of each river to which the Letters Patent of 1807 extend northerly from the southerly point mentioned in the said Act. As a matter of fact, this distance extends on the East River pretty close to Thirtieth Street, and on the North River within a couple of blocks of Seventy-second street, as scaled on the city's map.

Mr. Mathewson: As to the fact, there will be no difficulty about that, but I cannot concede this because I don't know it.

The Master: I cannot take judicial notice of it, but I assume if one of Mr. Mathewson's engineers happens to know about it, he will probably concede it.

Mr. Mathewson: Yes, you arrange with Mr. Mead and Mr. Booraem about that.

The Master: I understand the defendants' case is closed now?

Mr. Kirby: So far as the Attorney General and the State Gas Commission and the District Attorney of the County of New York is concerned, it is closed.

Mr. Burr: The city rests.

The Master: Then according to our discussion the other day, I understand you want to have a recess until Monday, the 14th instant, at 11 a. m.

Mr. Mathewson: Yes, that will be the four days which the Court seemed to think was fair.

Adjourned to Monday, January 14, 1907, at 11 a. m.

Last Exhibits:

Complainant's 270.
State's OOO.
City's 136.

5409 United States of America,
Southern District of New York, ss:

I, John A. Shields, Clerk of the Circuit Court of the United States of America, for the Southern District of New York, in the Second Circuit, do hereby Certify that the foregoing pages, numbered from 4537 to 5408 inclusive (Vol. 7), contain a true and complete transcript of the record and proceedings had in said Court, in the cause entitled Consolidated Gas Company, Complainant, Appellee, against Julius M. Mayer, as Attorney General, *et al.*, Defendants-Appellants, as the same remain of record and on file in my office. (Vol. 7.)

In Testimony Whereof, I have caused the seal of the said Court to be hereunto affixed, at the City of New York, in the Southern District of New York, in the Second Circuit, this 15th day of May, in the year of our Lord One Thousand Nine Hundred and eight and of the Independence of the said United States the One Hundred and thirty-second.

[Seal of U. S. Circuit Court, South. Dist. New York.]

JNO. A. SHIELDS, *Clerk.*

[Endorsed:] United States Circuit Court of Appeals for the Second Circuit. —— —— *vs.* —— ——. Transcript of Record from the Circuit Court of the United States for the Southern District of New York.

5409½ Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York, WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

JANUARY 14, 1907.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Page, Mr. Kirby.

U. S. Circuit Court, Southern District N. Y. Filed June 24, 1907, John A. Shields, Clerk.

5410 **Mr. Burr**: Professor Bemis has recovered his health and is here from Cleveland. He calls my attention to the fact that a number of corrections should be made in his testimony. I have sent a copy of the corrections to Mr. Mathewson and will give him a copy of some additional corrections to which the Professor has called my attention this morning. I merely state this, so that the figures on which Mr. Mathewson may base his rebuttal shall be correct. I explained the matter to Mr. Mathewson over the telephone, and I think he understands the situation.

Another thing I want to suggest is this, that inasmuch as this is to be rebutted, to save time and for the convenience of all of us, the particular testimony which is to be rebutted should be called specifically to the attention of counsel and the witness. That is, I mean, the record has grown so immense that it would be well to call attention to the page of the testimony which you seek to rebut.

Mr. Mathewson: I do not know that I can do that in all cases. I can in many cases, but a good deal of the testimony for the defendants is so general and from so many witnesses that it would be, I think, not of any advantage to do that. For instance, on the subject of pressure and one thing and another.

Mr. Burr: Well, wherever it is possible I think it would be to the advantage of us all if that could be done.

Mr. Mathewson: Yes, I will do what I can in that regard, of course.

Herbert J. Long, called as a witness in rebuttal in behalf of the complainant, being duly sworn, testified as follows:

Direct examination by Mr. **Mathewson**:

Q. Where do you reside, Mr. Long?

A. Pittsburg.

5411 Q. With what corporation are you connected?

A. The Monarch Water Heater Company.

Q. Is that the manufacturer of the apparatus that is generally known as the Monarch Water Heater?

A. Yes, sir.

Q. Does the business of that company cover the United States generally, or a section?

A. The entire United States.

Q. A large business, is it?

A. Why, it is considered such; that is, in comparison with other gas appliances.

Q. How long have you been secretary and treasurer of the company?

A. I have been since June 1st, 1906.

Q. You have been in the business for seven or eight years?

A. Not quite seven; six and one-half years connected with the company.

Q. To whom does this company sell its apparatus, to direct customers or the retail trade?

A. In most cases direct to customers, by means of agents in the field, our own representatives.

Q. Individual consumers of gas?

A. To individual consumers; in the larger cities, where it will pay to have a representative, we sell direct.

Q. Is this apparatus to be operated by gas?

A. Exclusively with the use of gas.

Q. Now, have tests been made as to the pressure at which this gas water heating apparatus shows its efficiency and below which it is not efficient?

A. Yes, and that has been necessary——

Mr. **Burr**: Objected to. What connection has that with the matter in hand?

Mr. **Mathewson**: You have introduced testimony here by Mr. Edgerton and by Professor Hallock and some others, particularly Mr. Edgerton, in this regard, that the most efficient pressure is under one inch.

5412 Mr. **Page**: For illuminating purposes?

Mr. **Mathewson**: No; and for other purposes too; that a range and other apparatus can be operated at a pressure under one inch satisfactorily.

The **Master**: I will allow it.

Mr. **Burr**: Exception.

The **Witness**: Your question was whether we had made tests?

Q. Yes.

A. I will answer yes, and that it has been absolutely necessary in our business to make tests in every locality, not only in cities, but in parts of cities where we develop the sale of heaters, on account of the fact that lack of pressure destroys the efficient operation of the machine.

Q. What do you find to be the minimum pressure required for the operation of that apparatus?

Mr. **Burr**: Objected to as incompetent, irrelevant and immaterial.

The **Master**: Same ruling.

Mr. **Burr**: Exception.

A. We find that we will not install knowingly on lines having less than twenty tenths.

Q. That is, two inches of pressure?

A. That is two inches of pressure.

Q. Taken where?

A. Taken inside the house. We usually take our test on any gas bracket that is available in the house, inside the meter.

Q. And at a point where it is intended to instal the apparatus?

A. As close to that as it is possible to get. We also specify that pipes shall be run of a certain specific size or the guarantee does not hold good with the pressure.

Q. Have the tests which have been made been confined to one place or have they been made over the country generally?

5413 A. Covering a period of seven years, they have been made all over the country by our representatives and in many cases experts sent out from the factory.

Q. And if after an apparatus is installed, less than two inches of pressure develope at the apparatus, what is it necessary to do? Can you operate the apparatus efficiently?

A. Well, it is necessary to operate the apparatus and get the highest efficiency we can get from a lower pressure, and if the customer is satisfied with it, he retains it. If, however, it is not coming up to the guarantee, in many cases it has been necessary to remove the heaters.

Q. Do you guarantee where a pressure of less than twenty tenths is obtained?

A. We do not guarantee the apparatus to come up to its best service.

Q. As a matter of fact do you know that it does not.

A. Yes, we know it does not or we would not make such an absolute ruling.

Q. Have you taken any tests in the City of St. Louis as to high and low pressure at the same time?

A. I have personally done that on account of variations in pressure. I have personally made a trip to St. Louis on that account and found variations of from fifteen——

Mr. **Page**: What relevancy has it?

Mr. **Mathewson**: Let him finish it, and I will tell you.

Mr. **Page**: Objected to as wholly irrelevant and immaterial.

The **Master**: I cannot tell that yet. I will let him proceed.

Mr. **Page**: Exception.

The **Witness**: I found—I will not say simultaneously, but as fast as I could get from one point to another, a difference of 5414 fifteen to eighteen tenths and other places as high as forty tenths.

Q. That is fifteen tenths and forty tenths at practically the same moment?

A. Yes, as fast as I could travel from one point to another.

Mr. **Page**: I renew my objection and move to strike out the answer.

Mr. **Mathewson**: Mr. Edgerton testified that as to the City of St. Louis particularly the pressure could be kept with certain limits there, and in reference to the high pressure system of mains which he said was there and which was similar to something which he advocated, and I am showing that the pressure even there is not between the limits which the law here requires. He was the one who brought in St. Louis.

Mr. **Page**: I do not remember any testimony by Mr. Edgerton as to the pressure system of St. Louis.

Mr. **Mathewson**: He testified that a high pressure system was in force in St. Louis. I think it was from him, or one of the other witnesses, certainly.

The **Master**: I will let it stand for the present without prejudice to move to strike it out later if at the close of the case it should transpire there is not any connection established.

Mr. **Page**: Exception.

Q. In the various tests which were made, what was found to be the most economical pressure for the operation of the water heater.

A. Well, we have found the higher the pressure the greater the economy and the operation of the heater.

Q. That is, there is less gas required to produce the heat?

A. There is less gas required to produce the desired heat; to produce the desired temperature; for instance, in Los Angeles 5415 we have found where they carry as high as forty tenths almost constantly, we get the best results, the most economical result from the water heater.

Q. What is the character of St. Louis as to elevation, etc., and other characteristics governing the control of pressure?

A. I have not statistics, but it struck me as being a particularly level city. I go there frequently; I should think it would be exceeding- favorable.

Mr. **Kirby**: I move to strike that out.

The **Master**: Same ruling.

Mr. **Kirby**: Exception.

Q. Has your company any connection with any gas company?

A. None whatever.

Mr. **Mathewson**: That is all.

Cross-examination by Mr. PAGE:

Q. What is this water heater which you manufacture, what is it used for?

A. It is an apparatus which is composed of a series of copper coils through which the water passes, under which is placed a Bunsen burner using gas, and it is designed to supply domestic hot water to the various fixtures in a house or apartment or building, and it is operated automatically.

Q. That is, when you turn on the water it turns on the gas?

A. It automatically turns on the gas and heats the water instantaneously as it passes through the coil.

Q. And what you use is a Bunsen burner?

A. We use a Bunsen burner.

Mr. PAGE: I do not think we need to ask anything else. I suppose it will be conceded that Bunsen burners will operate better under a high pressure than under a low pressure. 5416

The WITNESS: Might I make a suggestion as to another reason why we required the higher pressure?

Q. Yes. Anything that is peculiar to this apparatus.

A. Well, it is possibly peculiar to this apparatus, and that is that we find in the operation of the heater, the use of the gas with the heater, if the pressure is too low, it tends to pull upon the main in such a manner that we would not get proper service, so if we have low pressure we are utterly unable to operate the heater. Many times we are unable to operate it for any service if the pressure is low, and other times it will operate with poor service.

Q. How did you make the tests which you spoke of having made yourself?

A. We use a *guage* and attach it to the ordinary cocks or gas bracket that is usually in the basement.

Q. Are you an engineer?

A. Well, I had no college degree as an engineer. I am a mechanical engineer and have designed several improvem-nts to the heater and have taken out several patents on them, and studied—I spent about three or four years after leaving school on survey work and things of that kind, but have not a college degree.

Q. Does this apparatus have a pilot light that is burning all the time?

A. Yes, it has a constantly burning pilot.

Mr. PAGE: That is all.
Mr. BURR: No questions.

Redirect examination by Mr. MATHEWSON:

Q. What is a pilot light?

A. Well, my definition of a pilot is a small jet which is burning constantly for the purpose of igniting the main burner when required. 5417

Q. A very slight——

A. The smaller the consumption the better for us; we aim to turn it down as low as we possibly can.

Q. It burns half a foot an hour or——

A. From a minimum of half a foot an hour it often runs as high as a foot an hour.

Q. Referring to Bunsen burners, are not the Bunsen burners you use of the same principle of the Welsbach and Bunsen burners used in gas stoves?

A. It is exactly the same principle, we use a vertical tube.

Q. The air mixed with gas in certain proportions?

A. Yes.

Q. Do you know any reason why the operation should not be the same as to pressure?

Mr. Page: That is objected to. I do not know that he knows anything about it.

The Master: I will allow it.

Mr. Page: Exception.

A. From my personal experience and others I should judge that the same condition would hold good in both cases.

Mr. Mathewson: That is all.

Colin C. Simpson, recalled in rebuttal on behalf of complainant.

Direct examination by Mr. Mathewson:

Q. You have testified before in this case, have you?

A. I have.

Q. Will you not at the outset state somewhat more at length than you have heretofore, your experience in the business of laying gas mains, and your knowledge of the condition of subsurface structures in New York City. 5418

Mr. Page: I think he has testified very fully.

Mr. Mathewson: I do not think he has testified quite so fully as he can.

A. May I read this right off (indicating paper)?

Q. If that is what you want to say, yes.

A. I have made a specialty of the business of main and service laying for twenty-eight years (four years in Vienna, Austria, laying water mains and twenty-four years in Manhattan). Have personally watched the exposing of approximately 90 per cent. of the Consolidated, New Amsterdam, Mutual and Standard mains. Have supervised the laying of the greater part of the Consolidated Gas Company's mains. Also watched the laying of practically all of the New Amsterdam and Standard mains, and about 30 per cent. of those of the Mutual. I have watched the building of underground telephone and electric light subways from their very inception. I have also watched the laying of all large water mains—30-inch, 36-inch and 48-inch—since 1889. And the building from start to finish of the Rapid Transit Subway. I have kept records of all mains laid by other gas companies for the last seventeen years. I have watched the laying of all mail tubes and the construction of the cable and underground trolley systems of all surface railroads, also the excavations for the Pennsylvania and New York Centrals Terminals.

I designed and had laid under my personal supervision the 48-in. gas main on Avenue A, between sixty-second and seventy-first streets, New York City, which (with the exception of the 60-inch gas main in Long Island City) is the largest gas main in this country 5419 to-day; and in conjunction with our Chief Engineer, Mr. William H. Bradley, designed the 60-inch gas main in Long Island City, from our new Astoria plant to the tunnel crossing the East River under Blackwell's Island and personally supervised the laying of same. This 60-inch main is three miles long, is the largest gas main in the world to-day, and is now being successfully operated. This main was laid under extreme conditions; many of the streets through which it passed were not even graded, necessitating in some places going down to a depth of twenty-five feet, and in other places making "Fills" of from ten to fifteen feet high. At Broadway and Van Alst avenue it was necessary to go under a large trunk sewer——

Mr. Page: I suppose all those mains laid over in Long Island——

Mr. Mathewson: He is showing his experience.

Mr. Burr: Yes, and he has made statements as to the operations of the mains meanwhile. He says it is now being successfully operated, and I think that is hardly rebuttal. It is something we will have to find out about still more.

The Master: He may proceed.

The Witness (continuing): At Broadway and Van Alst Avenue it was necessary to go under a large trunk sewer, and we here reached a depth of 29 feet and had to contend with tide water and a live underground stream. In crossing Sunswick Creek it was necessary to provide large culverts to take care of the tidal flow of the Creek.

There has not been a single sub-surface structure of any consequence constructed on the Island of Manhattan during the last seven- years which has not necessitated my rigid inspection, as there 5420 are probably no streets in Manhattan which do not contain at least one gas main, and to protect these it is necessary for us to most carefully watch all underground work.

In fact, I can assert that I have a better general knowledge of subsurface conditions in Manhattan than any other one person.

Q. Are the estimates which you have made and which you are producing to-day based upon theorizing, or are they based upon your own absolute knowledge and experience?

A. My absolute knowledge and experience and from actual data of cost that I kept.

Q. Now, I understand, Mr. Simpson, from your previous testimony that the mileage of the mains of the Consolidated Gas Company, the details of sizes, is kept in the books of the Consolidated Gas Company?

A. Yes, sir.

Q. I don't mean the maps, of course, but the books and records?

A. The books.

Q. And whenever any main is laid, has your department a record of that laying, including the length of the main and the size and so forth?

A. Yes, sir.

Q. And does it report them to the Accounting Department after laying that main?

A. Yes, sir.

Q. How often?

A. Once a month.

Q. And those reports then are entered in the Accounting Department, are they?

A. They are.

Q. From the original records which you used on it and sent up?

A. No; they are entered in the original record in my department, and the data is given to the Accounting Department from my record.

Q. You say that since the formation of the company you have been over and seen at least 90 per cent. of the present main mileage of the company. Have you ever found an instance where the 5421 main, as disclosed on the records of the company, was not found in the street when you came to uncover that place?

A. Never; not in any one single case.

Q. And is it your judgment, therefore, that the records of the company are correct as to mains?

A. It is, sir.

Q. Have you ever had any report from any of your superintendents or any men employed by you that any main which appeared on the records of the company was not found when they were uncovering the street for the purpose?

A. Never.

Q. Where is the distance of the main from the curb recorded on the maps or in the records of the company?

A. On the books of the company, not on the maps.

Q. It does not appear on the maps, does it?

A. Doesn't appear there at all.

Q. How about the depth and the exact measurements between given points?

A. All on the books, not on the maps at all.

Q. None on the maps?

A. No, sir.

Q. How and when are mains placed on the maps?

A. Well, as soon as reports are received they are placed on the books, and as soon as placed on the books they are put on the maps.

Q. Are they put on the maps from the records of the company, or are the records of the company made up from the maps?

A. No; they are put on the maps from the records of the company.

Q. So that as between the maps and the records of the company, if there was a divergence, which would be correct?

A. The books would be correct.

Q. Now, when you send up to the Accounting Department a record of a main, do you give any detail or do you have any detail as to its length and the bounds, and as to those used and that are not used and all that?

A. Yes, sir.

5422 Q. And are those records kept?

A. Yes, sir.

Q. And is it possible for a main to get on the books of the company that is not actually laid?

A. Absolutely impossible.

Q. Now, in case of a fire or other accident, where would you go to get the detail of the main as to distance from the curb, the exact length, the depth, etc.?

A. To the books.

Q. Not to the maps?

A. I would go to the maps first to see what size main was on that side of the street, and then I would go to the books to find the location of it, distance from the curb, depth, etc.

Q. What use, then, do you make of maps such as the company keeps and such as were examined by Mr. Marks?

A. They are used for ready reference as to what size of mains are on certain streets and what side of the street they are on; only for that.

Q. Reference was made to your testimony in this case where you stated that the maps were correct, or you believed the maps to be correct. Do you remember your testimony in that regard?

A. I remember being asked if the maps were correct, and I said yes.

Q. Will you explain a little further to what extent you intended to be understood?

A. Well, I mean to say that they are correct. I did not see anything incorrect about them. I do not say they were drawn to scale or anything of that kind, but they were correct in so far as any mains that are in the ground are concerned, and there is nothing on those maps that does not belong there.

Q. And that was the extent of your meaning when you made that statement, wasn't it?

A. Yes, sir.

Mr. Burr: I hardly think that that is proper rebuttal, to have him qualify now, at this late date, a positive statement which 5423 he made in the beginning of this inquiry and upon which we relied and upon which we based our application for an examination of those maps, relying upon the truthfulness of the statement which he made as early as page 339 of the record.

Mr. Mathewson: Oh, you made your examination after he stated and I stated over and over again, in reference to these maps, just what he is now testifying to.

Mr. Page: The State did not rely upon the accuracy of any of the statements of Mr. Simpson.

Mr. Mathewson: They are quite accurate.

The Master: Proceed, gentlemen.

Q. Do you wish in any way to modify or qualify the previous statement that there were eight hundred and twenty-two miles of mains at the time you testified?

A. No, sir.

Q. Now, let us refer to the maps which Dr. Marks examined. The maps on which the company keeps its mains indicated are ordinary insurance maps, are they not?

A. Insurance volumes, yes, sir.

Q. And do they have a scale indicated on the map?

A. They are supposed to be drawn to scale.

Q. Have you examined the maps to see whether they agree with their own scale?

A. I have.

Q. Do they agree with their scale?

A. No, sir.

Q. Did you find in any instance that they agreed with your scale, where you measured?

A. No, sir; not a single instance.

Q. Was the actual distance longer than it showed on the map or shorter?

A. Shorter in every case.

Q. You mean the map showed a shorter distance than the actual distance?

A. Than the official measurements.

Q. So that their measurement would show less mains than actually existed?

A. Yes.

5424 Q. Now, have you examined these schedules and charts as presented by Mr. Marks, beginning with City's Exhibit 92, and from there continuing down to City's Exhibit 103, and perhaps there may have been other numbers that I have not mentioned, but I refer to all these schedules.

A. I have gone over them, yes, sir.

Q. Gone over parts of them?

A. Yes, sir.

Q. Will you state whether you found inaccuracies in those schedules, and if so, state in detail the character of the inaccuracies.

A. Why, the inaccuracies are so many that if I am allowed I will have to read them off, they are so many. In the first place, as before stated, the maps do not agree with the scale given. In every instance observed by me they are shorter than the official lengths. All the mains on five complete maps, Nos. 118, 119, 120, 121, 122; of Volume 6; have been entirely omitted.

In taking some of the volumes and comparing pages at random, there are numerous mains on the maps which do not appear at all on Prof. Marks' Exhibits.

There are also numerous cases where the lengths, as given by Prof. Marks, are shorter than actually shown, on the maps measured, even measuring on the maps themselves, according to their own scale.

There are also a number of instances where the sizes, as given by Prof. Marks, are incorrect; a 30 inch main is stated where it should be 36 inches; 3-inch main is stated where it should be 6-inch, 4-inch main given where it should be 8-inch, etc., etc., etc., the error in every case being against the company.

As the mains are not placed upon the maps to scale, this would affect the measurements given at every point where the main ends at its connection with the transverse main, because of the
5425 varying distances from the curb. In most every instance the mains are at a greater distance from the curb than would be indicated by the map. In considering the total number of such

cases, the actual increase in length over that scaled would be an appreciable item.

In addition to the errors above noted, numerous mistakes may be found in the exhibits themselves: of which the following are instances:

Mains entered on the Detailed Sheets, but entirely omitted from the Summary Sheet and, therefore, not included in the addition, or in the figures appearing on Page 4605 of the present testimony.

Mains appearing on the Summary Sheets from 50 to 1,000 feet short of their lengths as given on the Detailed Sheets.

Mains appearing in a column of the Summary Sheets which have not been totaled and, therefore, not included in the figures appearing on page 4605.

Mains appearing on the Detailed Sheets under a certain size, but appearing on the Summary Sheets under the heading of a Smaller Size.

Mains appearing on the Detailed Sheet as disused, when the main as described is shown on the map as in use, and should be included with the active main.

Cases when the active and disused totals appear on the Detailed Sheet, but the disused has been transferred to the summary Sheet and added in with the active main, while the correct length of active main, in each case much greater than the disused, has been left out entirely.

Discrepancies between the Summary Totals and the Totals given on Page 4605 of the testimony—amounting to 20,129.6 feet, against the company.

Q. That is something like four miles in that instance?

—. Yes, sir.

5426 Q. Does there appear, as far as you can observe, any possible kind of error which could have been made which has not been made?

Objection.

The Master: I think that is hardly allowable, Mr. Mathewson.

Q. Now, referring to these various classes of errors and discrepancies, did you find any instance in which the errors and discrepancies were not against the interests of the company?

A. Not one single instance.

Q. Now, let us take the first instance. You say in every instance observed by you the lengths shown on the map are shorter than the official lengths?

A. Yes, sir.

Q. Where did you get the official lengths?

A. From the official card of the city, giving street widths and block measurements.

Q. This is data of the City of New York?

A. Yes, sir.

Q. Have you a schedule showing some instances according to your measurement where the distance is shorter than the official length?

A. Yes, sir.

Q. Is this paper which you produce such a statement?

A. Yes, sir. It is as follows:

5427

Measurements of Map Distances in Insurance Volumes.

Taken by Mr. C. C. Simpson.

Measured on line of—	From—	To—	Official length.	Volume scales.	Volume is short.
8th Avenue	S. P. line, 145th Street	N. P. line, 150th Street	1399 ft. 2 in.	1394 ft. 0 in.	5 ft. 2 in.
131st Street	W. P. line, 5th Avenue	E. P. line, Lenox Avenue	895 ft. 0 in.	890 ft. 0 in.	5 ft. 0 in.
Amsterdam Avenue	N. P. line, 110th Street	S. P. line, 105th Street	1449 ft. 2 in.	1403 ft. 0 in.	46 ft. 6 in.
8th Avenue	N. P. line, 81st Street	S. P. line, 76th Street	1421 ft. 8 in.	1405 ft. 0 in.	16 ft. 8 in.
Manhattan Avenue	N. P. line, 109th Street	S. P. line, 105th Street	1147 ft. 4 in.	1135 ft. 0 in.	12 ft. 4 in.

5428 Mr. Page: I think it would be well probably if we should have just one or two of those volumes brought down and a demonstration given that they are shorter.

Mr. Mathewson: Very good. It can be done without any difficulty. Will you go ahead, Mr. Simpson.

The Witness: Now, I may say that in each case in here, of course, the entire page is wrong; because, you understand, these things are all straight lines, and if I take one avenue and that avenue is short all the rest of the avenues are short, too, and I have only taken here what I actually scaled myself.

By Mr. Page:

Q. When you referred a moment ago to the "official card of the City," that was a card issued by what or whom?

A. By the Bureau of Highways.

By Mr. Mathewson:

Q. Now, you have stated that all the mains on five complete maps, Nos. 118 to 122 of volume 6, have been entirely omitted?

A. Yes, sir.

Q. Have you a statement of those mains, the detail?

A. I have, sir; the sizes and number of feet.

Q. Now, will you please state that?

A. ——.

A. The mains on maps Nos. 118, 119, 120, 121 and 122 do not appear in Prof. Marks' exhibits.

These mains, by actual street distances, are as follows:

	3-inch	840 feet
	4-inch	25,918 feet
	6-inch	53,733 feet
	8-inch	18,187 feet
	10-inch	3,331 feet
	12-inch	8,413 feet
5429	16-inch	2,631 feet
	20-inch	6,238 feet
	24-inch	560 feet
	30-inch	10,200 feet
	Total	128,051 feet

Or 24.25 miles.

Q. Now, your estimate that the total sum of pipe by Mr. Marks, excluding abandoned mains, was about 780 miles, against 822, or 41 miles difference?

A. Yes, sir.

Q. And this would account for about twenty-four or twenty-five miles at one jump, wouldn't it?

A. Yes, sir; or more than half of it.

Q. You say in checking some of the volumes and comparing at random there are numerous other mains on the maps which do not appear at all on Professor Mark's Exhibit. That is outside of these five pages, isn't it?

A. Yes, sir.

Q. Have you a schedule of such omissions?

A. Yes, sir.

Q. So far as you have examined the schedules?

A. Yes, sir.

Q. Will you state that for the record?

A. I have not all of them. I have a statement of some of them.

Q. Yes, I mean a statement of some of them, as an example.

A. Shall I state volume number and map number, or just the street and "from" and "to" and "where"?

Q. Well, the street, from, to or where will do for me, unless counsel for the other side want the volume.

Mr. Burr: I would rather have the volume, in addition.

Q. Have you it all on this statement?

A. Yes, sir. It is as follows:

		Total..						11,110 feet or 2.10 miles.		

5432 Q. This sample which you have presented shows a total of 11,110 feet, or something over two miles?

A. 2.10 miles.

Q. Is it the fact that entire blocks were left out of the mains?

A. Yes, sir, not entire blocks only, but in some cases the entire width of the page, for instance, such as 1206-feet, 1400-feet, 1569-feet.

Q. Now, you say there are also numerous cases where the length is given by Professor Marks as shorter than actually shown on the maps, even if measured by their own scale?

A. Yes, sir.

Q. Have you illustrations of these errors that you have discovered?

Mr. Burr: Of course, I expect to be furnished with copies of these statements for the purpose of enabling me to cross-examine.

Mr. Mathewson: You shall have them before I get through, before they are printed; and you can proceed with your cross-examination from them right here.

Q. Will you present this for the record?

A. Yes, sir. It is as follows:

(Here follows table marked pp. 5433 and 5434.)

Total Difference 6166.90

5435 Q. Now, the differences run from the fraction of a foot up to 1,684 feet, so far as you have shown on this statement you have just read in evidence?

A. Not a fraction of a foot in any case. I did not look for that at all. Oh, yes, in one case it was .93.

Q. .93 of a foot, yes, and up to 1,684 feet in one case?

A. Yes, sir.

Q. And the total of this illustration is 6,166.9 feet, or something over a mile, isn't it?

A. Yes, sir.

Q. In some cases the mains tie to transverse lines and there is no accurate statement on the map or any statement of the distance of the mains from the curbs?

A. No, sir.

Q. Has that resulted in an inaccuracy of main distances in such instances where you have examined?

A. Yes; because the curb line is not even shown on the map. It is only the house line that is shown.

Q. Have you a table or an illustration of some of these differences?

A. I have a table of a few of the absolutely thousands of cases of that kind—every street corner where a main stops.

Q. That is what I mean as an illustration; and this schedule which you now present, is that an illustration of that character of error?

A. Yes, sir.

Q. And this particular sheet shows a difference of 813 feet, due to these circumstances?

A. Yes, sir. The schedule is as follows:

Measurements Scaled from Insurance Volume Maps, Showing Inaccuracy of Main Distances where Ends Tie to Transverse Lines.

Main on—	From—	To—	Volume Scale.	Key Book.	Difference in Feet.	Affects Mains.	Total ft. Affected.

							813

The above cases are taken from the first part of Volume Eight.

PAGE BOUND VERTICAL IN BOOK

5437 Q. Now, you have also said that there are a number of instances, so far as your examination goes, where the sizes as given by Professor Marks are incorrect?

A. Yes, sir.

Q. Thirty-inch main is stated where it should be thirty-six-inch main, and so forth?

A. Yes, sir.

Q. Have you an illustration of those errors?

A. Yes, sir. The illustration is as follows:

5438 & 5439

Some Errors in Sizes of Mains in Prof. Marks' Exhibits.

PAGE BOUND VERTICAL IN BOOK

5440 Q. All these errors here and those to which I have previously called your attention appear on the face of the maps themselves?

A. They do, sir.

Q. The dimensions of the mains here appear on the map correctly?

A. Yes, sir.

Q. They have been incorrectly taken off by Mr. Marks?

A. Yes, sir.

Q. Have you also prepared a table illustrating some of the other errors to which you have testified as differences between the detailed schedules and the summary sheets of Professor Marks' exhibits?

A. Yes, sir.

Q. And mains appearing on the detailed schedule have been omitted from the summary sheets?

A. Yes, sir.

Q. And mains appearing in detail of a certain size have been put down on the summary sheet under a smaller size?

A. Yes, sir.

Q. And mains appearing on detail schedules as disused where the main described is shown on the map as being in use?

A. Yes, sir.

Q. And mains appearing in a column of the summary sheet which has not been totaled, and therefore not included in the totals given on page 4605?

A. Yes, sir.

Q. Is this the result of the examination of the entire number of schedules, or merely an illustration?

A. Merely illustrations all the way through. We have not gone through the whole thing.

Q. Do you desire to spread that on the record as an illustration of those discrepancies?

A. Yes, sir. The illustration is as follows:

5441 SOME OF THE DISCREPANCIES EXISTING BETWEEN THE DETAILED SCHEDULES AND THE SUMMARY SHEETS OF PROF. MARKS' EXHIBITS.

(Errors in length.)

Vol. No.	Map No.	Schedule No.	Schedule gives—	Summary gives—	Error. Against company.
1	8	10	71.41 ft. 3 in.	21.41 ft. 3 in.........	50.00 ft.

11	240	163	1302.07	30	1502.07	24

5442 *Mains Appearing on Detail Schedules as Disused, Where the Main Described is Shown on the Map as Being in Use.*

Vol. No.	Map No.	Schedule No.	Schedule gives—
7	182	120	1316.25 ft. 20 in. disused........... 1316.25 ft.

Mains Appearing in a Column of the Summary Sheet which have not Been Totaled and Therefore Not Included in the Totals Given on p. 4605.

	Entries on summary sheet not included in the total amount to—		
Summary sheet No.	Length.	Size.	Error. Against company.
7 A	5975.66 ft.	10 in....................................	5975.66 ft.

Volume No.	Schedule No.
7	125

The entries credited to Map 142 on the Summary Sheet, should really be credited to Map 141, as proved by checking from the Detail Schedule. The mains appearing on the Detail Schedule—and belonging to Map 142 do not appear on the Summary at all. This is an error against the Company of:

3569.63 ft. of 6 in.
1742.40 ft. " 8 in.
50.51 ft. " 12 in.
1352.98 ft. " 30 in.

6715.52 ft.................................... 6715.52 ft.

Volume No.	Map No.	Schedule No.
4	77	82

The active 4-inch main is entered but not totaled on the detailed schedule. It amounts to 2,087 feet (about).

The 4-inch disused main is 987.86 ft. and this is shown on the summary sheet as active.............. .... 1,097.14 ft.

5443

Volume No.	Map No.	Schedule No.
5	90	92

The active 3-inch main appears on the detailed schedule as 1135.49 ft., and the disused 3-inch main as 769.80 ft. The disused length is shown on the summary as the active main.. 367.69 ft.

The main mileage given on page 4605 of the testimony does not agree with the totals as taken from the summary sheets, as shown by the following table:

Size of main.	Total length as given in tesmony p. 4604.	Total length as taken from the summary sheets and added.	Difference.	
2 inch......	3,969.60	3,969.60		
3 “	138,057.22	138,057.24	.02

Total error against the Company in the above noted cases........................... 43,745.26 feet.

5444 Q. And the errors shown on this sheet, which you have just presented, amount in total, do they not, to 43,745.26 feet, or something like eight miles, isn't it, or a little over?

A. Yes, sir; 43,745.26 feet.

Q. Now, you have another table, haven't you, relating to this subject?

A. Yes.

Q. Will you state what it is? What is this first table you have before you?

A. It is a summary of the errors made by Mr. Marks in giving the length of the mains.

Q. As to the mains, so far as you examined?

A. Yes, sir.

By the MASTER:

Q. You mean a recapitulation of the statements already made here?

A. Yes, sir: The summary is as follows:

5445 The mains, active and disused, as given by Mr. Simpson, at Oct. 31st, 1905, amount to a total of			4,344,849.00

Mains scaled from Maps by Prof. Marks.

Active	3,862,282.90		
Adding disused at Oct. 31st, 1905	147,158.00		
		4,009,440.90	

Adding for

Maps 118, 119, 120, 121, 122—five in all—not scaled by Prof. Marks (see sheet)		128,051.00	
Some of the mains omitted from Prof. Marks' exhibits (see sheet)		11,110.00	
Some of the mains incorrectly scaled by Prof. Marks (see sheet)		6,166.90	
Prof. Marks allows for the Bronx (see page 4605)		29,111.00	
Some of the errors noted in comparing the detail schedules with summary sheets (see list)		43,745.26	
			4,227,625.06
Leaving, according to Prof. Marks' statement, and not including other uncorrected errors, a difference of...			117,223.94

—which is equal only to 2.69 per cent.

Q. You now produce another sheet?
A. Yes, sir. It is as follows:

5446 The mains, active and disused, as given by Mr. Simpson, at Oct. 31st, 1905, amount to a total of			4,092,913.36

Mains scaled from Maps by Prof. Marks.

Active	3,862,282.90		
Disused	230,630 40		
		4,092,913.30	

Adding for

Maps, 118, 119, 120, 121, 122 (the pages omitted) 5 in all, not scaled by Prof. Marks. (See sheet)		128,051.00	
Some of the mains omitted from Prof. Marks' exhibits. (See sheet)		11,110.00	
Some of the mains incorrectly scaled by Prof. Marks. (See sheet)		6,166.90	
Prof. Marks allows for the Bronx. (See page 4605)		29,111.00	

(Prof. Marks' total did not include the Bronx mains, which are nearly six miles.)		
Some of the errors noted in comparing the detail schedules with the summary sheet (see list)......................	43,745.26	
		4,311,097.46
Leaving, according to Prof. Marks' statement, and not including other uncorrected errors, a difference of...		33,751.54

—which is equal to only 77/100 of 1 per cent.

Q. How does that differ from the table which has been placed on the record just before this last one?

5447 A. On this second sheet in place of the 230,630.04 feet of disused mains, I have taken only the disused mains that we are carrying on our books, amounting to 147,158.00.

Q. That is to say, in place of the disused mains given by Professor Marks, you have reduced that to the amount of disused mains we actually have on our books?

A. Yes. That brings the difference down to 117,223.94 or 2.69 per cent.

Q. That, of course, would increase the difference if you cut out a portion of the mains?

A. Yes.

Q. Leaving the active mains in each case as scaled by Mr. Marks and as they appear upon our records for the purpose of comparison?

A. Yes, sir.

Q. How near did Mr. Marks state to you that he thought he could come on scaling the maps to the exact mileage of the mains?

A. His exact words were, "I think I can come within 5 per cent. of it;" and my reply was, "You cannot come within 15 per cent."

Q. Isn't it the fact that since November 17th, 1906, when Mr. Marks made his examination, or began it, that mains have been added to the maps which were on the records of the company before that, but which had not been transferred to the maps?

A. Yes, sir.

Q. And does this schedule which you now present show what those were?

A. Yes, it does, and it is as follows:

5448 & 5449

Memo. of Mains Entered on Insurance Volume Maps Since November 17th, 1906.

Size.	Side.	Street or Avenue.	From—	To—	Feet. No. of.	Volume Entered in.	Vol-ume.	Map.

					4,772			

5450 Q. How many feet are there?
A. 4,472 feet.

By the **Master**:

Q. Those were not taken into account by you in making your examination?
A. No, sir.

Mr. **Page**: They were taken in by him when he gave his 822 miles.

The **Witness**: Certainly not. This is since I gave my testimony.

Mr. **Mathewson**: I am merely illustrating that the maps would not at any time exactly coincide with the record of the books, because there are mains in the books which have not been transferred to the maps, probably at all times, more or less.

Mr. **Burr**: I understand this is merely offered for the purpose of comparison. It is not now claimed that they have more miles of mains?

Mr. **Mathewson**: No. We are simply claiming the mileage of mains which appeared on October 31st, 1905, as Mr. Simpson has testified, but of course your measurements made last November must represent some little different mileage from that, undoubtedly.

Mr. **Burr**: That is an assumption of yours, isn't it?

Mr. **Mathewson**: It must be. I think it is a fair one, though. But as you attempted to attack the 822 miles we are meeting it in that spirit.

Mr. **Page**: Then I understand that these four thousand feet that you put in now were things that were on the books of the
5451 company and entered into the 822 miles, but had not been transferred to the maps.

The **Witness**: No, sir.

Mr. **Mathewson**: No, Senator.

Mr. **Page**: Then do you claim since October 31st that you have laid those additional mains which had not been transferred to the maps when Mr. Marks made his measurements, but have since been transferred to the maps? If that is so why should they enter into the calculation at all.

Mr. **Mathewson**: Yes, I think so. They do not enter into the calculation. All we are claiming is 822 miles which we had on October 31st, 1905, not including mains put in since, because we cannot follow it up to the very date, else we would never get through with this action.

Mr. **Page**: What are these mains added since? What does that show? If it had been added since and had not been put on the maps, or been added to the books since and added to the map since——

Mr. **Mathewson**: You do not understand the case, Senator. On the 17th of November when Professor Marks made his examination there were certain mains which had been laid and which appeared in the records of the Engineering Department. Those mains are not placed upon the maps until after they are laid and after they appear in the Engineering Department records, so you would always probably find by the company's records a few more mains than appeared on the maps, because they are not transferred to the maps for perhaps a week or a month after they appear in the record of the company. It is done at convenience by draughtsmen. That 5452 is the point. It is merely to illustrate the impossibility of the kind of a comparison, even from that standpoint, which Mr. Marks seeks to make in checking our book record of mains.

Mr. PAGE: Illustrations are all right, but testimony that certain additions were made or existed at that time, it seems to me, should be more comprehensive.

Mr. MATHEWSON: We will put it in, if you want it on the record.

By Mr. MATHEWSON:

Q. That is a correct statement, is it, Mr. Simpson?

A. It is a statement of mains entered on our maps since Professor Marks made his measurement, that is all it is.

Q. But those mains were in your books when Professor Marks made his measurements, were they not?

A. No, sir.

Q. None of them?

A. None of them. This is an alteration of the map since Professor Marks made his measurement.

Mr. MATHEWSON: Then in that view I do not see that it is material. It is not material for the purposes of a comparison.

Q. Isn't it a fact that there are frequently mains on the records of the company which have not yet been transferred to the maps?

A. There isn't a — where you wouldn't find them.

Q. So that an examination of the map, even if correct as to scale and everything else, would not show exactly the same figures as the books, as a rule? It would show a smaller figure, wouldn't it?

A. It might neither show it in any. These reports are sent in and it does not mean to say immediately they are received 5453 they are entered in the book or on the maps from the books. The draughtsman who enters them up might have important work on hand for a week before he could enter them and in that case they would not be on the maps, but the record would be in the office.

Q. But you would know what they were?

A. Yes, and the amount of mains we had at that time would be the book records plus the reports sent in and not entered on the books, if there were any.

Q. Now, Mr. Marks presented the schedule showing his estimate of cost of original installation of pipes according to the size?

A. Yes, sir.

Q. And he stated that in cases where mains were laid by contract that 15 per cent. should be allowed beyond the rate where they were laid by the company. Have you prepared a schedule showing the value of the mains, original installation, based upon Dr. Marks' figures, even deducting the disused mains and taking only the 795 miles of active mains?

A. Yes, sir.

Q. Is that the computation which you have in your hand?

A. Yes, sir. It is as follows:

5454 ESTIMATE OF INSTALLATION VALUE—OCTOBER 31st, 1905.

(Based on mileage at that date at Prof. Marks' prices.)

Size.	No. of feet.	Price per foot.	Amount.	
1½″	1,407			
2″	4,365	$ .925	4,037.63	
3″	222,741	1.07	238,332.87	
4″	557,469	1.22	680,112.18	
5″	2,799	1.42	3,974.58	
6″	2,129,088	1.625	3,459,768.00	
8″	528,040	2.095	1,106,243.80	
10″	71,286	2.41	171,799.26	
12″	321,536	2.937	944,351.23	
16″	98,901	3.78	373,845.78	
18″	29,633	4.28	126,829.24	
20″	178,803	4.757	850,565.87	
24″	45,956	5.645	259,421.62	
30″	131,583	7.71	1,014,504.93	
36″	22,242	9.695	215,636.19	
				$9,449,423.18

Deducting the mains disused at October 31st, 1905, calculated on Prof. Marks' prices as follows:

Size.	No. of feet.	Price per foot.	Amount.	
2″	125	.925	115.63	
3″	53,444	1.07	57,185.08	
4″	49,388	1.22	60,253.36	
5″	38,151	1.625	61,995.37	
6″	3,017	2.095	6,320.62	
10″	738	2.41	1,778.58	
12″	265	2.937	778.30	
20″	1,813	4.757	8,624.44	
24″	34	5.645	191.93	
30″	183	7.71	1,410.93	
				198,654.24
				$9,250,768.94

To which is added 15 per cent. of the cost of those mains laid by Contract....................................	433,753.53
	$9,684,522.47

The books of the Company carry this cost, including also the 27.871 miles of main disused but not abandoned, at only $7,852,151.03.

5455

MAINS LAID BY CONTRACT.

(Taken over at Consolidation.)

Size.	Feet.	Price.	Value.	
1½″	1,275			
2″	2,844	$ .925	$2,630.70

Total	$2,891,690.22
15 per cent. of same	433,753.53

NOTE.—Based on mileage at Oct. 31st, 1905.

Prof. Marks' prices.

5456 Mr. PAGE: Is this a computation made up from Dr. Marks' testimony?

Mr. MATHEWSON: No, not entirely. It attacks his testimony as to certain elements, the cost of laying a main, and applies it to the 795 miles of active main, and also makes the addition for the mains laid by contract where the cost would be 15 per cent. more, and Mr. Simpson, I shall ask in a moment as to how that is made up, the contract part.

Mr. PAGE: Isn't that a matter for a brief, instead of testimony?

Mr. MATHEWSON: No, I don't think so. I think it is fair testimony.

Mr. Burr: It is merely a computation.

Mr. Mathewson: No, it is more than a computation.

Q. You know what portions of the mains of the company were laid by contract, do you?

A. I do.

Q. And Mr. Marks' testimony was that 15 per cent. should be allowed additional where mains were laid by contract to the figures that he gave?

A. Well, his testimony was that you must deduct 15 per cent. from the prices he gave because the mains were not laid by contract.

Q. Were some of the mains of the company laid by contract?

A. Yes, sir.

Q. To your certain knowledge?

A. Yes, sir.

Q. And have you included in this statement the mains that were laid by contract, by the figures which Dr. Marks gave for mains laid by contract?

A. Yes, sir.

Q. And the other mains, have you included at the figure which Dr. Marks gave for mains laid by the company and not by contract?

A. Yes, sir.

5457 Q. Isn't it a fact that some of the mains were laid by contract beyond those that you have included at contract prices in this schedule?

A. Yes, sir.

Q. Do you know exactly how much they were?

A. I do not.

Q. So you have not attempted to include or estimate?

A. I have not attempted to include those.

By Mr. Page:

Q. Where you state mains have been laid by contract, is the amount that is entered upon this schedule the exact amount of the contract price as paid by the company?

A. No, sir. I have taken Professor Marks' price here. You see it shows on the top.

Mr. Page: I object to this then. It does not seem to me as relevant or material in any way.

The Master: I allowed some testimony the other day for the defendant which was very much of the same general character as this, and therefore I will now allow this testimony.

Mr. Page: Irrespective of that point, if they wish to attack his estimate of contract price, why not do it by showing what the contract prices were?

Mr. Mathewson: We are not attacking them in any way.

Mr. Page: I would like to get a few facts and not have only an estimate as has been given so far as to the value of mains.

Mr. Mathewson: You seem to be trying to protect the City's witness.

Mr. Page: No, I am not. I am trying to get the evidence in in some shape where it will be of value.

Mr. MATHEWSON: Mr. Marks testified as to the cost of installation of different sizes of pipes. We have taken his own schedule and included as contract mains only the mains that we knew 5458 were laid by contract, and in that case we have included Mr. Marks' own figures for the amount where they are laid by contract, and we are showing upon his own figures that the cost of the mains is what they appear in this schedule.

Mr. PAGE: We now have in the case three different valuations of the same mains, given by this witness, for different purposes prepared. Now, if we are going to have something accurate as to contract price and laying mains, to rebut Mr. Marks, it seems to me, it should be the actual cost price, if you want to show that his price was wrong in any way.

The MASTER: I said I would admit it as I had admitted other similar testimony.

Mr. PAGE: Exception.

By Mr. MATHEWSON:

Q. And according to those figures of Mr. Marks, what would be the cost of original installation of these 795 miles of active mains?

A. $9,684,522.47.

Q. That is nearly two million dollars more, is it not, than the $7,852,151.03 at which the company carries on its books the 795 miles of active mains, plus 27.871 miles of disused mains?

A. Yes, sir.

Q. Referring to your map measurements again, on the map the mains are made to run in a straight line to appearances, are they not?

A. Yes, sir.

Q. Do they, in fact, run in straight lines through the blocks?

A. We try to run them in straight lines wherever we can.

Q. Is that in every case possible?

A. No, sir.

Q. You have to curve around man-holes and one obstruction or another?

A. Yes, sir.

Q. In every such case does it not give a greater length of main than would appear from the straight line on the map?

A. Yes, sir.

5459 Q. Even if the scale of the map were correct?

A. Yes, sir.

Q. Is it occasionally the case that they turn to go around man-holes, or, rather, thousands of such cases?

A. Without any question there are thousands of such cases to-day in New York.

Q. And is the construction around a man-hole more or less expensive than the construction of straight pipe to that same extent?

A. It is at least 50 per cent. more expensive.

Q. Did you find that any allowance for such things as that was made by Mr. Marks in his figures or schedules?

A. No, sir.

Q. Again, as to the disused mains on the map not abandoned, where a main is disconnected, it is indicated on the map, isn't it, by a scratching out?

A. By an erasure.

Q. The main is still there, isn't it?

A. In the case of those gaps, yes, sir.

Q. And the erasure merely indicates that the connection has been severed?

A. That the main is disconnected at that point.

Q. Did you observe whether, in measur-ng the maps, Mr. Marks or his assistants excluded these places where these erasures were?

A. I did, sir.

Q. As a matter of fact, mains are there, are they not?

A. Yes, sir.

Q. Did you yourself see the maps and measurements so that you know?

A. I saw Professor Marks' measurements.

Q. Now, about what proportions of these measurements of Mr. Marks' and these schedules from Exhibit 92 to Exhibit 103 did you examine in testing their accuracy?

A. Well, we went over between 10 and 20 per cent. of the maps in the volumes.

Q. You haven't been over then 20 per cent. of the schedules for the purposes of comparison?

5460 A. Certainly not more than twenty, and I don't think 20 per cent. even.

Q. Supposing the same ratio of error continued throughout the balance of the schedules as you discovered in the 20 per cent. you examined, how would that bring out the totals of mains as compared with the actual mileage of the company?

A. I think Professor Marks would give us more mileage than we actually claim.

Q. Fifty or one hundred miles, in the same ratio?

A. Yes, sir.

Mr. Page: What do you complain of, if he gives you more mileage?

Mr. Mathewson: We do not. We are pleased with the whole situation ourselves.

At 12:55 p. m. a recess was declared for lunch until 2:15 p. m.

5461 After Recess.

Colin C. Simpson resumed.

By Mr. Mathewson:

Q. In referring to these valuations which have been the subject of attack by the defendants in their testimony, is the price of pipe to-day higher or lower than it was when you made the computations which were attacked, that is in 1906?

A. It is a great deal higher.

Q. And if the mains were to be computed on the cost of reproduction to-day it would raise your $12,656,000 how much, perhaps?

Mr. **Kirby**: I object to this, Your Honor.
Mr. **Mathewson**: Well, all right.

Q. It would raise it on the basis of present prices, would it not?
A. At least 15 per cent.

Mr. **Kirby**: And next year it might be 20 per cent. lower?
Mr. **Mathewson**: Precisely. I am merely showing that the tendency of materials is upwards.

Mr. **Kirby**: And the tendency of mechanical devices is downwards, which equalizes the cost.

Q. Now, having disposed of Mr. Marks, or, rather, his testimony, let us look at Mr. Edgerton's testimony for a few moments. The testimony to which I am directing particular attention begins at page 4,033, with regard to the depth of mains, pages 4,033 to 4,035. Mr. Edgerton says that he has found a shallow main a preventive of trouble in services rather than adding to it. Have you had any such experience as that a shallow main prevents trouble with services?

A. I have had the opposite experience.

5462 Q. Did you ever hear the theory advanced until Mr. Edgerton gave it?

A. Never.

Q. What is the experience of the company with its services in the City of New York in cold weather?

A. That the shallower a service is, the more trouble we will have from it, and the deeper a service is, the less trouble we will have from it.

Q. Was the winter of 1903-'04 a particularly severe winter, do you remember?

A. 1903-'04? No, I do not remember. 1904-'05 I remember.

Q. Was there not a severe winter two or three years ago?

A. 1904-'05 was a very severe winter.

Q. Did you find it necessary in many cases during that winter to take up the pavement and thaw up the ground around your shallow services?

A. Yes, sir.

Q. Where the services were deeper, did you have as much trouble?

A. No, sir.

Q. What do you say to Mr. Edgerton's statement that frost does not interfere with service pipes when the mains are shallow, or does not so seriously affect them?

A. Well, I do not agree with him at all.

Q. Do you know of any city where it is the custom to lay shallow service pipes in a high altitude, in order to take advantage of the cold, so to speak?

A. I never heard of the theory before. I have heard the opposite.

Q. In regard to lamp risers, what is your experience as to the number of lamps frozen out in cold weather in New York?

A. It has been common in severe winters in New York during a prolonged cold snap to have absolutely thousands of lamps out in one night.

Q. And is it necessary to keep a large gang of men continuously at work thawing out these frozen stand pipes?

A. Not only a large gang, but large gangs of men in every district.

5463 Q. By stand pipes you refer to risers, as Mr. Edgerton calls them?

A. Risers.

Q. What is the cover at which the mains are laid in Manhattan, if possible?

A. They average, the Consolidated mains average a cover of 2 feet 9 inches.

Q. And how deep do you lay them where you can do so?

A. From four feet to three feet six inches; the minimum I allow when it is possible to lay them at that depth is three feet six inches.

Q. Is it possible in the island of Manhattan to adhere to any fixed rule as to depth?

A. No, sir.

Q. Why not?

A. On account of the multitude of sub-surface structures.

Q. In this very severe winter of two or three years ago what was the condition of the ground as to depth of freezing as compared with the normal year?

A. The frost that winter reached in places four feet three inches deep, which is deeper than I have ever known it in Manhattan before in my twenty-five years' experience.

Q. And the average winter is how deep?

A. Last winter it did not reach twelve inches.

Q. But the average is not over two feet six inches, is it?

A. It is generally a very severe winter when it reaches three feet in depth.

Q. So that in the average winter the mains are not frozen, that is to say, the frost does not extend down more than to the top of the mains, does it?

A. No, sir.

Q. Isn't it true that during this severe winter of two or three years ago the pipes of the company were frozen throughout substantially the whole winter, that is the frost below the pipes and the pipes surrounded by frozen earth?

A. There was, I should say, at least 80 per cent., between 70 and 80 per cent. of our mains were surrounded by frozen earth, mains and services.

5464 Q. Now, Mr. Simpson, in this severe winter, when your mains were frozen up, according to Mr. Edgerton's theory, as I understand it, that that should produce some precipitation of moisture so you would have less trouble with the services than usual, what is the fact? Did you have less trouble during that winter or more trouble than usual with your services?

A. I don't quite understand the question, Mr. Mathewson.

Q. (Question read.) In other words, did you have more trouble or less trouble with your services the year that your mains were frozen up with frost four feet deep, or did you have less trouble than you do when the mains are not frozen up?

A. No, sir, the deeper the frost got the more trouble we had, and the climax came when the frost got down to four feet three inches deep, the most trouble of all.

Q. Then what was the condition as to your services?

A. Then they were freezing by the thousand.

Q. And you did not find the fact that at the mains were embedded in frozen earth was helping your services at all?

A. Not one bit.

Q. Do you know at what depth the mains in the City of Montreal were to be placed according to Mr. Bemis' estimate?

A. I know from my own knowledge; I have been out there and have seen them.

Q. Well, what?

A. They do not allow any main to be laid less than four feet to four feet six inches, and where they can get deeper they do it; when they can get to six feet they do it.

Q. On account of the temperature?

A. On account of the frost in the ground.

Q. Now, Mr. Edgerton, at page 4037 says in general that he has followed the cost of digging trenches in which to lay pipes, and the refilling of the same in detail. Does his description or theory apply, or can it apply, to pipes in large places and under New York conditions?

A. No, sir, it cannot.

5465 Q. Would a situation that would apply in Danbury or Asheville apply in New York City at all?

A. It might in some instances; I don't know——

Q. As a general proposition?

A. As a general proposition it would certainly not.

Mr. Kirby: The witness is not familiar with the peculiar conditions of Danbury, I suppose?

Mr. Mathewson: Well, he is with small places in general.

Q. In laying such large pipes as this company is laying, thirty-inch, thirty-six-inch and forty-eight-inch, you require, do you not, derrick men and large derricks and other material that you do not require in laying smaller mains?

A. Yes, sir.

Q. Now, Mr. Edgerton in his estimate of pipe referred to the cost of pipe laid beside the ditch. Are you permitted in New York City to lay your pipe beside the ditch while you are opening the ditch on one side of the street?

A. We are not allowed to cart any pipe into the street until we have a permit, and our permit is issued on the condition that we commence work within twenty-four hours after the receipt of the permit.

Q. Where do you have to place your pipe when you open a trench on one side of the street?

A. On the opposite side of the street.

Q. And it cannot, therefore, be delivered at the trench, but has to be rolled across the street when you get ready for it, is that right?

A. Yes, sir.

Q. Are you permitted to open a trench of unlimited length in New York City?

A. No, sir; we are limited to six hundred feet.

Q. That is less than three blocks.

A. Two blocks. Two blocks is five hundred and twenty feet.

Q. Are you entitled to open more trench until that is filled?

A. No, sir.

5466 Q. Mr. Edgerton said he had made no allowance, so I understood it, for bridging. What is true as to bridging in laying mains here?

A. Mr. Edgerton did not mention anything about bridging.

Q. Very good. Will you mention something about it?

A. We are required to keep open every street we cross, and in running a line up an avenue we have a street every two hundred and sixty feet, and to keep that street open we naturally have got to bridge, bridge for both wagon traffic and for passengers.

Q. Did you find any allowance for bridging in Mr. Edgerton's estimates?

A. Not one cent.

Q. Now, in taking the length of pipe, Mr. Edgerton divides the length of three and four-inch pipe between what he calls old pipe of a certain weight and new pipe of a certain other weight. What is the fact as to that small pipe; is that new or are you laying that small pipe now?

A. I have been laying pipe for the Consolidated Gas Company for 25 years, and I have never used any other weight than what I have quoted in my testimony.

Q. But as to the size of pipe, are you putting in three, four or five-inch pipe now?

A. No, the only three or four-inch pipe I have laid in my time has been—it might possibly be called mains, but they are short lines down an alley or a courtyard, where there are three or four houses in the court or alley, a blind alley, we would run in place of a service pipe to supply these houses, and naturally a pipe that supplies four or five houses is called a main and not a service.

Q. But outside of that have you laid anything less than six-inch pipes since 1889?

A. No, sir; absolutely none.

Q. So that small pipes would all be old pipes?

A. All have been laid prior to my time.

5467 Q. Of course, it does not follow from that that the company is not using and cannot use three, four and five-inch pipe where it exists, to send gas through it?

A. Not at all.

Q. Of the thirty-inch pipe Mr. Edgerton assumed 60,000 feet to be old and 71,583 feet to be new, in estimating weights. As a matter of fact how much of that pipe was old, old before consolidation?

A. I can not give you offhand the only thirty-inch pipe that was in existence before consolidation.

Q. Just look and see the total. I do not care about the detail.

Mr. Kirby: What do you mean by the old and new?

Mr. Mathewson: I am assuming Mr. Edgerton's estimate. He said he estimated a certain amount was laid before 1884, when the lighter weights obtained.

Mr. Kirby: You mean lighter weights used prior to that date?

Mr. Mathewson: Exactly so.

The Witness: I can tell you offhand what thirty-inch main was laid before consolidation. The only thirty-inch was a thirty-inch main that ran from 109th Street and Second Avenue to Sixtieth Street and Second Avenue, through Sixtieth Street to Lexington Avenue; outside of that the Municipal Company had one on Forty-sixth Street which ran from the Municipal Works at Forty-fifth Street and Eleventh Avenue to Forty-sixth Street and Third Avenue.

Q. Well, it is not over 20,000 feet or such a matter?

A. It is less than 20,000 feet all told.

Q. Of old thirty-inch pipe?

A. Of old thirty-inch pipe.

Q. Of the thirty-six-inch pipe Mr. Edgerton gave 11,000
5468 feet as old and 11,242 feet as new. Is it not a fact that every
inch of that has been laid within the past three years?

A. A thirty-six-inch gas main was not known in New York up to three years ago. We laid the first one which was ever laid in New York.

Q. Mr. Edgerton has given in his computation or has assumed certain weights for pipe. Do you find that the weights for pipe which he assumed correspond with the actual weights of pipe that the company has employed?

A. In hardly a single instance does he agree with us at all.

Q. Have you prepared a schedule showing the size and weight of the pipe used in the Consolidated Gas Company?

A. I have.

Q. As compared with Mr. Edgerton's figures?

A. Yes. Shall I call them off?

Q. I do not think it is necessary. Supposing you say they are as follows:

The Witness: They are as follows:

Weights Per Foot of Cast Iron Pipe.

Size.	Con. Gas. Co. Includes hub.	Edgerton's Weights. Old.	New.
3-in.	13	11	12
4-in.	19	17	18
5-in.	0	0	0
6-in.	32	25	30
8-in.	44	38	44
10-in.	57	50	55
12-in.	74	58	72
16-in.	114	100	110
18-in.	136	120	130
20-in.	160	140	150
24-in.	215	185	200
30-in.	311	270	260
36-in.	425	360	360
48-in.	660	0	0

5469 Q. In other words, are the weights which Mr. Edgerton assumed in general smaller or larger than the weights the company has in the ground?

A. In practically every case they are a great deal lighter.

Mr. Kirby: So I may understand this exactly, are these weights of Consolidated Gas Company, including hub?

The Witness: Yes; including the hub.

Q. For what pipes are they, old or new?

A. There is no old and new. We make no distinction. We have used the same weight for twenty-five years. There is no such thing as old and new.

Q. I see you have opposite the forty-eight inch main 660 pounds for the Consolidated Company weight and zero for Mr. Edgerton's weight. Did he give any weight for that?

A. He did not give any weight for that. I may say we had no forty-eight inch mains in the ground as of October 31, 1905.

Q. Now, of the six-inch pipe alone, practically half of the company's mains are of that size, are they not?

A. Yes, sir.

Q. And what weight does Mr. Edgerton give for six-inch pipes?

A. He gives for old twenty-five pounds per foot, and for new thirty pounds per foot.

Q. Whereas the weight which company actually uses is what?

A. Thirty-two pounds per foot.

Q. And if you take the weight given by him of the new mains it shows a difference of two pounds, and that minimum difference would amount to more than 400——

A. 4,000,000 pounds.

Q. To more than 4,000,000 pounds on the six-inch mains?

A. Yes sir; four and one-half million pounds, about.

Q. Now, Mr. Edgerton suggested that the reason for the use of
heavier pipe, than he assumed was because pipe had become
5470 cheaper since it sold at \$60, or \$70, or \$80, prior to consolida-
tion. You say that there has been no change in weights?

A. In weights?

Q. Of pipe.

A. None.

Q. And what governs the weight of pipe which you require to put in the ground, the price of traffic conditions?

A. The weight is governed by external conditions that have to be contended with.

Q. Traffic conditions?

A. Traffic conditions, disturbance of the soil; as a matter of fact, with the things we have to contend with. If it was only a matter of internal conditions we could get along with stove pipe; it would be plenty heavy enough for our pressure.

Q. But, as a matter of fact, traffic conditions are burdensome in New York, heavy traffic?

A. Yes, sir. As a proof of that, in numerous cases we use thirty-six and forty-eight inch mains the same weight as water pipe is used, and I know of numerous instances in New York where thirty-six inch and forty-eight inch Croton mains have been broken, not by internal conditions, because the pipe is tested anywhere from 250 to 300 pounds to the square inch, and they never have any more than seventy pounds, and in every case it has been due to external conditions.

Q. Now let me ask you, Mr. Simpson, whether the company uses any heavier pipe than your experience and knowledge has taught you is necessary to meet these conditions in New York City?

A. It certainly does not. It uses pipe—the weight of pipe we are using to-day results from numerous conferences between the Chief Engineer, Mr. Bradley, other engineers in the gas business in New York City, and other men taking care of gas mains.

Q. From your knowledge of New York conditions and New York
traffic and the exterior conditions generally, would you con-
5471 sider it safe or advisable to put in lighter pipes than the com-
pany is now employing?

A. I would not consider it safe at all.

Q. Now, Mr. Edgerton at page 4,042 of his testimony, in explaining some discrepancies, as I understand it, stated he figured his calculations on the short ton at $28.90 and that you figured on the long ton at the same price. Is that correct?

A. No, sir.

Q. What is the fact?

A. I figured on a short ton in every case. In no part of my testimony did I mention the long ton at all.

Q. Have you prepared and have you here a statement of the weight of the Consolidated Gas Company's pipe in the ground by size, mileage and net tons?

A. Yes, sir.

Q. The total is how much?

A. 122,018.4 net tons or short tons. It is as follows:

Size.	No. of feet main.	No. of feet pipe.	Weight per foot.	Net tons
1½-in	1,407	1,436	7 lbs.	5.0
2-in.	4,365	4,456	10 lbs.	22.3
3-in.	222,741	228,866	13 lbs.	1,487.6
4-in.	557,469	572,799	19 lbs.	5,441.5
5-in.	1,799	1,849	26 lbs.	24.0
6-in.	2,129,088	187,638	32 lbs.	35,002.2
8-in.	528,040	542,561	44 lbs.	11,936.3
10-in.	71,286	73,246	57 lbs.	2,087.5
12-in.	321,536	330,378	74 lbs.	12,223.9
16-in.	98,901	101,621	114 lbs.	5,792.4
18-in.	29,633	30,448	136 lbs.	2,070.5
20-in.	178,803	184,391	160 lbs.	14,751.2
24-in.	45,926	47,551	215 lbs.	5,111.7
30-in.	131,583	136,152	311 lbs.	21,171.6
36-in.	22,242	23,015	425 lbs.	4,890.7
Totals..	4,344,849	4,466,407		122,018.4

5472 Q. And in your computation you have figured on the short ton delivered to the dock, plus any cost of handling and stacking, have you?

A. And delivering to the work—no, I beg pardon, not on the value of the pipe. The value of the pipe I have figured the cost delivered on the dock and the carting to the yard and the stacking in the yard.

Q. The cost of the pipe to you before you send it out to the ditch?

A. Before it is sent out to the ditch?

Q. Have you prepared a schedule showing the extent of the error of Mr. Edgerton as to the weight of pipe?

A. Yes, sir.

Q. Comparing each size?

A. Yes, sir.

Q. And is this it (handing paper)?

A. Yes, sir.

Q. The first is the summary and the second paper is the detail?

A. Yes, sir. It is as follows:

5473 *Difference in Weights of Pipe as Used by Consolidated Gas Company and as Calculated by H. H. Edgerton.*

Size.	Total weight as calculated by Mr. Edgerton.	Total Weight Consolidated Gas Co. Standard.	Difference.
1½			
2	74,820	100,273	25,452
5			
3	2,572,892	2,895,633	322,741
4	9,784,442	10,591,911	807,469
6	58,870,000	68,130,816	9,260,816
8	21,732,000	23,233,760	1,501,760
10	3,770,730	4,063,302	292,572
12	21,050,592	23,793,664	2,743,072
16	10,429,000	11,274,714	845,714
18	3,732,290	4,030,088	297,798
20	26,020,450	28,608,480	2,588,030
24	8,891,200	9,880,540	989,340
30	34,811,580	40,922,313	6,110,733
36	8,007,120	9,452,850	1,445,730
	209,747,116	236,978,344	27,231,228

27,231,228 lbs. at $28.90 net ton........................$393,491.13

5474 Edgerton's total weight of pipe, claimed to include the 1½ in., 2 in., and 5 in., and with his excess of 20,000 feet of 4 in. corrected, is given as (p. 4060) 104,873,558 net tons or 209,747,116 lbs.

Calculating the mil-age of old and new pipe as apportioned by him, and on his weights, as follows (exclusive of 1½ in., 2 in. and 5 in.):

Size of pipe.	New.			Old.		
	Number of feet.	Weight per foot.	Total weight.	Number of feet.	Weight per foot.	Total weight.
1½						
2						
3	122,741	12	1,472,892	100,000	11	1,100,000
4	307,469	18	5,534,442	250,000	17	4,250,000
5						
6	1,129,000	30	33,870,000	1,000,000	25	25,000,000
8	278,000	44	12,232,000	250,000	38	9,500,000
10	41,286	55	2,270,730	30,000	50	1,500,000
12	171,536	72	12,350,592	150,000	58	8,700,000
16	53,900	110	5,929,000	45,000	100	4,500,000
18	17,633	130	2,292,290	12,000	120	1,440,000

	Size of pipe.	New.			Old.		
		Number of feet.	Weight per foot.	Total weight.	Number of feet.	Weight per foot.	Total weight.
5475	20	98,803	150	14,820,450	80,000	140	11,200,000
	24	25,956	200	5,191,200	20,000	185	3,700,000
	30	71,583	260	18,611,580	60,000	270	16,200,000
	36	11,242	360	4,047,120	11,000	360	3,960,000
		2,329,149		118,622,296	2,008,000		91,050,000

Gives a total of

New	118,622,296
Old	91,050,000
Total	209,672,296

which deducted from the 209,747,116 lbs. leaves 74,820 lbs., which presumably represents the total weight of the 1½ in., 2 in. and 5 in., not calculated in the above because no weight per foot has been stated.

Calculating this 1½ in., 2 in. and 5 in. on our weights, as follows:

1½ in.	1,407 ft. at 7 lbs.	9,849
2 in.	4,365 ft. at 10 lbs.	43,650
5 in.	1,799 ft. at 26 lbs.	46,774
		100,273 lbs.

5476 Q. And what does that show as to totals, in a word?
A. The difference between the weight used by the Consolidated Gas Company and those used by Mr. Edgerton amount to 27,231,228 pounds.

Mr. Kirby: This is a calculation of the difference between the weight as given by Mr. Edgerton and the weights as given by Mr. Simpson?

Mr. Mathewson: Precisely.

The Witness: No, they are not the weights as given, but the weights actually used.

Mr. Kirby: The weights which you testify were used and the weights which Mr. Edgerton assumes?

The Witness: They are the weights we have used.

Q. Now, what have you got to say as to Mr. Edgerton's estimate of width of cuts required for different sizes of pipe?

A. The widths are entirely too narrow.

Q. Is it possible to lay pipe in cuts of that width?

A. In some instances which he has given, the cut does not allow us to put the pipe in the trench.

Q. As an illustration, what?

A. On the sizes of eighteen, twenty, twenty-four, thirty and thirty-six inch, with a sheathed trench, there is not room even for the barrel of the pipe to go between the ranges, let alone the hub.

Q. Have you any modification to make in your estimate as to the width of trench actually required, after reading Mr. Edgerton's testimony?

A. None whatever.

Q. Is it often possible to lay any size of pipe on any of the streets of the city without coming in contact with some other sub-surface structures running parallel with it, which necessitates alterations or widening of the trench?

5477 A. With a gas pipe it is not, because with the gas pipe you are given a position by the city and you must take that position whatever is in your way.

Q. So far as the salt water mains of the city are concerned, what is the rule as to other pipes?

A. They go where they please.

Q. And are you compelled to remove your pipes?

A. We are in every instance that comes in their way.

Q. Furthermore, as to the laying of salt water mains, or other pipes by the city, may they lay them and do they lay them down the middle of the street?

A. They are laying the salt water mains now in the middle of the street in many instances.

Q. Is the company permitted to lay its pipe in the middle of the street?

A. No.

Q. What do you say as to Mr. Edgerton's statement, that it is practicable to put small sizes of cast iron pipe, such as three and four-inch, together, before lowering them into the trench?

A. I never heard of it done before he gave his testimony.

Q. Would you consider it practicable in New York City?

A. I would not dream of trying it.

Mr. **Burr**: That does not answer the question.

The **Witness**: Well, I do not consider it practicable at all.

Q. It would be a little different proposition if you were using screwed wrought iron pipe?

A. Yes, sir, that is frequently done; the pipe is screwed together and lowered into the trench.

Q. But in New York the pipe of your company is cast iron?

A. Cast iron, hub and spigot pipe.

Q. If you were to try to do that, lower it into the trench after screwing it together, would it be necessary to rub every joint and employ more men than it would in laying it otherwise?

5478 A. It would cost a great deal more money than laying it otherwise. I do not believe you could lay it that way without having to re-caulk the joints.

Q. Would the cost be greater or less than laying it in the usual way?

A. It would be greater.

Q. What do you say as to Mr. Edgerton's assumption of sixty-seven cents as the price per cubic yard for cost of excavation?

A. We cannot get excavation done in New York City for that.

Q. Sixty-seven cents per cubic yard?

A. No, we cannot.

Q. Do you know that from experience?

A. I know that from experience.

Q. What are you paying at present for excavation?

A. We are paying on one contract to the contractor the actual price he is being paid by the city.

Q. What is that?

A. Ninety-five cents per cubic yard.

Q. That is on Ninth Avenue in connection with the alteration necessary to the gas pipes on account of laying the thirty-six inch Croton main, is it?

A. Yes, sir.

Q. Will you look at page 4051 of the testimony. Taking his width of trench and depth of trench as per his testimony on page 4051, his yardage of 900,126 cubic yards, plus 10 per cent. for bell holes, or a total of 990,140 cubic yards, that would be the total, would it not, in place of his 914?

A. He gives 990,000 yards, does he not?

Q. That total should be what?

A. According to my measurements it should be, in place of 990,140.3 yards, 1,623,626.18 cubic yards.

Q. Now, Mr. Edgerton states that he computes rock excavation at $6 a yard, and on page 4,061 in giving his final figures, he computes 74,252 yards of rock as costing $371,770. Is that computation made at $6 per cubic yard, which he states?

A. No, sir; at $5 per cubic yard.

5479 Mr. **Kirby**: It so states.

Mr. **Mathewson**: Precisely. He states on page 4,053 that rock excavation cost $6.00, and when he comes to compute he uses $5.00.

Mr. **Kirby**: I called attention to that error at the time Mr. Edgerton put in his testimony, that he used $5.00 and that was the basis of his computation.

Mr. **Mathewson**: Look at page 4,053 and see if he does not say $6.00.

Mr. **Kirby**: He did, and it was by reason of that that I, in opening the case on November 22nd, called attention to it and said it was $5.00 and not $6.00.

Mr. **Mathewson**: Very good, which is the unit that Mr. Edgerton actually desires to assume.

Mr. **Kirby**: He has used $5.00 in his computation, and if he says $6.00 he intended to say $5.00.

Mr. **Mathewson**: Do you mean to say the first $6.00 was a clerical error or did he change his views?

Mr. **Kirby**: Yes. He did not change his views.

Q. On page 4,061 Mr. Edgerton has expressed his views as to the amount of lead necessary and has stated the price which he assumes to be 5.75 cents per pound. Can lead be bought and handled for that money in New York?

A. It could not at the time Mr. Edgerton testified. The day before Mr. Edgerton testified we got quotations for the very trust lead that Mr. Edgerton quoted. Our quotations were 5.95 cents delivered in our yard.

Q. That excludes handling?

A. That excludes handling and storage and interest.

Q. And carting to the works?

5480 A. No, not carting to the works, but just the handling and storing in the yard and interset.

Q. What would you say would be a minimum cost of the lead, six cents, or more or less?

A. Six cents would be rather low than high.

Q. If you assume six cents per pound, and take your actual weight against Mr. Edgerton's assumed weight for lead, it would make a difference of how much for lead?

A. Mr. Edgerton figures a total of lead required for straight pipe and specials of 4,304,080 pounds at 5¾ cents a pound. Taking our actual weights as are being used to-day and have been used for the last twenty or thirty or more years, the weight of lead would be 6,542,015 pounds.

Q. A difference of how many pounds and how much in money—well, it would be a difference of how much in money?

A. $147,220.90.

Q. Do you use, Mr. Simpson, any more lead than your experience shows you is necessary?

A. We do not, sir.

Q. Now, referring to Mr. Edgerton's testimony on page 4062 as to the cost of laying pipe per running foot of the different sizes, what criticism have you to make of his figures in that regard?

A. On all sizes Mr. Edgerton is too low; he is especially low on the larger sizes, where he seems to have either disregarded the fact that a derrick gang is necessary or else has forgotten it.

Q. Have you here an actual statement of the cost of laying thirty-six inch mains from East One Hundred & Eleventh Street to West 131st Street?

A. I have.

Q. Will you state what the actual cost is in detail?

A. It is as follows:

5481 Thirty-six Inch Main from East 111th Street to West 131st Street Stations; length, 12,254 feet; laid in 1904.

The total cost of yarning, running and caulking the joints* on this line was $5,920.90, an average cost per foot of	$.4832

---

*The number of joints on this line was 1,208, an average of one joint every 10.14 feet. This is a transfer main, direct between the stations, with no connections en route, and the total number of joints is much less than would be the case with a distribution main, having specials set in at the intersecting streets.

Rolling the pipe to the skids, lowering it into the trench, entering, leveling and blocking up required force of,

8 pipe and derrick men, $2.25 each	$18.00
2 men entering, levelling and blocking, $2.25 each	4.50
1 pipe and derrick foreman, $3	3.00
A total per day of	$25.50

This gang was engaged in the actual work of laying pipe for 133¾ days, equal to a total cost — $3,410,625 for 12,254 feet, or a cost per foot of	$.2783
Making a total cost per foot for laying and caulking of	.7615
As against Mr. Edgerton's estimate of	.2920
A difference per foot of	.4695

Q. Have you prepared a statement showing the difference upon Mr. Edgerton's figures as compared with the facts in laying the different sizes of pipe from six inches to thirty-six inches?

A. Yes, sir.

5482 Q. According to the mileage of the company?

A. Yes. It is as follows:

Mr. Edgerton's estimated cost per foot for laying and caulking pipe are much lower than this work can be done for in New York City.

Size.	Edgerton's price.	Cons. Gas Co. price.	Diff.	No. of feet.	Amount.
6	.043	.065	.022	2,129,088	46,839.94
8	.045	.089	.044	528,040	23,233.76
10	.0582	.105	.047	71,286	3,350.44
12	.0647	.152	.087	321,536	27,973.63
16	.0890	.220	.131	98,901	12,956.03
18	.1040	.265	.161	29,633	4,770.91
20	.1253	.320	.195	178,803	34,866.58
24	.1521	.425	.273	45,956	12,545.99
30	.2010	.570	.369	131,583	48,554.13
36	.2920	.762	.469	22,242	10,431.50

A total difference of.................................... $225,522.91

Q. Are you able to compare Mr. Edgerton's figures with actual bids to the city for laying pipe of similar size in connection with these water pipes?
A. Yes, sir.
Q. You might read it.

Mr. Kirby: What knowledge has the witness of actual bids to the city?

Q. What knowledge have you of actual bids to the city?
A. This was obtained from the city contract clerk.

Mr. Kirby: I object to it.
Mr. Mathewson: The city is a defendant.
Mr. Burr: What was the question?
(Question read.)
5483 Mr. Burr: Actual bids accepted by the city or merely proposals?

Q. Were they accepted by the city?
A. Bids accepted by the city.
Q. Will you state it?

The Master: Is your objection to the competency of it?
Mr. Kirby: My objection, in the first place, is that it is not the best evidence, and in the second place, it is not relevant.
Mr. Mathewson: I suppose it is subject to verification. The city is certainly able to cross-examine on that.
The Master: I will allow it. Of course, if you insist on having the records of the city contract clerk brought here or having that clerk to produce those things——
Mr. Kirby: No, I do not object to anything of that kind.
Mr. Burr: That, of Course, would be the best evidence, but I assume that Mr. Simpson is in a position to swear to the accuracy of what he is about to offer.
The Witness: I am not in this case, no sir.

Q. You had them got from the City Contract Clerk?
A. I had them got from the City Contract Clerk.

Mr. Burr: Then I object. If you bring some one here who got it from the clerk——

The Master: Yes.

The Witness: The man who got it is here.

5484 Mr. Kirby: We had to go to a great deal of trouble in bringing men down here from Danbury, who brought the oil down——

Mr. Mathewson: Do you object to it on this ground, Mr. Kirby.

Mr. Burr: I do not urge the technical objection, but I think at least you should have the man who got the paper from the Contract Clerk, to see that it is correct.

Mr. Kirby: Take it subject to that testimony, as we did.

Mr. Burr: Yes, subject to confirmation by this man who obtained it.

The Master: That is the best way to do it.

Mr. Mathewson: Very good, perhaps that is shorter.

Q. Now, will you state, Mr. Simpson?

A. For laying six-inch pipe, Bid A, 16 cents per foot; Bid B, 16 cents per foot; Bid C, 20 cents per foot.

Q. What is Mr. Edgerton's allowance for the same?

A. I haven't it here on this.

Mr. Kirby: Mr. Edgerton's allowance was for laying gas mains and not water pipes.

Mr. Mathewson: But it is the same thing, for laying.

Mr. Kirby: No, it is not the same thing.

The Witness: For twelve-inch Bid A, 20 cents per foot; Bid B, 35 cents per foot; Bid C, 40 cents per foot.

Q. That is simply for the laying?

A. Laying the pipe, that is all.

Q. That is labor per lineal foot?

A. Labor only, yes. That is all Mr. Edgerton gives. Mr. Edgerton gives the laying of the pipe and caulking, without any other consideration.

5485 Q. And the total including the labor per lineal foot, excavating and filling the trench per lineal foot, totals for the six-inch pipe, Bid A, 38.50; Bid B, 27.08; Bid C, 40?

A. Yes, sir; without paving.

Q. And the same as to the twelve-inch pipe, Bid A, 37; Bid B, 51, and Bid C, 66 cents?

A. Yes, sir.

Q. Also without paving?

A. Without paving.

Q. Have you the details showing the difference of $147,220.90 in the cost of the lead as between that actually used by the company and the weights used by Mr. Edgerton for lead?

A. Yes, sir. It is as follows:

5486 On Page 4062 Mr. Edgerton gives the weight of lead required for straight pipe		3,912,800 lbs.
plus 10 per cent. for lead in specials		391,280 lbs.
		4,304,080 lbs.
4,304,080 lbs., calculated at 5¾ cents lb		$247,484.60
As given in totals	$223,000	
+ 10 per cent	22,300	
		$245,300.00

Calculating on a joint every 10 feet (allowing for Specials), and on the weights per joint actually used by the Consolidated Gas Company, the total

Size.	No. of joints.	Weight per joint.	Total weight.
3	22,274	5	111,370
4	55,747	6	334,482
6	212,908	9	1,916,172
8	52,804	13	686,452
10	7,128	17	121,176
12	32,154	20	643,080
16	9,890	30	296,700
18	2,963	32	94,816
20	17,880	35	625,800
24	4,595	65	298,675
30	13,158	90	1,184,220
36	2,224	103	229,072
			6,542,015 lbs.

At 6c lb., or	$392,520.90
A difference of	$147,220.90

5487 Q. Now, on page 4,063 Mr. Edgerton states that he allowed $2.14 for carting earth from the trench without dumping. What is the actual cost?

A. Fifty cents a yard.

Q. And for carting and dumping together about $1 a yard?

A. Carting about fifty cents and dumping about fifty cents.

Q. So in that case Mr. Edgerton is more than twice as high as the fact, isn't he?

A. Yes, sir.

Q. Have you the figures showing what difference that would make?

A. Some eighty-six thousand dollars.

Q. Now, Mr. Edgerton calculates the cost of replacing asphalt at $2.75 per square yard. Do you know what the City allows per square yard for pavement over the salt water mains?

A. Yes, sir.

Q. How much?

A. $3.50 a square yard.

Q. On page 4,067 and following, regarding the widths of trenches for salt water mains, Mr. Edgerton has selected some cases and presented them here, but has he shown in any case the width of asphalt required to be paid for by the contractors?

A. I cannot find any case where he has shown it.

Q. Have you taken any measurements as to the width of trench for these salt water mains on your own account?

A. Yes, sir; a number of them.

Q. Have you them here?

A. I have.

Q. Have you prepared a tabulation of those you have measured?

A. Yes, sir, those that I measured personally.

Q. Is that it (handing paper)?

A. Yes, sir. It is as follows:

5488 *Measurements of Pavement Openings for Trench for Salt Water Mains, Taken by Mr. C. C. Simpson, November 23rd, 1906.*

Location.	Width of cut only.	Pavement, kind.	Size main.	Edgerton's.	
				Trench.	Repaving.
3rd Avenue, W. S. 45 ft. S. S. C. 14th St.......	9 ft.	Block...	24 in.		
3rd Avenue, W. S. 80 ft. S. S. C. 14th St.......	9 ft. 9 in.	Block...	24 in.	3 ft.	3 ft. 6 in.
3rd Avenue, W. S. 90 ft. N. N. C. 13th St.......	12 ft. 9 in.	Block...	24 in.		
3rd Avenue, W. S. 80 ft. S. S. C. 13th St.......	8 ft. 9 in.	Block...	24 in.		
3rd Avenue, W. S. 30 ft. N. N. C. 12th St......	7 ft. 2 in.	Block...	24 in.		
Narrowest bet. 12th and 14th Streets.					
13th Street, 20 ft. W. W. C. 3rd Ave...	7 ft. 6 in.	Block...	24 in.		
13th Street, 50 ft. W. W. C. 3rd Ave...	5 ft. 3 in.	Block...	24 in.		
13th Street, 80 ft. W. W. C. 3rd Ave...	5 ft. 4 in.	Block...	24 in.		
13th Street, 200 ft. W. W. C. 3rd Ave..	4 ft. 8 in.	Block...	24 in.		
12th Street, 25 ft. W. W. C. 3rd Ave...	4 ft.	Asphalt.	12 in.	2 ft. 4 in.	2 ft. 10 in.
17th Street, 280 ft. E. E. C. 5th Ave...	8 ft. 5 in.	Asphalt.	12 in.		
17th Street. 240 ft. E. E. C. 5th Ave...	8 ft.	Asphalt.	12 in.		
17th Street. 200 ft. E. E. C. 5th Ave...	4 ft. 6 in.	Asphalt.	12 in.		
17th Street. 165 ft. E. E. C. 5th Ave...	5 ft. 6 in.	Asphalt.	12 in.		
5th Avenue, W. S. 70 ft. N. N. C. 20th St.....	7 ft. 8 in.	Asphalt.	24 in.		
5th Avenue, W. S. 125 ft. N. N. C. 20th St....	7 ft. 8 in.	Asphalt.	24 in.		
5th Avenue, W. S. 50 ft. S. S. C. 21st St......	8 ft. 1 in.	Asphalt.	24 in.		

5489 Q. Now, this paper which you have just presented shows the actual width of cut which you measured as compared with the width of trench and repaving which Mr. Edgerton has assumed, does it not?

A. Yes, sir.

Q. For instance, I find the first one, the width of cuts, Third Avenue, west side, near Fourteenth Street, the width of cuts you measured was 9 feet, that is exclusive of any additional width in repaving, is it not?

A. Yes, sir, that is the actual width of the trench.

Q. What was the width allowed by Mr. Edgerton, three feet?

A. Three feet.

Q. Another one on Third Avenue near Fourteenth Street, the width is 9 feet 9 inches, is it not, against Mr. Edgerton's three feet again?

A. Yes, sir.

Q. And what is the width allowed by Mr. Edgerton in each of those cases? I see you have only put down the width once to cover a large number.

A. There are only two sizes of pipe given here, that is 12-inch and 24-inch, and 3 feet is the width for 24-inch and 2 feet 4 inches for a 12-inch pipe.

Q. Assumed by Mr. Edgerton?

A. Yes, sir. You will see these are all 12-inch where this starts, and these are all 24-inch, the three-footers (indicating).

Q. Mr. Edgerton criticises the width of a cut which you allow, and I want to ask you whether in actual fact the width that you allow is as much as the charges of the Asphalt Company which you have paid on the average?

A. The width of trench repaving that I have allowed falls in a great many cases far short of what we have had to pay the asphalt companies.

Q. And on the average?

A. Even on the average I think it is rather below it than above it.

Q. Referring to the 30-inch main which the company is laying in 136th Street from Lenox Avenue to Seventh Avenue, a 5490 distance of 750 feet, what have you to say as to the facts shown there as against Mr. Edgerton's estimate?

A. That was a main which was laid some years ago, it is not being laid now.

Q. Yes, laid some years ago.

A. The asphalt paid for by the Consolidated Gas Company measured 5.9985 feet in width, as against Mr. Edgerton's estimate of 4.1 feet.

Q. Now, have you any photographs here of these trenches which you measured or any that you examined, referring to the salt water mains regarding which photographs and measurements were presented by the defendants?

A. Yes, sir. The first one I have was taken on Third Avenue, between Thirteenth and Fourteenth streets, the first item on that sheet.

The width is on the back, and our width of trench and Mr. Edgerton's width of trench is given.

Q. Just state the width.

A. On Third Avenue, west side, 45 feet south of south curb of Fourteenth Street, actual width is 9 feet for a 24-inch salt water main. Mr. Edgerton's trench width 3 feet; the Consolidated Gas Company's width 5 feet for that size pipe. I might say that that is a 6 foot rule I am holding.

Q. And that is a temporary pavement?

A. That is a temporary pavement, that is pavement just put down, hand-paved, over the actual trench.

Q. As a matter of fact, is the repaving done by the city or by the asphalt company immediately after the gas company fills its trench, on putting down a gas pipe?

A. No, some of the cases Mr. Edgerton testified to in his testimony months ago have not been repaved yet.

Q. What is the effect of leaving these trenches with temporary pavement which the gas company has to put over the trench
5491 awaiting the final repaving on the edge of the trench?

A. Both edges of the trench are worn away.

Q. And broken down?

A. And broken down, and it is necessary to repave a wider trench than otherwise would be necessary.

Mr. Mathewson: I offer that in evidence.

Photograph received and marked Complainant's Exhibit 271.

Q. Does this correctly represent the width of the trench as shown by the temporary paving which is in the middle of the picture?

A. It does.

Q. Take the next one, Mr. Simpson?

A. Fifth avenue in front of No. 160. The cut varies in width from seven feet four inches to eight feet one inch for a twenty-four-inch salt water main. Mr. Edgerton allows three feet width of trench, and the Consolidated Gas Company five feet.

Mr. Mathewson: I offer that in evidence.

Photograph received and marked Complainant's Exhibit No. 272.

The Witness: This is Fifth Avenue between Seventeenth and Eighteenth Streets, the width of cut is nine feet ten inches for twenty-four-inch salt water main. Mr. Edgerton allows three feet, the Consolidated Gas Company asks for five feet, and there is the asphalt plainly shown there.

Mr. Mathewson: I offer that photograph in evidence.

Photograph received and marked Complainant's Exhibit No. 273.

Q. Take the next one.

A. Fifth Avenue, south curb of Twenty-first Street, width of trench, eight feet one-inch for a twenty-four-inch salt water
5492 main. Mr. Edgerton's width three feet; the Consolidated Gas Company five feet.

Mr. Mathewson: I offer that in evidence.

Photograph received and marked Complainant's Exhibit No. 274.

The WITNESS: The next is Third Avenue, west side, fifty feet south of south curb of Fourteenth Street, width of trench nine feet for twenty-four-inch salt water main. Mr. Edgerton allows three feet and the Consolidated Gas Company five feet.

Mr. MATHEWSON: I offer that in evidence.
Photograph received and marked Complainant's Exhibit No. 275.

The WITNESS: The next is Ninth Avenue, fifty feet north of the north curb of Sixteenth street; *twenty-* thirty-six-inch water main; width of trench seven feet three inches. Mr. Edgerton's width four feet; Consolidated Gas Company's six feet six inches. That pipe is now being laid and the trench is still open.

Mr. MATHEWSON: I offer that in evidence.
Photograph received and marked Complainant's Exhibit No. 276.

Q. What is the next one?
A. Third Avenue, west side, ninety feet north of north curb of Thirteenth Street. Width of trench twelve feet nine inches for a twenty-four-inch salt water main. Mr. Edgerton's width three feet; Consolidated Gas Company's five feet.

Mr. MATHEWSON: I offer that in evidence.
Photograph received and marked Complainant's Exhibit No. 277.

The WITNESS: Here are two photographs that belong in a
5493 pair. In the one case it is the trench that opens up on top,
and the other is the same location and shows the width to
which the trench had to be repaved when they got through.

Q. The first one showing the width on top refers to what place?
A. Gansevoort Street west of Hudson, twelve feet west of the west curb, looking east. Twelve-inch main.

Mr. MATHEWSON: I offer that in evidence.
Photograph received and marked Complainant's Exhibit 278.

The WITNESS: And that is the same place, but showing when they got through, that they had to repave that much.

Mr. MATHEWSON: I offer that in evidence.
Photograph received and marked Complainant's Exhibit No. 279.

Q. In other words, is it not true that the opening at the cut does not represent the full width of the opening down below, by reason of cave-ins and so forth, frequently?
A. In no case does the repaving have any reference at all to the width of the cut on top. With all the asphalt companies and all the Pacific and granite block pavement, if we open a cut two feet on top, and undermine the bank on each side, they allow for repaving it, repaving the entire width of the widest part of the trench, the same as shown in that case there. They are three or four feet wide, and they have to repave seven or eight feet.
Q. The last two exhibits you referred to?
A. Yes.

Mr. MATHEWSON: Perhaps we do not need to offer any others. We have some others.

5494 Q. You do not claim that every part of the trench for a salt water main is of this same width?

A. No, sir.

Q. But this is what goes to make up the average?

A. Yes, sir.

Q. And is it not true that cuts for putting down mains of any kind, as a rule, are ragged more or less and irregular, so that you have to cut out in repaving more than the width of the trench?

A. In connection with that, here is a very good proof of that in this photograph here.

Mr. Mathewson: I will offer that in evidence as illustrating the witness's statement.

Photograph received and marked Complainant's Exhibit 280.

Q. Describe the place, if you will?

A. Fifth Avenue, eighty feet south of the south curb of Nineteenth Street, twenty-four-inch salt water main. The trim for the asphalt on the west side is six inches and east side five inches, against Mr. Edgerton's allowance of three inches on each side. The actual width and the irregularity are not shown at all. It is taken just to show the——

Q. In other words, the measurement you have just given is in the narrow part where you saw the measurements made?

A. It only shows the width of the trim of the asphalt. This is the trim where it is trimmed off of the concrete five inches on one side and six on the other.

Q. Now, taking for a further example the large main laid downtown in 1904, before any investigation was had; the width allowed by Mr. Edgerton for the ditch would be 4.1 feet?

A. Yes, sir.

Q. And what was the actual width average of the repaving?

A. The actual width of repaving was 8.08 feet.

5495 Q. Or, in round figures, twice Mr. Edgerton's allowance?

A. Twice Mr. Edgerton's allowance, and more than what I called for.

Q. And do you remember what the average price of that asphalt pavement was there?

A. $3.44 per square yard.

Q. Have you any cuts or drawings, Mr. Simpson, illustrating the width of trench as compared with the size of the pipe which is being put in, allowing only the margin which Mr. Edgerton says is proper?

A. Yes, sir; they are big drawings. That is the full size drawing of the trench and pipe.

Q. To scale?

A. Well, it is the full size of the scale, you know. That is the actual size of it; the large circle is the hub.

Q. And the shaded circle is the——

A. Is the barrel of the pipe.

Q. What would be the width of the trench which Mr. Edgerton allowed?

A. 2.33 feet is the width given there—2⅓ feet.

Q. In sheathing that trench, how wide sheathing do you have?

A. I have allowed for two-inch sheathing, which is the smallest I or anybody else would use that knew about the business, and three-inch ranges.

Q. Is that the situation you frequently meet where you would have to use that sheathing?

A. Very frequently.

Q. Would the pipe go in that trench?

A. The pipe you see (indicating on sketch) would not pass the ranges.

Q. Would the hub of the pipe go in with the sheathing even if there were no ranges?

A. The hub of the pipe would not pass the sheathing even.

Mr. Mathewson: I offer this in evidence.

Received in evidence and marked Complainant's Exhibit 281.

5496 Q. Now let us see another pipe.

A. (Producing another sketch.) This is drawn to the full scale, twenty-inch pipe; two feet——

Q. The same result follows here?

A. The same result, that the barrel of the pipe would not pass inside the ranges, and the hub of the pipe would not go inside the sheathing.

Mr. Mathewson: I offer this in evidence.

Received in evidence and marked Complainant's Exhibit 282.

Mr. Mathewson: I will simply offer those other pipes, and I ask you to answer as to the thirty-six inch pipe.

Q. State about the blocking and wedges?

A. Mr. Edgerton has not allowed in any case one cent for blocking and wedging, which has to be used in every instance, especially on the larger sizes of pipes. All the sheathing and ranges are drawn to full scale.

The diagrams as to the twenty-four inch pipe, thirty inch pipe and thirty-six inch pipe are now offered in evidence.

Received in evidence and marked Complainant's Exhibit- 283, 284 and 285, respectively.

Q. (Indicating Exhibit 285.) This is the thirty-six-inch?

A. Yes, sir. There (indicating) is the line of the ranges, and there is the outside barrel of the pipe. You see there the entire distance between the outside of the pipe, and the hub is three inches, whereas the bottom or rammer takes up five inches, and no rammer could pass through there at all, and the barrel of the pipe even would not pass those ranges.

Q. So that you have to have a rammer to get down in there?

A. I have got to have room to put a man in there and use a rammer.

5497 Q. And there is about an inch left and no space at all left to put the rammer in?

A. That's it.

Q. Have you a rammer here?

A. I have.

Q. Let us see it, such as you would use for the thirty-six-inch main?

A. This (producing a long, wooden object) is a dummy rammer, actual measurement of the other one, and it is the standard rammer in this country to-day—in this city and country, which measures a little over five and one-half inches—five and three-quarter inches. It is round, you know.

Q. And that has to be used in what way?

A. That is used straight up and down like that for ramming (indicating). The tamping bar——

Q. How long is the bar?

A. This is the actual length.

Q. Well, about how long?

A. About five feet long.

Q. The man who rams has to get his rammer down at some sort of an angle?

A. Yes, the rammer is held at an angle like that (indicating).

Q. An angle of say fifteen degrees?

A. Pretty nearly forty-five degrees.

—. In order to ram it down thoroughly?

A. In order to get under the farthest barrel of the pipe.

Q. Now, this that you have produced is a regular rammer (indicating an iron implement brought into the room)?

A. A standard rammer as used by our company and practically all the gas companies in the country to-day.

Q. And the head of the rammer is circular?

A. Yes.

Q. What diameter?

A. Five and one-half inches full, or five and three-quarters.

Q. And the rod is an inch and a half?

A. About an inch and a quarter.

Q. You have to get that rammer in underneath the pipe?

5498 A. Underneath the lowest edge of the most extreme curve of the pipe.

Q. Mr. Edgerton spoke something about laying a pipe by pudding or puddling in connection with the relaying of the pipe. What is puddling in refilling?

A. Puddling is throwing in the earth loose, and then filling the cut with water, like a water settling of the earth.

Q. What do the rules of the Street Department or of the Department of Highways, whatever Department has charge in the City of New York, require as to refilling?

A. The rules themselves do not forbid puddling, but we have been repeatedly forbidden to puddle, and the rules themselves specify how the back fill shall be put in. I have got the regular rules here.

Q. Of the City of New York?

A. Yes, sir. "General Rules and Instructions for Opening and Refilling Trenches Made by Private Corporations and Individuals. Issued for the Guidance of Inspectors," by William Brookfield, Commissioner of Public Works. They have never been altered since; they are the same rules in force to-day.

Q. The Commissioner of Public Works in the City of New York?

A. Yes, sir.

Mr. Burr: I object to that as not competent evidence, not proper proof of the existence of those rules.

The Witness: They are in existence to-day.

The Master: For the sake of convenience in view of the witness' statement I will take it as it is, and then you can have formal proof submitted, Mr. Mathewson, if it is insisted upon.

Mr. Mathewson: We insist that this is proof. These are rules that have been delivered to us by the Department of Public Works of the City of New York, which have never been revoked.

5499 Mr. Burr: You are trying to prove the adoption of certain rules at a certain time and their continued existence up to a certain time.

Mr. Mathewson: No. A state of affairs once proved to exist is presumed to continue.

Mr. Burr: You have not proved they were legally adopted.

The Witness: I asked the question of Chief Engineer Olney of the Department of Highways three weeks ago, and he told me that puddling absolutely would not be permitted in any instance.

Mr. Burr: Exception.

The Master: I will dispose of it in that way. If it is insisted upon it will be easy enough to produce somebody here from the department.

Mr. Burr: Exception.

The Witness (reading): Rule No. 3. "The refilling of the trenches must be done in horizontal layers of from four to six inches, which must be thoroughly compacted by hand ramming until it is firmly and sol-dly replaced. There shall be two rammers to one shoveller, and in case the refilling is thrown in faster than it can be rammed, the inspector must stop the shovelling until the ramming is satisfactory."

Q. Is that a quotation from the rules delivered by Mr. Brookfield, Commissioner of Public Works of the City of New York?

A. Yes, sir; and embodied in my rules in my department, of which you have got a copy there.

Q. Have those rules ever been changed?

A. Never, sir.

Q. As to the depth of pipe required by the city, have you a proposal or bids or estimates issued by the City of New York in 1905, providing for the depth of pipe and the filling underneath?

5500 Mr. Kirby: What kind of pipe?

Mr. Mathewson: Water pipe.

Mr. Kirby: I object.

The Master: That is preliminary, I suppose. We will wait and see what is to be brought out.

A. I have.

Mr. Burr: As I understand, this paper handed Mr. Simpson is a blank proposal issued by the city to the contractors, and there is no evidence at all that it has any bearing upon the laying of gas pipes. It may have been for some special situation that the commissioner of that department was called upon to get specially for this form. No proof that whatever clause is in that proposal is a general clause adopted by all departments where laying of pipes is concerned.

Mr. Mathewson: Isn't it some evidence of what this city considers the proper depth below the surface of the pipe to free it from settlings of the surface?

The Master: No, I do not think so, Mr. Mathewson.

Mr. Mathewson: Very good. I understand the Master thinks it is not competent, and I therefore will not press it.

Q. At page 4089 Mr. Edgerton states he did not know it was ever necessary to go under sewers in laying gas pipes. What is the fact in the island of Manhattan?

A. It is very rarely we can cross an avenue to-day with any pipe larger than eighteen inch without having to go under one, and sometimes even three sewers.

Q. How deep do you sometimes have to go below the surface in cases of that kind?

A. Sometimes reach a depth of close onto or full twenty feet.

5501 Q. Now, certain testimony was presented here by Mr. Midgely, saying that he had measured the depth of a certain number of mains of the company at street corners, and he found these depths to be two feet to two feet and two inches, in certain cases, which were about one-third of the number of measurements that he made. Have you examined those instances in which he found the depth as little as I have stated?

A. I have not been on the spot.

Q. No, but have you examined this list?

A. Yes.

Q. Do you find every one of those to be at a street corner or crossing?

A. Yes, sir.

Q. What is the case at a street corner or crossing, which brings the pipe higher than the average, if it is brought higher?

A. Well, at practically every street crossing in Manhattan there is so much congestion that it is a question of taking any gas pipe of any account over everything, or under everything. There is no room to get through, and the practice with small pipes where you can still maintain some cover is to go over. With a large pipe where no cover could be maintained it is best to go under everything.

Q. And these are small pipe?

A. In every instance, except the twenty inches, small pipes.

Q. And would you consider that the fair average of the depth at which pipe is carried between streets?

A. It certainly is not.

Q. And the larger pipes, you say, have to go down under?

A. Down under everything.

Q. Is that the reason none of the large pipes are found here in these schedules?
A. Probably, yes.

Mr. Burr: I object to that answer. If he does not know, he can say so. And I move to strike it out.
Answer stricken out.
Mr. Mathewson: I will put the question in another way.

5502 Q. Would measurements of this character and of that depth reveal or disclose the larger and more expensive pipes that have to go underneath?
A. In very rare cases only.
Q. How about crossing avenues where electric companies are now operating with the underground trolley? Do you not have to go underneath?
A. Yes, sir.
Q. Mr. Edgerton at page 4,090 advanced a suggestion that in taking out rock, stone is salable. Is this the case as to such rock as you excavate in New York?
A. I have never sold a square inch. I never knew of a square inch of rock being sold from a trench in New York City.
Q. Is it of a character which is salable?
A. No, sir; it is not.
Q. Is it possible, in laying your mains here, to blast off rock in great masses, so that it can be sold for any purpose like building?
A. No, sir; it comes off, in every case in a trench of that character, in small pieces.
Q. Have you ever been able to sell the rock?
A. No, sir; never.
Q. Have you tried to make sales of rock and see what could be obtained for it?
A. We have always tried to get the cheapest price we could for having it carted away.
Q. Have you tried to sell it sometimes?
A. I don't remember having tried to sell it.
Q. Have you ever received any bid for it?

Mr. Burr: He says he never tried to sell it.
Mr. Mathewson: I ask, have you ever received any bid for rock of that kind?
The Witness: No, sir.

Q. Mr. Edgerton allowed nothing for the carting and dumping of the rock. The number of yards excavated by him at 5503 $1.00 a yard, how much would that amount to?
A. Fifty cents a yard for cartage and fifty cents a yard for dumping. $74,252.
Q. Mr. Edgerton, at page 4,105, made the suggestion that the asphalt company had made arrangements for repaving the trench for less cost than the contract price was here. Have you ever had any experience of that kind?
A. Never, sir.

Q. Has the company ever, during your experience, been able to pay a cent less than a contractor was allowed to charge by the City?

A. Never one cent.

Q. Have you produced here, accurate to scale, sketches showing the condition of certain streets in New York City at certain points?

A. They are all avenues at certain crossings; yes, sir.

Q. Showing the difficulties in the way of the crossing of the street with pipes of the Gas Company?

A. Yes, sir.

Q. How many of them are there?

A. I don't really remember how many there are.

Q. This one is Broadway and Bleecker Street, looking North?

A. Yes, sir.

Mr. Mathewson: I offer that in evidence.

Mr. Burr: One moment.

By Mr. Burr:

Q. Did you make these sketches yourself?

A. They were made under my supervision.

Q. From measurements taken by you?

A. No, sir; measurements taken under my orders.

Q. Can you specify, of your own knowledge, that the measurements appearing upon these charts or diagrams are correct?

A. I haven't any doubt but what they are correct.

Q. Can you swear they are correct?

Mr. Mathewson: I suppose every drawing you put in
5504 here was not drawn in every line by your witness, was it?

A. These drawings were all made by employés in my department, under my direction.

Q. Were you present when the measurements were made in each case?

A. I was not; no, sir.

Q. Therefore you cannot say that the measurements as they appear upon these charts or diagrams are correct dimensions or measurements. You believe they are, but you don't know, isn't that the fact?

A. I think that is right.

Mr. Burr: Well, I object to them.

The Master: If that objection is pressed I will receive them on the same understanding as before, and you will have to bring somebody here who made the measurements before you get through, Mr. Mathewson.

Mr. Burr: Exception.

Received in evidence and marked Complainant's Exhibit 286.

By Mr. Mathewson:

Q. What is this one?

A. West Broadway at Canal Street, looking North.

Mr. Mathewson: I offer it in evidence.

Received in evidence and marked Complainant's Exhibit 287.

Q. I will ask you as to all of these if you are yourself familiar from your records or data with the fact that the sub-surface structures appearing here are in the street, and with the general location of them—I mean in these various sketches?

A. Yes, sir.

Q. And, without exact exact measurements, do they conform generally to your knowledge of the situation there? 5505

A. My general knowledge only. Of course, I have no detailed knowledge of every corner.

Q. This is Broadway at Morris Street, looking north, isn't it?

A. Yes, sir.

Mr. Mathewson: I offer this one in evidence.

Received in evidence and marked Complainant's Exhibit 288.

Q. This one is Sixth Avenue and Fourteenth Street, is it?

A. Yes, sir.

Mr. Mathewson: I offer it in evidence.

Received in evidence and marked Complainant's Exhibit 289.

Q. This sheet is Third Avenue and Fourteenth Street, looking North, is it?

A. Yes, sir.

Mr. Mathewson: I offer it in evidence.

Received in evidence and marked Complainant's Exhibit 290.

Q. The paper you now present represents Fourth Avenue at Fourteenth Street, showing the subway going across the entire street from houseline to houseline, doesn't it?

A. Yes, sir.

Mr. Mathewson: I offer that in evidence.

Received in evidence and marked Complainant's Exhibit 291.

Q. Also this one shows Ninth Avenue at Fourteenth Street, looking north?

A. Yes, sir.

Mr. Mathewson: I offer that one in evidence.

Received in evidence and marked Complainant'e Exhibit 292.

5506 Q. And this is Twenty-third Street and Second Avenue, looking north, is it?

A. Yes, sir.

Mr. Mathewson: I offer that in evidence.

Received in evidence and marked Complainant's Exhibit 293.

Q. Referring to the last exhibit, Complainant's Exhibit 293, what room does that show for more pipe?

A. It shows that as far as the street is concerned between curb lines, that there is no room, unless one went under everything, to lay even a three-inch pipe and get any cover on it.

Q. And this paper you now show me is Second Avenue and Forty-second Street?

A. Yes, sir; the same conditions exist there.

Mr. MATHEWSON: I offer that in evidence.

Received in evidence and marked Complainant's Exhibit 294.

Q. These sketches or drawing which have just been offered are only a few of many that have been made under your supervision, are they not?

A. They are.

Q. And do they show generally and substantially similar conditions in various parts of the city?

A. At every crossing of every avenue in New York City, south of 125th Street.

Q. And these are merely illustrative that you have introduced?

A. Yes, sir.

Q. Now, referring to the testimony that you have just given, have you prepared in convenient shape the calculation showing the difference in cost of paving between the cost as the company has found it and Mr. Edgerton's estimate?

A. Yes, sir; it is as follows:

5507 Mr. Edgerton states (p. 4066) that "the cost of the asphalt and equivalent pavement was.........	$2,883,664.32
Based on 90 per cent of the mileage of each size, with an allowance of 6 in. over and above the trench widths stipulated by him, at $2.75 per square yard.	
Based on the above figures, the number of square yards (excluding the 1½ in., 2 in. and 5 in. pipe, which he claims has been included in his total, but which has been disregarded here because he gives no trench widths), would be 1,090,572.5 square yards at $2.75..	2,999,074.37
or, by his own figures, a shortage of........................	115,410.05
Calculating the repaving required on 90 per cent. of the mileage of each size, at the widths submitted by Mr. Simpson, and a cost of $3.25 per square yard, the total would be 1,448,744.3 square yards at $3.25..	4,708,418.98
Deducting Mr. Edgerton's figures as given on p. 4066, and above.................	2,883,664.32
A difference of for paving alone of.........................	$1,824,754.66

(The detailed calculation of these items will be found below.)

5508 CONSOLIDATED GAS COMPANY. MR. H. H. EDGERTON.

Size.	Total feet of trench.	Width of repaving.	Total square feet.	Width of trench.	Total square feet.
1½	1,407	2 ft. 6 in.	3,165.7		
2	4,365	2 ft. 6 in.	9,826.3		
3	222,741	3 ft. 0 in.	601,400.7	1 ft. 10 in.	367,455.8
4	557,469	3 ft. 0 in.	1,505,166.3	1 ft. 10 in.	919,656.6
5	1,799	3 ft. 0 in.	4,857.3		
6	2,129,088	3 ft. 0 in.	5,748,537.6	1 ft. 10 in.	3,512,356.5
8	528,040	3 ft. 6 in.	1,663,326.0	2 ft. 0 in.	950,472.0
10	71,286	3 ft. 6 in.	224,550.9	2 ft. 1 in.	133,447.4
12	321,536	3 ft. 6 in.	1,012,838.4	2 ft. 4 in.	674,260.9
16	98,901	4 ft. 0 in.	356,043.6	2 ft. 4 in.	207,395.4
18	29,633	4 ft. 0 in.	106,678.8	2 ft. 4 in.	62,140.4
20	178,803	4 ft. 6 in.	724,152.2	2 ft. 6 in.	402,306.7
24	45,956	5 ft. 6 in.	227,482.2	3 ft. 0 in.	124,081.2
30	131,583	6 ft. 0 in.	710,548.2	3 ft. 7¼ in.	426,328.9
36	22,242	7 ft. 0 in.	140,124.6	4 ft. 0 in.	80,071.2
			13,038,698.8 square ft.		7,859,973.0 square ft.

1,448,744.3 square yds.
at $3.25
$4,708,418.98

To which is added 90 per cent. of the total mileage, at a width of 6 in. .... 1,955,182.0 square ft.

9,815,155.0 square ft.

1,090,572.5 square yds.
at $2.75
$2,999,074.37

NOTE.—These calculations are based on 90 per cent. of the total feet of trench.

5509 The WITNESS: Mr. Edgerton, taking his average of trench width at $2.75 per square yard, allows $2,883,664.32. His figures would reach according to his own calculation $2,999,074.37, and taking his own width of trench and his own price at $2.75 per yard, or by his own figures, a shortage of $115,410.05. Taking this repaving at the width of trench as given by him and a price of $3.25 per square yard, it would amount to $4,708,418.98, or $1,824,754.66 in excess of Mr. Edgerton's figures.

Q. Your statement is now the summary of the detail which has been spread upon the record?

A. Yes, sir.

Q. Have you also prepared the figures showing the difference between Mr. Edgerton and the actual cost to the company as to excavation?

A. I have shown the difference between the figures of Mr. Edgerton's excavation and the figures as given by him in my testimony. They are as follows:

5510 CONSOLIDATED GAS COMPANY'S DIMENSIONS.

	Trench. Total feet.	Width.	Depth.	Cubic feet.
1½	1,407	2 ft. 0 in.	2 ft. 10½ in.	8,074.25
2	4,365	2 ft. 0 in.	2 ft. 11 in.	25,494.84
3	222,741	2 ft. 6 in.	3 ft. 0 in.	1,670,558.33
4	557,469	2 ft. 6 in.	3 ft. 1 in.	4,292,510.44
5	1,799	2 ft. 6 in.	3 ft. 2 in.	14,256.19
6	2,129,088	2 ft. 6 in.	3 ft. 3 in.	17,298,847.22
8	528,049	3 ft. 0 in.	3 ft. 5 in.	5,417,490.40
10	71,286	3 ft. 0 in.	3 ft. 7 in.	756,618.80
12	321,536	3 ft. 0 in.	3 ft. 9 in.	3,617,287.50

5512 The WITNESS: Mr. Edgerton allows 900,126 cubic yards plus 10 per cent. for bell holes, or a total of 990,140.3 cubic yards at 67 cents a yard, against my measurements of 1,623,626.18 cubic yards at 95 cents a yard, which makes a difference between Mr. Edgerton's figures and mine, and which brings my figures $1,038,295.20 more than Mr. Edgerton's on the excavation of trenches.

Q. Your figures, you stated, are based on the fact?

A. On the trenches as we have dug them and made them for years.

Q. And you found it necessary to make them?

A. Yes, sir.

Q. Now, there is a crossing on avenues by a street every two hundred feet?

A. Every two hundred feet, yes, sir.

Q. And in view of these sub-surface structures that you find isn't it nearly always necessarily a case either of extreme width or of extreme depth, and often of both, in crossing those streets?

A. Yes, sir; in practically every instance.

Q. Have you also tabulated the figures showing the value, or cost of sheathing in the trench, which Mr. Edgerton did not include in his testimony?

A. Yes, sir.

Q. That deals with the larger sizes of pipes?

A. It is the value of sheathing left in the trench.

Q. And that amounts to how much?

A. $50,505.82.

Q. As left in the mileage of the company?

A. Left in the mileage of the company?

Q. Yes, that applies to the mileage of mains of the company?

A. No, it is just an additional expense in laying mains that Mr. Edgerton has not taken into account.

Q. Precisely. As applicable to the mains of the Consolidated Gas Company?

A. Yes, sir. The details follow:

5513 VALUE OF SHEATHING LEFT IN TRENCH.

Size of main.	Feet of board measure per lin. foot of main.	Price per 1,000 feet B. M.	Price per foot of pipe.	Number of feet.	Value.	
16″	1.750	35.00	.06125	98,901	$6,057.69	
18″	1.987	35.00	.06955	29,633	2,060.83	
20″	2.150	35.00	.07525	178,803	13,454.93	
24″	2.375	35.00	.08312	45,956	3,819.86	
30″	2.725	35.00	.09537	131,583	12,549.10	
36″	3.163	35.00	.11071	22,242	2,462.41	
					$40,404.82	
						$40,404.82
Plus cost of driving sheathing at $8.75 per 1,000 feet, Board Measure......................						$10,101.00
						$50,505.82

Q. Now, as an illustration on that, what about the thirty-six inch main between 111th and 131st Streets?

A. In this case we laid a thirty-six inch main in 1904 and were compelled to leave in the trench 38,766.75 feet of board measure of sheathing.

Q. Why were you compelled to leave it in the trench?

A. In some cases it is not wise to draw it on account of endangering the pipes of our own system or water pipes or something of the kind. In other cases, we are by the city forbidden to draw the sheathing. Then again, in that soil where you are down deep it is not wise to draw the sheathing because sometimes you have to dig up your main for some future purpose, it is well to have the sheathing in.

Q. Now, have you made a computation of the cost of sheathing which is not left in the trench?

A. Yes, sir.

Q. For the different sizes of pipe?

A. Yes, sir. It is as follows:

5514 Mr. Edgerton has made no allowance for the cost of sheathing, which on all pipe 16 in. diam. and larger, is necessary on 50 per cent. of the mileage and on sizes under 16 in., on 10 per cent. of the mileage.

Size.	10 per cent. of mileage.	50 per cent. of mileage.	Feet board measure per foot of main.	Total feet board measure.
6 in.	212,908		16.20	3,449,109.6
8 in.	52,804		16.87	390,803.5
10 in.	7,128		17.65	125,809.2
12 in.	32,153		18.60	598,045.8
16 in.		49,450	20.65	1,021,152.8
18 in.		14,816	21.28	315,295.1
20 in.		89,401	22.05	1,971,303.1
24 in.		22,978	23.50	539,983.0
30 in.		65,792	25.60	1,684,262.0
36 in.		11,121	28.10	312,500.0
				10,908,264.

10,908,264 feet at $20 per M. feet B. M. =	218,165.28
Labor, at $8.75 per M. feet B. M. =	95,847.28
	$314,012.56

This calculation is based on

Lumber at..................	$35.00	per M. feet.
Less salvage.........	15.00	" " "
Net cost...............	$20.00	" " "

Labor—Average rate $2.05 per day.

(The loss by cutting and wastage, the cost of pulling sheathing and carting to yard are allowed for in the Salvage Credit.)

5515 Q. It shows what?

A. That with our system to-day in New York City I have estimated the cost of sheathing at $314,012.56, deducting for any possible salvage we might obtain.

Q. Is that also from the company's experience and your own knowledge in that regard?

A. Yes, sir.

Q. Did you find that Mr. Edgerton made any allowance for blocking and wedges?

A. Not one cent.

Q. Have you made a computation of the cost of blocking and wedging?

A. Yes, sir.

Q. As to the Consolidated mains?

A. Yes, sir. It amounts to $40,784.17. The computation is as follows:

VALUE OF BLOCKING AND WEDGES.

Size.	Size block.	Size wedge.	Cost per lineal foot. Blocking.	Cost per lineal foot. Wedges.	Total.	Number of feet.	Amount.
3		14 x 2½ x 3 in.		.0053	.0053	222,741	1,180.53
4		14 x 2½ x 3 in.		.0053	.0053	557,469	2,954.59
6		14 x 2½ x 3 in.		.0053	.0053	2,129,088	11,284.17
8		14 x 2½ x 3 in.		.0053	.0053	528,040	2,798.61
10		14 x 2½ x 3 in.		.0053	.0053	71,286	377.82
12	1 ft. 4 in. x 3 in. x 6 in.	14 x 2½ x 3 in.	.0125	.0053	.0178	321,536	5,723.34
16	1 ft. 4 in. x 3 in. x 6 in.	14 x 2½ x 3 in.	.0125	.0053	.0178	98,901	1,760.44
18	1 ft. 4 in. x 4 in. x 8 in.	14 x 2½ x 3 in.	.0222	.0053	.0276	29,633	817.87
20	1 ft. 6 in. x 4 in. x 8 in.	14 x 2½ x 3 in.	.0250	.0053	.0303	178,803	5,417.73
24	1 ft. 6 in. x 4 in. x 8 in.	14 x 3 x 4 in.	.0250	.0100	.0350	45,956	1,608.46
30	2 ft. 0 in. x 4 in. x 8 in.	14 x 3 x 4 in.	.0334	.0100	.0434	131,583	5,710.70
36	2 ft. 6 in. x 4 in. x 8 in.	14 x 3 x 4 in.	.0417	.0100	.0517	22,242	1,149.91
							$40,784.17

Calculations based on

Spruce Blocking 37.50 per M. Board Measure.
Oak Wedges 14 x 2½ x 3 1.6c each.
Oak Wedges 14 x 3 x 4 3.0c each.
One block and two wedges to six feet of pipe.

PAGE BOUND VERTICAL IN BOOK

5517 Q. And have you made a computation as to the cost of bridging for which Mr. Edgerton did not make allowance?

A. That is only a rough estimate. It is what I consider would be a minimum, absolute minimum cost of the bridging of streets and hydrants necessary for the laying of our main system.

Q. That is how much?

A, $30,000.

Q. Now, have you taken Mr. Edgerton's estimate of the total cost of reproduction or replacing the mains of the Consolidated Gas Company as given on page 4,065, to wit: $8,919,792.55, and made additions to his calculation of the items in which he has erred or which he has left out?

A. Yes, sir.

Q. Is that it?

A. Yes, sir. It is as follows:

5518 Mr. Edgerton's estimate of the total cost of reproducing or replacing the mains of the Consol. Gas Co. is given as (p. 4066).....................			$8,919,792.55
The following items, on which he has made no calculation, should be included:			
Difference in pipe weights as estimated and as actually used..................	$393,491.13		
Plus 10 per cent. for special wastage, etc., as calculated by Mr. Edgerton...	39,349.11		
		$432,840.24	
Difference in asphalt pavements on both price and width	$1,824,754.66		
Difference in earth excavation, on price, width and depth.	1,033,295.20		
Value of sheathing left in trench, and labor at $8.75 per M ft. B. M....	50,505.82		
Value of blocking and wedges....................	40,784.17		
Difference in lead actually used and as calculated, both price and amount..	147,220.90		
Cost of sheathing trenches, 10% of mileage under 12", 50% over 12".......	314,012.56		
Difference in cost of laying and caulking, actual as against estimated.....	225,522.91		

Cost of bridging............	$30,000.00		
Cost of carting and dumping rock....................	74,252.00		
		$3.740,348.22	
		$4,173,188.46	
To which is added 10% for engineering supervision, and expense, cost of city inspection, interest on and wear and tear of tools and plant, possibilities of obstruction on streets which would delay the work, serious obstruction met with under ground, including sub-surface structures, clerical expense, suits for damages and other undistributed expenses..................		$417,318.85	
		$4,590,507.31	$4,590,507.31
			$13,510,299.86

5519 Q. And making these corrections, the cost of the reproduction of the mains instead of $8,919,792.55 would be how much?

A. $13,510,299.86.

Q. And that is nearly a million dollars more than your estimated cost of reproduction?

A. $900,000 more.

Q. That includes, however, the cost of carting and dumping the carting at $2.14 instead of your cost of carting and dumping at $1, and some other errors, which would reduce the total?

A. Yes, sir, and possible underestimates on my part.

Q. You mean in making up your total of $12,656,000 for reproduction?

A. Yes, sir, and in a good many cases I have been too conservative.

Q. Have you been dealing with pressure in mains and seen the effect of the pressure and of gas escaping from mains under pressure during the last twenty-five or thirty years?

A. I have, yes, sir.

Q. What have you to say as to the feasibility of distributing or putting gas through the City of New York under a pressure of twenty or thirty pounds as suggested by Mr. Edgerton?

A. I should be very sorry to have charge of the mains when we had such pressure as that, as he is dealing with.

Q. Have there been accidents to the mains of the company which have allowed the escape of gas within recent times?

A. A great many accidents to the mains with the present pressure we are carrying.

Q. Will you give me some illustrations?

A. The most recent one I recall was on October 13th at Forty-third Street and First Avenue. In that case the Consolidated Telegraph

and Electric Subway Company were laying a subway along one side of our twenty-inch gas mains. They fired an unusually heavy blast, it broke the mains and the gas immediately caught fire and blazed to the very top of the tenement houses alongside, and except for
5520 the promptness of our men—the watchman we had there was seriously burned and had to be taken away in an ambulance—and we had some men working around the corner a block away, and the superintendent of the district happened to be crossing First Avenue and saw the blaze from a mile away, and drove right down. So by a combination of circumstances, being ready, we were able to put the fire out nine minutes after it happened.

By Mr. PAGE:

Q. Do you claim that that was due to the pressure?

A. That was due to the gas in the main being ignited, and the pressure on the gas in that main was two inches or 1/14 part of a pound. Now, the only reason that the block was not put on fire was on account of the prompt work of our men who happened to be there. By the time we had the stoppers in and the gas turned off, the windows of the tenement house alongside and a saloon—the glass was all cracked and ready to break in. In another two minutes the windows would have gone, and the whole place also, and you wouldn't have been able to get near the place.

By Mr. MATHEWSON:

Q. What would be the result of an accident of that kind if the gas were coming through under a pressure of twenty or thirty pounds instead of 1/14 of a pound?

Mr. BURR: Objected to as being hypothetical. He has not shown he has any experience in the effect of gas explosions or the effect of fire arising, as he has testified in this particular instance in the gas mains. I do not think that is competent testimony.

5521 The MASTER: He testified he had some experience with escaping gas. I think it is permissible to ask him, as an expert, what in his opinion would be the effect of gas escaping under a greater pressure than such as he has seen.

Exception.

A. I know in this case here, with a pressure of two inches, the matter would have been very serious indeed if our men had not been on the spot and put it out. If the pressure was twenty pounds, or 560 inches, I don't know what would have happened. There was a hole in the side of the pipe four feet long by eighteen inches wide.

Q. Would that, in your judgment, have been a very serious situation, or wouldn't it?

A. I don't believe the firemen themselves could have got within 300 feet of the place, and nothing in the world could have possibly saved that block.

Q. Well, you saw the results of the explosion which took place in front of this building on Wall Street a short while ago, or of the settling of some pipes, or something like that?

A. Yes, sir.

Q. Would that same effect possibly have broken a gas pipe in settling?

A. It was just a chance that the gas pipe was not broken. If the gas pipe had been nearer to the break it would have broken. In this case we happened to lie closer to the curb, and the water main broke and our gas pipe did not.

Q. If the gas had been going through the main in Wall Street at the pressure of twenty or thirty pounds and it did break, would you apprehend serious consequences from that?

The Master: That is getting a little remote.

Mr. Mathewson: Very good.

5522 Q. Well, I will ask whether, in your judgment, from your knowledge of pressure and your dealings with it and observation of its effects, it would be possible, by any such system as Mr. Edgerton has outlined, to maintain the pressure even under his system at every point and at all hours, within a limit of two and one-half and one inch as he testified?

A. I am morally certain it would not be possible.

Q. Assuming, however, that mains were to be put in as suggested by him, and valves put in wherever possible in order to equalize the pressure, have you computed what would be the cost to-day of such a system?

A. I have.

Q. How much, in your judgment, would it cost to put that in?

A. Do you mean the exact figures?

Q. Well, about.

A. Over four million dollars.

Mr. Kirby: Are you going to leave it to me to prove all the details of these four million dollars?

Mr. Mathewson: No; not if you want the details.

Q. Is this the detail to which counsel has referred as making up your total?

A. Yes, sir.

Q. That involves valves where?

A. It involves in the first place section valves on all the main lines; it involves, of course, additional valves to shut off or confine the gas to certain areas. Probably the only pipe that could be used would be flanged steel pipe, we would have to use expansion joints every five hundred feet, or according to the conditions. We would not be able to take such runs of pipe; we would have to go down and around and under foundations so there would be an expansion joint required every five hundred feet. The detail is as follows:

5523 *IN RE* TO MR. E.'S SUGGESTED HIGH PRESSURE MAINS.

74,000 ft. of 24-in. flanged steel pipe at $10.00 per ft....	$740,000
Labor, cartage, laying, etc., on above at $15.00 per ft...	1,110,000
148 expansion joints at $800.00 each..................	118,400
74 section valves and vaults for same at $200.00 each...	14,800
36,550 ft. of 20.-in. flanged steel pipe at $7.00 per ft....	255,850
Labor, cartage, laying, etc., at $11.00................	402,050
73 expansion joints at $500.00 each..................	36,500
36 section valves and vaults for same at $150.00.......	5,400
14,660 ft. of 16-in. flanged steel pipe at $5.50 per ft.....	80,630
Labor, cartage, laying, etc., at $7.00 per ft............	102,620
30 expansion joints at $300.00 each..................	9,000
15 section valves and vaults for same at $100.00 each...	1,500
For additional trunk line leading from high pressure main to the various areas, and then "letting go" through governors to each district, allowing for 25 areas and a 16-in. steel main, 2,500 ft. long to supply each area:	
62,500 ft. of 16-in. flanged steel pipe at $5.50 per ft.....	343,750
Labor, cartage, laying, etc., at $4.50 per ft............	281,250
125 expansion joints at $300.00 each................	37,500
Connections, valves (other than section valves), governors and vaults for these valves and governors	50,000
5524 70,000 yards of new paving at $3.25 per yard..	227,500
Making a total of.........................	$3,816,750
Add for contingencies of all kinds, 10 per cent.........	381,675
Grand total..............................	$4,198,425

By Mr. **Burr**:

Q. What was that computation made by you?

A. By me; yes, sir.

By Mr. **Mathewson**:

Q. Mr. Edgerton testified he would use cast iron pipe. Would that in your judgment be the pipe to use if you were to try that experiment?

A. I would not use cast iron.

Q. Why not?

A. Because the same thing might happen as you had at First Avenue and Forty-third street. If you laid a pipe of that kind you would have to use every precaution possible, and using cast iron pipe would not be taking any precaution.

Q. You are not familiar are you, with any city where the gas is delivered to consumers in the city by running the mains around through the city under twenty or thirty-pound pressure?

A. No, sir; I am not. Of course, I know of instances of gas being delivered to small country towns through small high-pressure mains and then reduced inside the towns.

Q. Would the danger in such a town as that, even if introduced into the town, be as great as in New York City where we have this congestion of traffic, buildings, etc.?

A. Certainly not. In New York there are houses every foot of the way. In the country work you might have a house every mile or sometimes every two miles.

5525 Q. Let me ask you generally, aside from the possibility of maintaining the pressure between two and one-half and one inches at every point and at every time under Mr. Edgerton's system, would you consider that a safe or wise system to install under the pressures indicated in the City of New York with the conditions here existing—under pressures of twenty or thirty pounds?

A. No, sir; I would not consider it safe or wise.

Mr. Mathewson: I think that is all.

Cross-examination by Mr. Kirby:

Q. I take it that your statement headed "In regard to Mr. E's suggested high-pressure mains" that the cost as computed by you is your idea as to how those mains should be put down, where put down and how connected?

A. No, sir; I took the route suggested by Mr. Edgerton in his testimony. He suggested a main on the east side of the city and the west side of the city, and I took the only available avenues on the east and west sides.

Q. That is, you used no figures given by Mr. Edgerton except at his suggestion that there would be a main on each side of the town?

A. I used the size suggested by Mr. Edgerton, 24, 20 and 16. Twenty-four to start with, reducing to 20 and 16, and the location suggested by him.

Q. But the joints and valves and excavation, and the repaving and all matters of that kind are figures in which you have used your own——

A. I informed myself on the actual cost of the pipe, actual cost of expansion joints, valves.

Q. And this statement includes entirely your own figures on those matters?

A. Yes, sir.

Q. I notice here you se- out for contingencies of all kinds 10 per cent. I find no mention in the statement of any amount for sheathing or blocking and wedges, or sheathing left in the trench or matters of that kind? 5526

A. No, sir.

Q. Is that included in the 10 per cent.?

A. Yes.

Q. You have spoken of a certain accident that happened to one of the mains in which a pressure was maintained of about two inches. That accident was from an external cause, entirely, was it not?

A. Yes, sir.

Q. Suppose instead of being about 1-14 part of a pound pressure there, there had been, say 14-14, or a full pound pressure, what do you consider the consequences would have been then?

A. They would have been very serious indeed.

Q. The windows would have probably been melted, would they not?

A. They would.

Q. The tenements would probably have been on fire, would they not?

A. Yes.

Q. And there would have been grave danger?

A. Yes, sir.

Q. If the happy circumstances you refer to had not existed there would have been far more danger, would there not? If your workmen had not been on the job and your superintendent in sight of the conflagration?

A. It would have taken longer to put the fire out.

Q. Are there any mains of the Consolidated Gas Company in the city where as high a pressure as one pound is maintained?

A. There is one main in the city where that pressure has been maintained.

Q. And that is maintained every day, is it not?

A. No, sir.

Q. How often?

A. For two or three hours a night, in winter time, and then it is only for a very short time.

Q. What do you mean by the winter time?

A. Well, the months, from say, the middle of November—the first of November till the 15th of February about.

5527 Q. Have you ever made any experiments at all directed toward finding out how gases under as high a pressure as twenty pounds would act if an effort were made to ignite them?

A. I have not.

Q. Mr. Edgerton, in his testimony relative to the installation of a high pressure system, made reference to governors?

A. Yes, sir.

Q. Did you allow for the installation of governors in your estimate of the cost of the system which I have referred to?

A. I think I did.

Q. Are you aware that a governor is constructed which, when the pressure becomes lower than a certain point, that the gas is automatically shut off?

A. Not automatically shut off. You mean the pressure is automatically reduced.

Q. Automatically shut off?

A. Reduced.

Q. Reduced, and, in some instances, automatically shut off if the governor is so adjusted?

A. You mean the gas is put out altogether.

Q. I do.

A. It would be a pretty poor governor, I should think. I wouldn't want to use such a governor.

Q. A governor could be, and many of them are so adjusted, that on the sudden releasing of pressure the gas would be automatically shut off or brought down to a merely nominal pressure, is that not the fact?

A. I really do not quite understand your question. Do you mean that if you are trying to govern a certain district, or a certain town, and reduce the pressure from high pressure to low pressure, is that what you are talking about? That is, bring the gas up to the town under high pressure and reduce it to low pressure after it has reached town?

Q. Well, that is one kind of governor. We will assume that we have installed this high pressure system and that we have at various points on the main a governor which is so adjusted that if
5528 the pressure on one side of that governor was suddenly reduced that the governor would automatically close so as to prevent any great flow of gas from that side of the governor where the pressure was reduced. Now, I ask if you are not aware that such governors are made and are in use?

A. Wouldn't it necessitate the use of two governors acting simultaneously, or one would only act on the end the gas was coming from?

Q. It might.

A. Well, I am not familiar with a governor of that kind at the present time.

Q. But such would not appear to be either impossible or unusual?

A. You mean to say if your main was working under a pressure of twenty pounds and that main was broken and the gas escaping that the governor would shut itself?

Q. That is what I mean.

A. I don't know of any such governor, no, sir.

Q. It does not appear an impossible proposition to you, does it?

A. It is an improbable proposition to me. I do not say it is impossible.

Q. In other words, you could not employ an automatic shut-off valve to a gas main?

A. A governor passing gas at twenty pounds pressure would have to be opened up to let the gas go through, and stay open.

Q. Well, I won't argue the point with you, Mr. Simpson, I think it is very plain.

A. Well, I would be glad to answer the question if I could understand what you are trying to get at. I certainly am not trying to evade the answer.

Q. You have presented here a statement showing the estimated cost of bridging. Did you include such cost in your first estimate of the value of the mains of the Consolidated Gas Company?

A. I did, sir.

Q. Under what items did you include it?

A. Divided it up among the items of labor and material.

5529 Q. Didn't state it specifically, did you?

A. No, sir.

Q. Did you include that of blocking and wedging?

A. I did, sir.

Q. Where did you include that?

A. The same way.

Q. Did you include that as sheathing?

A. I did.

Q. In the trench?

A. Yes, sir.

Q. And left in the trench?

A. Yes, sir.

Q. Where was that included?

A. The same way, labor and material.

Q. Taking for example your statement in reference to the blocking and wedges, do I take it from this that you consider that every foot and every size of pipe has to have a block placed thereunder and wedges inserted?

A. Not every size. Every size of pipe has to be blocked in some way. In the smaller sizes we have no blocking only wedges. In the larger sizes we use wedges on top of the blocking.

Q. All pipes laid in the city have blocks laid thereunder?

A. Yes, sir.

Q. None of them are laid directly on the soil?

A. I have never had pipes laid that way; wouldn't allow them to be laid that way.

Q. And that has been the invariable custom for the twenty years you have been connected with the company?

A. It is the invariable custom in the gas business in any city of any size for either gas pipes or water pipes.

Q. You have always done it here?

A. Yes, sir.

Q. Do you know whether or not the pipes which were laid prior to the time you became connected with the company were laid in that way?

A. I have not the slightest doubt they were.

Q. Do you know?

A. I do know.

Q. How do you know?

A. Because I have seen lots of them taken up and seen the blocking and wedges taken up.

5530 Q. And every bit of pipe laid in the City of New York has blocks laid under?

A. Not every foot, I allow for blocking every six feet, two blocks and two wedges to each length of pipe.

Q. Just explain that a little more fully. Two blocks and two wedges?

A. No, sir. One block and two wedges to every six feet of pipe.

Q. At what point on the pipe does that block come?

A. The first block would come back of the hub and the second block about the middle of the pipe, the middle of the length.

Q. So that in no instance would the pipe lay next to the ground?

A. Oh, yes sir, the pipe lays next to the ground, of course, the blocks are countersunk in the ground.

Q. Are you familiar with the pipes of the East River Gas Company?

A. The East River Gas Company? Yes, sir.

Q. Were they laid in this wise?

A. They were.

Q. Are you sure of that?

A. Certainly.

Q. Did you lay them?

A. I saw them laid.

Q. Are you familiar with the weights of pipe of that company?

A. The weights of pipe of the East River Company?

Q. Yes.

A. I am. I will say familiar, I know of the weights of them.

Q. Are they the weights which you have used in your estimate?

A. They are not there.

Q. That is part of the Consolidated Gas Company's system, is it not?

A. No, sir.

Q. In no part?

A. No, sir.

Q. Using none of the mains of the East River Gas Light Company?

A. No, sir; not one inch.

Q. A part of it?

A. No, sir.

Q. Those pipes are laid in the Borough of Manhattan, are they not?

A. Yes, sir. I would like to correct that statement, Mr. Kirby,
if I may. When I said they were using lighter pipe they
5530a used lighter pipe till the time I was in charge of their mains
and from that date on they have used the same weight of
pipe that we have used.

Q. It is a fact, is it not, that it used lighter pipe?

A. Lighter pipe; yes, sir.

Q. Is it not a fact that the weight of the three-inch pipe that they use is the same as that given by Mr. Edgerton, eleven pounds?

A. They haven't used any three-inch pipe.

Q. Is it not a fact that the weight of four-inch pipe they used was the same as that given by Mr. Edgerton?

A. No, sir.

Q. Is it not a fact that the weight of their four-inch pipe is eighteen pounds?

A. No, sir; their four-inch pipe runs nearly to nineteen, the same as ours.

Q. Then, if we have a report of the East River Gas Company appearing in the *American Gas Light Journal* for November, 1898, that it was eighteen pounds for four-inch pipe, the same would be correct, would it?

A. The report might be correct as far as the weight of pipe called for. They might have asked for eighteen and got eighteen and three-quarters, or eighteen and seven-eighths.

Q. A statement by the company that their four-inch pipe was of a weight of eighteen pounds and paid for such, would be correct?

A. I think so.

Q. Are you aware that their six-inch pipe is the same weight as that given by Mr. Edgerton?

A. It is the same weight given of the new pipe by Mr. Edgerton, thirty pounds; not the old, they never used it.

Q. And that their eight-inch pipe——

A. Eight inch runs forty-two pounds to the foot against our forty-four, or used to run, but does not now. I say they are using the same weights we used.

Q. Is it not a fact that their twelve-inch pipe has a weight of seventy-two pounds to the foot?

A. Against our seventy-three, yes.

5530*b* Q. And Mr. Edgertons' seventy-two for his new pipe?

A. Yes; one pound difference between that and ours.

Q. And that twelve-inch pipe weighs 148 pounds as against Mr. Edgerton's 150 for his new pipe?

A. Yes, sir.

Q. And that their thirty-six inch pipe weighs 360 as against Mr. Edgerton's 360 for both old and new?

A. Yes, I know that the thirty-six inch pipe they laid was entirely too light, and I commented upon it at the time and thought they would have serious trouble with it before they got through.

Q. Have they?

A. They have had quite a little trouble with the joints.

Q. What effect on the joints has the lightness of pipe?

A. None whatever.

Q. You are familiar with the firm of R. D. Wood & Company, of Philadelphia, are you not?

A. I know there is such a concern.

Q. Never bought pipe from them?

A. No, sir.

Q. Do you know whether or not they have furnished pipes to be laid in the City of New York?

A. I do know it.

Q. Are you familiar with the weights of such pipe?

A. They make pipes to all kinds of weight.

Q. Are you familiar with the weight of their pipe which has been laid in the City of New York?

A. I am not.

Q. You know that they have furnished pipe that has been laid in the City of New York down to three inches in the weight of eleven pounds?

A. No.

Q. And that they have furnished four-inch pipe in the weight of fifteen pounds?

A. No.

Q. Or furnished six inch pipe which would weigh twenty-five pounds?

A. No, sir.

Q. Or eight inch pipe which would weigh thirty-eight pounds?
A. No, sir.
Q. Or ten-inch pipe which would weigh fifty pounds?
A. No, sir.

530c Q. Or twelve inch pipe with a weight of fifty-eight pounds?
A. No, sir.
Q. Or sixteen inch pipe with a weight of 100 pounds?
A. No, sir.
Q. Or twenty inch pipe with a weight of 140 pounds?
A. No, sir.
Q. Or twenty-four inch pipe with a weight of 125 pounds?
A. No, sir.
Q. Or thirty inch pipe with a weight of 325 pounds?
A. No, sir.
Q. Or thirty-six inch pipe with a weight of four hundred pounds?
A. No, sir.
Q. All of the pipe of the Consolidated Gas Company has not been aid since you became connected with the company, has it?
A. No, sir. The greater part of it has.
Q. Where did you get your knowledge of the weight of such pipes s were in the ground when you came to the company?
A. From pipes taken up here and there belonging to all the contituent parts of the company.
Q. You have no direct knowledge of those weights, have you?
A. I have got direct knowledge of it for twenty-five years back.
Q. Many of the pipes were laid prior to that time, were they ot?
A. Some of them were, yes, sir.
Q. You have no direct knowledge of those weights, have you?
A. Except that I am familiar with the weights the other comnies used and always have been.

Mr. Mathewson: He was connected with one of the constituent mpanies, you know, long before the Consolidated was formed.
The Witness: The Municipal and the Knickerbocker.

30d Q. How long have you been familiar with the laying of pipes in the Borough of Manhattan, City of New York?
A. Twenty-five years.
Q. We have here your statement as to the cost of sheathing. It tes that such sheathing is necessary on 50 per cent. of the mileage, all pipes sixteen inches in diameter, and on sizes under sixteen ches, on 10 per cent. of the mileage.
A. Yes, sir.
Q. Has not the sheathing anything to do with the depth at which pipe is laid?
A. Yes, sir—not solely that, but it has partly to do with that.
Q. But your 50 per cent. is based upon the depth which you state Consolidated Gas Company pipes are laid, as well as the diameter it not?
A. The 50 per cent. is based on my knowledge of when sheathing

is necessary. It is not so often necessary with small sizes of pipe as it is with the larger sizes.

Q. And is not that true largely because of the fact that the largest sized pipes are laid deeper beneath the surface of the street than the smaller sizes?

A. The bottom of the trench, of course, is deeper than the smaller pipe.

Q. And is not that the reason?

A. One of the reasons; yes, sir.

Q. So if the trench were not as deep as that you have used, the percentage would be less?

A. It would depend entirely on the depth of the trench and the character of bank you are working in and the structures you are contending with alongside of your trench.

Q. Of course, you use no sheathing where there is a rock excavation, do you?

A. No, sir.

Adjourned at 5 p. m. to January 15th, 1907, at 11 a. m.

Last Complainant's Exhibit 294.
State's 000.
City's 137.

5531 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucian L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, *January* 15, 1907—11:00 a. m.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

5532 Colin C. Simpson resumed the stand, *as* further testified.

Cross-examination by Mr. Kirby (continued):

Q. Let us take up the method of laying mains such as the Consolidated uses in the city. You first remove the pavement, then dig your trench in the usual way, as to the general character of the earth or other material which you excavate. How deep do you go before you put in the sheathing?

A. You haven't started at the beginning. What size of main do you mean?

Q. Twelve-inch main, we will assume.

A. Twelve inch main on an avenue?

Q. On an avenue, yes.

A. I would apply for the permit first for doing that work, and then dig a big test hole along the line to see whether the main could be laid in that place. If it could not be laid there I would have to do one of two things—get the permit changed, if it could be changed, or else arrange for altering the structures which come in our way, or having the structures altered which come in our way.

Q. Now, we will assume that it is possible to put a main down in the avenue which we selected. What is the first physical act which is done?

A. The first physical act is, of course, to remove the pavement, whatever it is. Then excavate. As the excavating is going on, if it is necessary to sheath the sheathing is put in as the excavation progresses.

Q. When is it necessary to sheath?

A. It is necessary to sheath in almost every case in a deep trench.

Q. What do you mean by a deep trench?

A. Any trench over three feet six, to four feet deep.

Q. Is that so in all characters of soil?

5533 A. In New York City it is not safe to go beyond that depth without sheathing—in hardly a single instance.

Q. That does not hold true in rock, does it?

A. No.

Q. Now, we have our trench dug and sheathing put in in such cases as you have suggested——

A. I did not get through. With a shallow trench, if you have a main——

Q. What do you mean by that?

A. A trench two feet nine covered from the top of the pipe. A trench three feet deep even. If there is any sub-surface structure running parallel and close to our trench it is then necessary to sheath too, to take care of that structure. If we are running alongside or near a sewer, as is often the case when there are two sewers one on each side of the street, it is also necessary to sheath.

Q. Yes.

A. If any filled in soil is around, any bad or loose soil, it is always necessary to sheath with any kind of trench. Where the ground is filled in with broken rock it is also necessary to sheath.

Q. Now, we have our trench dug and what happens?

A. When the trench is dug?

Q. Do you make any efforts to level it up in any way?

A. Oh, yes; the bottom is leveled. If it is a main twelve-inch and above we put the pipe in, get the blocking in first and start laying the pipe. The pipes are put in, put together, yarn the joints and caulked.

Q. You spoke of putting the blocking in?

A. Yes, sir.

Q. Now, on what size pipes do you use blocking?

A. Anything above twelve inches.

Q. And where do you use it?

A. We use it back of the hub and midway——

Q. No, why? What is the object of blocking?

5534 A. It is not good practice in the gas business to put pipes in without blocking.

The Master: That is hardly an answer, Mr. Simpson.

The Witness: Well, it is considered necessary.

Q. Necessary for what?

A. Necessary for a support for the pipe.

Q. You have leveled up the bottom of your trench, have you not?

A. You have.

Q. Your pipe rests therein?

A. Yes.

Q. What object has the blocking then?

A. You can never level your trench as level as the pipe itself would be.

Q. Then it is for the purpose of leveling the pipe?

A. No; it is for the purpose of giving a firm support to the pipe.

Q. Does or does not your pipe rest on the bottom of the trench?

A. Can I make a little sketch explaining to you what I am getting at? That (indicating on a piece of paper) may be the bottom of the trench, but it may not be a straight line like that (indicating); it may be uneven. Now, there might be a little hump there and the pipe would rest on that, and would have no rest here and no rest there (indicating); that it, no rest at the ends; whereas, if there is a block there and a block there (indicating) and that is the hub there (indicating) the length of pipe rests on that, and the next block comes under the next length of pipe.

Q. So if your trench was dug so that the bottom would be level there would be no need of blocking?

A. If the trench were dug in good clean soil, and could be made absolutely level so the pipe would rest its entire length on that, blocking would not be necessary.

5535 Q. And the longer the length of pipe which rests upon a level surface the better support there is; is that not so?

A. Yes.

Q. And are you not aware that in practice, which is recommended by certain authorities, that the laying of pipe upon a trench without blocking is advised as against laying it upon blocking?

A. I have not heard of it.

Q. It would not surprise you to learn that many miles of pipe have been laid without blocking?

A. Not a bit. I would lay it in the country myself.

Q. Why would you if a trench was level?

A. If I could have ideal soil in New York I would not bother about blocking.

Q. What is the peculiar fact about the soil here which prevents you from getting the bottom of a trench level?

A. I do not suppose there is a cubic foot of ground in New York that has not been only dug over once but repeatedly dug over and over again, and in every street almost the character of the soil changes. You might have sand in one street, you have clay in another, you have got rock in another, you have got filled-in rock in another, you have got garbage filled in another.

Q. How does that in any way change the ability to level up the trench?

A. It forces us to make a rule that all pipe shall be blocked and not leave whether the pipe shall be blocked or not to the foreman who is doing the job.

Q. What size pipe do you lay by hand, and what size do you commence to use a derrick for?

A. Commence to use a derrick at 16 inch.

Q. Why do you use a derrick for that size?

A. Because it is easier to handle the pipe.

Q. And the number of men which would be necessary to lay a pipe of that size would be such as make it more expensive than if you used a derrick?

5536 A. It is cheaper to go to the expense of using the derrick and the derrick gang than it would be to try to put the pipe in without the derrick.

Q. What is the difference between the price of labor such as would be used in laying the pipe by hand and such as would be employed in using the derrick?

A. It would depend entirely upon the composition of the gang, a derrick gang. You take men at $2.00 or $2.25. The men in sheathing might get $1.25; some of them $2.00.

Q. Do you pay any of your men as low as $1.50?

A. No, sir. I stated $1.75. $1.90 is the least we pay.

Q. What did you mean when you spoke of $1.75?

A. Because some time ago we used to pay $1.75.

Q. As late as last July?

A. Yes, sir.

Q. When did you change to $1.90?

A. Two months ago, or about a month ago.

Q. In the statement which you made yesterday, in reference to the allowance for the cost of sheathing you state that in all pipes sixteen-inch diameter and larger, fifty per cent. of the mileage must be sheathed?

A. Yes, sir.

Q. And on sizes under sixteen inches, on ten per cent. of the mileage?

A. Yes, sir.

Q. Would you use under ordinary conditions sheathing on a trench for a pipe of six inches in diameter?

A. Under ordinary conditions?

Q. Yes.

A. It would depend upon what the conditions were.

Q. Straight laying?

A. It would depend entirely upon what the conditions were alongside of the trench. I might have to sheath if I went down only two feet with a six-inch pipe.

Q. But ordinarily you would not?

A. If there was nothing nearby I would not, or if the soil was perfectly good and safe.

5537 Q. In reference to the sheathing left in the trench, if you did have to sheath, for a shallow trench such as we have spoken of?

A. Yes, sir.

Q. Would you leave the sheath in that trench?

A. In some cases I would have to.

Q. In many cases?

A. Quite a few, yes.

Q. In as many cases as though the trench were a deep one?

A. No, probably not.

Q. As a matter of fact, most of the sheathing is left in deep trenches?

A. In deep trenches.

Q. Where it may be useful if an excavation is made at another time for repair or other purposes?

A. What do you mean by shallow and deep trenches? What do you refer to?

Q. Such as I made reference to, a trench of four and a half feet, or something of that kind.

A. I have testified on trenches two feet nine covered, and four feet to four feet six, and trenches where we go down seventeen or nineteen feet.

Q. Well, we will use a deep trench in the way you have used it. The deeper the trench, the more apt you would be to leave the sheathing in, would you not?

A. Yes, sir.

Q. You have presented a statement showing a comparison of the cost of laying and caulking pipes as given by Mr. Edgerton and as given by you?

A. Yes, sir.

Q. Your testimony being under the heading "of Consolidated Gas Company price?"

A. Yes, sir.

Q. In your testimony it also appears as to what your cost of laying is, exclusive of caulking?

A. I don't know that I gave any testimony exclusive of caulking.

Q. On page 312 of the record you testified and presented a table with reference to the cost of laying pipe. Will you explain what those figures include?

5538 A. Why, this one dollar and fourteen cents represents the entire value of labor and material for laying one and one-half inch pipe on a new pavement. That twenty-nine cents represents the entire cost for labor and material in laying one and one-half inch pipe under old pavement, and so on, all the way down. This column here is the entire cost of pipe, labor and material. That column (indicating) is for the old pavement, and that is for the new pavement (indicating another column).

Q. Including caulking?

A. Yes; except that ten per cent.

By Mr. MATHEWSON:

Q. Does that refer——

A. That refers to my big sheet.

Q. Has that the addition for the additional values of pipe and so forth, which you added at the end?

A. No, sir; that does not include the ten per cent. you know.

By Mr. KIRBY:

Q. What do you mean by your ten per cent.?

A. The ten per cent. for engineers and the cost of pipe as of December, 1905.

Q. What is the cost of pipe as of there in this statement on page 312 of the record?

A. October 31, 1905.

Mr. MATHEWSON: If you have his whole sheet there you can easily see it is the trench. I do not think you were here when it was put in. You will see he made these additions to the additional value of pipe and other things, following the schedule, and he subsequently testified that that did not, as it obviously did not, include all the expense.

5539 Mr. KIRBY: I understand the ten per cent. is not in there.

The WITNESS: And the cost of laying is not in there.

By Mr. MATHEWSON:

Q. Whatever was or was not in there you explained in your testimony?

A. Yes, sir.

By Mr. KIRBY:

Q. If, Mr. Simpson, you ascertained that the price of labor in some other city was the same as that which you have stated you would pay those engaged upon laying the pipe, would you expect that the cost of laying the pipe in that other city would be as great as that which you use here?

A. No, sir.

Q. You would not?

A. No, sir. I know it would not.

Q. Some more peculiar New York conditions?

A. Yes, sir. The proof of that is that I can lay mains cheaper in the Bronx than I can in Manhattan—also in Long Island City, and have been and am continually doing that.

Q. What is your cost of laying mains in the Bronx?

A. It will run probably—I cannot give you the exact figure offhand—but it will run anywhere from ten to twenty per cent. below in New York.

By Mr. MATHEWSON:

Q. Below Manhattan?

A. Below Manhattan.

By Mr. KIRBY:

Q. And you pay your labor as high there as in Manhattan?

A. Yes, sir.

Q. That is straight pipe laying?

A. Yes, sir.

5540 Q. You have made reference to the price of laying waterpipe. Is it not a fact that it generally costs more to lay water pipes than it does gas mains of the same diameter, the actual laying of the pipe?

A. Not one cent more.

Q. Is it not heavier?

A. Yes, sir.

Q. Does it not cost more to caulk it?

A. Not a bit more.

Q. Does it not have to be caulked for heavier pressures?

A. No, sir. It is not caulked for any more pressure than we caulk ours. In fact our pipe is more thoroughly caulked than a water pipe.

Q. Then that would infer negligence in caulking water pipe?

A. I am not criticising contractors or anything of that sort.

Q. Is it necessary to caulk gas mains better than water pipes?

A. It is necessary to put in the best work that can be put in.

Q. Is it not as necessary to put in the best work that can be put in on water mains?

Mr. Mathewson: That is a conclusion of this witness.

A. I should say yes, it is. It ought to be done.

Q. Water mains carry more pressure than your gas mains, do they not?

A. A great deal more pressure.

Q. And the trouble from pressure generally comes in the joints where there is caulking, does it not?

A. Yes, sir.

Q. The first thing that happens is that the caulking is blown out?

A. Rarely blown out. The joints will start leaking.

Q. Would leak at that point?

A. Yes. But you must remember that a leaking water joint will often "make up" of itself; it will rust up, whereas a leak-
5541 ing gas joint won't. When a gas joint starts to leak the gas iteslf lubricates the opening, and does not let it rust until it is recaulked again.

Q. And if the leak in the water main is sufficient to let the water flow that aggravates the leak so that in time we have a large flow of water rather than a small trickling which might rust up the joint?

A. Yes. If it is a strong leak it won't rust up the joint. If it is "bleeding" only it will rust up the joint.

Q. Water pipe certainly is not generally a heavier pipe than a gas pipe or main, is it?

A. Water pipes run slightly heavier in New York City than gas pipes, up to a size of twenty-four-inch. From twenty-four-inch up we use—under thirty-inch—thirty six and forty-eight, we use the same weight as water, but thirty-inch very nearly the same weight. The difference is so slight it would not make any difference in the handling at all.

Q. Would it surprise you to hear that the weight of water pipe laid in the City of Boston runs many pounds lighter per foot than that which you have given as being used by the Consolidated Gas Company for their gas mains?

A. You have got to tell me which water pipe. They use there five or six different weights. They have got four weights to my knowledge; four distinct weights.

Q. Would it surprise you to know, for instance in thirty-six-inch mains put down in the City of Boston to carry water, the weight thereof was 391.6 pounds as against your 425?

A. No, it would not surprise me at all.

Q. Nor that the weight of their thirty-inch was 290.2 against your 311 pounds?

A. No.

Q. Nor that the weight of their twenty-four-inch was 200.6 as against your 215?

A. On the lightest schedule of weights—they have four schedules of weight there, and when you get to the heaviest schedule it 5542 is the heaviest pipe used for water pipe, I think, in this country to-day; the top weight.

Q. But these weights to which I have made reference are not such as used here? These are weights that are used in Boston, are they not?

A. I would not be surprised. I do not know positively. I know they have four weights, four scales of weights, and they use each scale under different conditions.

Q. And would it or would it not surprise you to know that these pipes to which I have made reference are designed to carry a pressure of over forty pounds?

A. It would not surprise me a bit. The pipes that I have there—our pipes are tested to a pressure of over one hundred and fifty pounds to a square inch. We do not have to deal with internal pressures at all; it is the external pressures we are looking out for.

Q. If it were that the report of a certain committee to which we have already made reference in the previous testimony, being the report of the Board of Division, relative to the distribution of gas, made to the American Gas Institute of Chicago, in 1906——

Mr. Mathewson: When has he referred to that?

Mr. Kirby: You referred to it and I referred to it when Mr. Edgerton was on the stand.

Mr. Mathewson: Oh, yes. This witness has not referred to it.

Mr. Kirby: I said the previous testimony.

Q. (Continuing.) Giving a weight of lead for joints and gas pipes, such as those used by Mr. Edgerton, would you be inclined to change your opinion that Mr. Edgerton had not used sufficient weight of lead?

A. No, sir; I would not.

5543 Q. Nor if the water pipes to which I have made reference in Boston used less lead for their joints than that which you have used for the joints of the pipes of the Consolidated Company?

A. Would it change my opinion?

Q. Would that in any way change your opinion?

A. No, sir; it would not.

Q. I think you stated yesterday that the cause of the breakage was generally from external causes?

A. External.

Q. Rather than from any internal pressure?

A. Yes.

Q. And that I presume might be the pressure of the weight of the earth or such material as was on top of the pipe?

A. Yes.

Q. By reason of the breakage in a water main the earth was sifting out underneath, or something of that sort?

A. Yes. In the water mains that I have seen break, it has been due to the pipe being improperly blocked.

Q. Now, there is some wrought iron gas pipe or main in this city?

A. Yes, sir.

Q. Not all cast iron?

A. No, sir. We haven't any of it.

Q. The Standard, I think, use wrought iron?

A. The Standard is all wrought iron, ten-inch and below.

Q. Your statement in reference to the necessity for bridging in the laying of pipe is one which you applied anywhere where there is traffic either by pedestrians or vehicles?

A. It would only apply to a city similar to New York, where you have got a crosstown street every two hundred feet.

Q. Well, you wouldn't need as much in a country village, but I suppose you would need some?

A. It depends on whether they would allow you in a country village to block the street and have the people go around the
5544 other way. You cannot do that in New York.

Q. It is a question of the people's desires?

A. It is a question of the demands of the city authorities.

Mr. MATHEWSON: This is a city regulation. We cannot help that.

Q. You have said that you have never made sales of rock taken from the trenches?

A. Yes, sir.

Q. Have you never sold rock or earth taken from the trenches for the purpose of fill?

A. I only know of one case of rock being sold in New York City in connection with any of our work, and that was in excavating for a new holder at 63rd Street and Avenue A. We had some good rock there, and some of it was sold at fifty cents a load, but never in connection with main work.

Q. Is it not the custom of contractors in the city when they are excavating a cellar or for other underground purposes, to make sale of the earth or rock excavated for use as fill in low lying lots?

A. No. The man who has got low lying lots to fill will always demand from fifty cents up per yard for dumping privileges.

Q. And you know of no instance?

A. I know of no instance in all my experience where one cubic foot of rock has been sold from trench work. I never heard of it.

Q. Now, the price which the owner of a low lying lot would charge for the privilege of dumping thereon is much less than that which you would have to pay for the dumping from a dock?

A. We have often paid a little more in low lying lots, because it was cheaper on account of saving a long haul to the dump. We
might have to pay fifty cents at the dump and it would cost
5545 fifty cents to cart, and if we get a low lying lot owner it would
cost us perhaps sixty cents to dump and maybe not more than
twenty cents to cart.

Q. Now, coming to this rammer, which you made reference to yesterday, and which has a circular end about six inches in diameter——

A. Five and three quarters.

Q. Five and three-quarters, to be exact. You do not pretend that you ram down the earth on the lower section of the main as it lays in the trench, do you, with this?

A. No, sir.

Q. That is only for pressing or pounding down the earth which is left in the main on top of the pipe?

A. We use the tamping bar—we use the rammer after we are through with the tamping bar.

Q. Which is this?

A. This is the rammer. The tamping bar is used first.

Q. In cutting your trenches, do you give them that width which is necessary to care for the caulking of the bell, or do you make a larger opening at that point?

A. We do not use bell holes in work in New York City, and especially on avenues. There are so many drip pots and different fittings to go in, that we have the trench wide enough to do the caulking without allowing for bell holes.

Q. And that enables you to take off the many other connections you have to from the mains, without making additional width of trench for that purpose?

A. You mean for the service connections?

Q. Yes.

A. Yes, sir.

Q. Now, referring to these drawings, showing cross sections of various streets and taking, just for example, Complainant's Exhibit 288, being Broadway, at Morris Street, looking north, I note here a section marked 31, which I take it is of the Subway?

A. It is of the Rapid Transit Subway.

Q. And between the top of the subway and the surface of
5546 the street I note two circular sections, marked 7 and 9, which
in the reference index it states are "gas mains?"

A. Yes, sir.

Q. I also notice a section of a pipe lying almost to the bottom of the subway, marked *l*, and in the reference index being marked as a "sewer?"

A. Yes, sir.

Q. The gas company's mains did not in those instances go under that sewer, did they?

A. No, sir.

Q. Are the mains in their present position the same as before the subway was built?

A. No, sir. That whole thing was rearranged when the subway was built, rearranged by the contractors for the subway.

Q. And at their expense?

A. At their expense.

Q. Taking, as another example, Complainant's Exhibit 289, Sixth Avenue and 14th Street, looking north, I notice a section marked 7, which on reference to the key I see is "Consolidated Company's gas mains"?

A. Yes, sir.

Q. I notice in the middle of what I take to be Sixth Avenue a section marked 19, which by reference to the key I see is a "four-foot sewer?"

A. Yes, sir.

Q. I think I am right in tracing this gas main so that the same runs over the sewer, do I not?

A. Yes, sir. But you can see if a main were carried out on a straight line it would come to the middle of the sewer. We do not go under a sewer where it is possible to go over it.

Q. There is no doubt about that. Now, in many of these cross sections, these drawings, in fact, in almost all of them, I notice either cross sections of the Rapid Transit subway or conduits for the Metropolitan Street Railway system, or pillars, that is the foundations for the support of the elevated railroad columns; I take it that 5547 neither the subway nor the conduits for the street railway system were built prior to the time when most of the mains of the Consolidated were in the ground, and your mains had to be removed when these structures were built; is that a fact or isn't it a fact?

A. It is a fact.

Q. And when they were removed it was at the expense of the contractor of the company putting in the subway or the railroad?

A. Yes, sir.

Q. You have placed in evidence certain photographs and made a statement relative to the size of various openings, which you have measured, and which you have stated were made for the purpose of putting down some of the mains for the new salt water system?

A. Yes, sir.

Q. Taking up the first of these, Third Avenue and 14th Street, west side, the width of cut is given as nine feet, whilst the size of the main is but twenty-four inches?

A. Yes, sir.

Q. You do not contend that in laying the twenty-four inch mains that a cut to the width of nine feet would be necessary, do you?

A. It was in that case.

Q. At this specific point?

A. Yes, sir. You can see down the entire block there. It is all the same; in fact, it goes from 14th way down to 11th Street the same way.

Q. Well, I cannot see very far, and in the little distance I see it very soon becomes much shallower, right under the truck, which is marked with the name of a roofing company. I think it is considerably narrower.

A. It may look narrower, but it is the same width all the way down. I went over it all the way and picked out a typical part. I did not pick out an extreme part or a narrow part; just an average part.

Q. Did you find any parts of that trench which were less than nine feet?

5548 A. There were parts which might have been less than nine feet, but there were many places where it was over nine feet.

Q. And if you had continued you might have found trenches for the twenty-four inch main which were considerably less than nine feet?

A. I didn't find any.

Q. Did you go to any of the places pointed out by Mr. Edgerton as having the width of trench which he testified to?

A. No, sir.

Q. You have no reason to believe that the trenches were not the width he indicated, have you?

A. I don't believe that it would show the trench that had to be repaved that he indicated. It might have been the trench that the contractor dug, and in that case I have given the maximum, which shows the trench might be two feet wide on the job, and yet the contractor might have to pay for six feet of paving before he gets through. I mean in those two photographs I presented.

Q. So these photographs in this detail simply have reference to the paving which has to be done, and not to the width of trench which would have to be dug to instal the main?

A. Oh, I beg your pardon, it refers to the width of the trench.

Q. Are you prepared to state that this trench at Third Avenue and 14th Street, Complainant's Exhibit 271, was dug nine feet wide?

A. Yes, sir.

Q. For the purpose of putting the twenty-four inch pipe therein?

A. Yes, sir.

Q. Did you see that trench when it was open?

A. I did, sir.

Q. And what was the condition of the excavation?

A. There were two or three mains in the way that had to be moved, and in moving those mains it was necessary to make a wide trench. Just what I have been testifying to; you cannot find a *palce* in New York where you can dig down where you do not have to widen your trench out.

5549 Q. And that is the reason these are all wide?

A. Yes, wherever they go down they have to move subsurface structures, and therefore must have a wide trench.

Q. If it happened the entire street were filled with mains, and you for some reason desired or it was necessary for you to put your main in the position occupied by some one of those, it might be the entire street would have to be ripped open so as to move them around to fit yours in?

A. It might be, yes. In fact, it was so on some of the avenues where the Rapid Transit went, that they could not have rearranged the pipe system unless they had the whole thing open.

Q. You have stated these are all for salt water mains?

A. All salt water mains.

Q. Will you show me any one of them that is in the middle of the street?

A. I don't know whether I can show you one of those, but I have got some of the others that are in the middle of the street. I have got some photographs taken.

Mr. Mathewson: There is one down the middle of the street.

Mr. Kirby: I am asking as to these which are in evidence, and he shows me the one marked Fifth Avenue, Complainant's Exhibit 280, and that is the one which is nearest the middle of the street of the photographs which have been marked in evidence.

The Witness: Yes, sir.

Q. Is it not a fact that in putting down the salt water system this happened in many instances, that the streets have not had the pavement removed for a considerable period after the trench had been filled in?

A. The pavement removed?

5550 Q. The pavement replaced?

A. Yes, sir; in a great many cases.

Q. And that, I think you have already testified, has resulted in the edge of the asphalt, or whatever the pavement is, being worn or so that the necessity of replacing a larger width has occurred, where, if the asphalting had been done at once, the width would have been less?

A. Yes, sir.

Q. You made reference to the laying of certain large mains, I think it was on 126th Street?

A. Yes, sir.

Q. Do you know how long it took to lay that main?

A. How long it took? Well, you mean from the commencement of the work to the finish of the work?

Q. Yes.

A. It took practically, as I remember now, I should say, about three or four months, the greater part of the summer.

Q. And do you know how long it was after that trench was filled that it was repaved?

A. I don't exactly remember. I know it would not have been very long, because we do not allow a trench to remain unpaved very long.

Q. Do you do your own paving?

A. No, sir.

Mr. Mathewson: He refers to the temporary pavement we have to put over the trench.

Q. Do you put a temporary pavement over the trench?

A. Yes, sir.

Q. I do not have reference to that. I mean the replacing of the asphalt so the street would be in the condition it was in before you put down your main. Have you control over that?

A. Yes, sir.

Q. And what control is it that you have over it?

A. We send to the Asphalt Company that has the contract for the street, and if they do not come at the time we send for them again and look them up again.

5551 Q. And they charge you for the actual area replaced?

A. Yes, sir.

Q. Are you familiar with the character of pipe which is put down for the salt water system?

A. Yes, sir.

Q. What kind of pipe is it?

A. Cast iron.

Q. What kind of joints?

A. Hub and spigot.

Q. How is it caulked?

A. The same as gas pipe is caulked.

Q. It is laid by contract, is it not?

A. Yes, sir.

Q. Do you lay most of your mains by contract?

A. No, sir.

Q. Do the work yourself?

A. Yes, sir. The only mains we ever laid by contract since consolidation are the larger sizes, 30's and 36's, and 24's and one 20 inch.

Q. You have spoken of the price of lead, Mr. Simpson; is it not the fact that the price of lead varies often and greatly.

A. I don't know whether you call it varying, it is going up all the time; it never seems to go down.

Q. It has been higher than it is to-day, has it not?

A. Well, it might have.

Q. Was it not higher within the past six months than it is to-day?

A. I do not think so.

Q. Have you any record, Mr. Simpson, showing the actual depth of all your mains?

A. Yes, sir.

Q. Have you ever figured out the average depth of those mains for the different sizes of pipe?

Mr. MATHEWSON: You mean below the top of the pavement.

Mr. KIRBY: Below the top of the pavement.

A. I have had no need to figure; I have known it all along. I have seen them all, or practically all, and have been for so many years familiar with them that I know it without figuring it out.

5552 Q. And so when you give that depth, you refer to the ordinary laying of that main or pipe, and not to such instances where it would have to go over or under, or around obstructions?

A. I am referring to an average depth. There are, of course, many cases where the mains are far deeper than the average of two feet nine inches, and many cases where the mains are less than the average of two feet nine inches.

Q. So when you say two feet nine inches you take into consideration those cases where a main may have had to go under a sewer at a corner?

A. Yes, sir.

Q. Or where it had to be dropped under a subway or something of that kind?

A. Yes, sir.

Q. And if that were twenty or thirty feet it might happen?

A. Yes, sir.

Q. Of course, it would make the average depth considerably more?

A. It would come in the average of two feet nine inches that I gave.

Q. If I understood your testimony correctly, you stated that you had examined some 90 per cent. of the mains, not only of the Consolidated Gas Company, but of the other gas companies in the Borough of Manhattan?

A. Yes, sir.

Q. I understood you correctly?

A. Yes, sir.

Mr. Mathewson: He said he had seen them.

Q. Or seen them, or inspected them?

A. Yes. They followed the same practice we did.

Q. Do you know how many miles of mains there are of the Consolidated Gas Company and these other companies?

A. Yes, sir.

Q. How many miles are there?

A. In Manhattan?

Q. In Manhattan?

A. In rough figures fifteen hundred, a little over fifteen hundred.

5553 Q. Do you mean by that active mains, or mains in the street?

A. Active mains.

Q. Corresponding to the 795 or whatever figure it is?

A. That fifteen hundred miles, of course, includes the twenty-seven miles of disused mains we have; it is fifteen hundred and some odd miles; I can give you that exactly.

By Mr. Mathewson:

Q. That means excluding abandoned mains?

A. That means excluding abandoned mains.

By Mr. Kirby:

Q. But including the 27 miles of disused mains of the Consolidated Gas Company?

A. Yes, sir.

Q. You having to-day 795 miles of active mains?

A. Yes, sir.

Q. Mains actually in use?

A. Yes, sir.

Q. Have you ever laid your mains under the side walks in the uptown district?

A. No, sir. I have never laid them, but up until 19 years ago the City did not allow any gas main or water main to be laid under a macadamized street and in every case they would compel us to go under the sidewalks, so up to some years ago we had quite a few streets where the mains were under the sidewalks. At the present time the only streets they are under the sidewalks for any length at all are on 72nd Street on the west side, 72nd Street on the east side, 124th Street between Mt. Morris Park and Third Avenue and part of 110th Street, and in Broadway they have been taken out and laid in the middle of the street. That is about all; and a short stretch on 116th Street, between Third and Fourth Avenue.

By Mr. MATHEWSON:

Q. Did you mean laid in the middle of the street or under
5554 the sidewalk on Broadway?

A. They used to be under the sidewalk, but they are now in the street.

Q. You do not mean they are in the middle of the street?

A. No.

Q. Because the trolley cars are in the middle?

A. Yes. We have a small one in the middle of the street on Broadway, to supply the lamps.

Q. That is upper Broadway?

A. Upper Broadway, yes.

By Mr. KIRBY:

Q. Can you give us approximately the mileage of your mains, or rather the number of thousand feet of your mains which go under sewer or other deep conduits in the street?

A. No, sir, I could not. It would not amount to very much in mileage, because where we have to go down we come up again as soon as we can.

Q. Are those instances many?

A. They are getting more every day; I think you will find in my testimony I have testified that at the present time we are unable to cross avenues with any large size pipe without going down very deep.

Q. Those instances would likely be impressed upon your memory, would they not, where you have had to go down?

A. Yes, sir; some of them.

Q. Now, in your estimate for excavating and other operations which go into the laying, you have figured that on the average depth of trench which you have used, have you not?

A. Yes.

Q. And that is true of excavation for such deep holes as might have to be made to carry your gas mains under sewers and the other obstructions?

A. In connection with the larger sizes?

Q. Yes.

A. Yes, sir.

5555 Q. Am I not right in assuming that at such point the cost of excavation is very heavy and the deeper down you go the greater the cost?

A. Yes, sir.

Q. And more handling of dirt and rock and such things?

A. Yes, sir.

Q. Taking up the troubles which you have referred to occurring in your stand-pipes or risers or street lamps during cold weather, will you tell me what is the cause of trouble in gas pipes when cold weather comes?

A. What is the cause of trouble?

Q. Yes, what does the cold do?

A. The cold, well the actual visible trouble is a formation of what looks like hoar frost inside the pipes, and if the cold continues this hoar frost gradually works towards the center and at last closes the pipe up altogether.

Q. And what enables that hoar frost to form?

A. What enables it to form?

Q. Yes, outside of cold. Is it moisture contained in the gas?

A. I suppose it is moisture in the gas.

Q. Could it be anything else but moisture?

A. I do not think so.

Q. It is not an unusual and uncommon hoar frost, it is the same as that which you would find where there is moisture present and cold comes in contact with it?

A. Yes, sir.

Q. If there were no moisture present are you of the opinion that there would still be hoarfrost formed in these pipes?

A. I do not think I am competent to answer on that; I am not much of a chemist.

Q. It would seem reasonable to you, would it not?

A. Any answer I would give you would be pure guessing.

Mr. Mathewson: He is not a chemist and is not a manufacturer of the gas. He simply observed conditions.

5556 Mr. Kirby: It is not a question of chemistry.

Q. Do you have this trouble from the stoppage of flow of gas, which it ultimately amounts to, I presume, at the time of great cold, or at the time of a thaw immediately after a cold spell?

A. We have it—the trouble you are talking about we have at the time of great cold. There is another trouble develops at the time of thawing which is another trouble altogether.

Q. What is that trouble?

A. The trouble at the time of the thaw is with this condensation or I mean this hoarfrost thawing out, and if the pipe is at all trapped, collecting in the trap of the pipe and sealing the gas off. There might be enough hoarfrost form in the pipe to seal a trap in the pipe, and yet it might not be formed all the way to the center, so as not to let the gas*t* through, so we find that in hundreds of cases.

Q. Do you ever find your risers frozen solid at about a point where they leave the earth?

A. Frozen solid?

Q. Yes. After a thaw, that is, does the hoarfrost ever develop, and water run down, and striking the cold earth, freeze at that point?

A. No, sir.

Q. Then the trouble during a thaw is when it comes from a trap filling up and in a way choking up——

A. Sealing off the gas.

Q. What happens to these——

By Mr. **Mathewson**:

Q. Would not an elbow effect the same result, or I suppose any sort of a bend?

A. No, the pipe has got to be trapped, you know. If there is a fall all the way back to the main, of course it would not stay there. The best evidence of that, you know, we pour in alcohol in the
5557 lamp stand pipes to thaw the hoarfrost out and it runs back into the main.

By Mr. **Kirby**:

Q. Do you use alcohol to remedy trouble of this kind?

A. Wood alcohol.

Q. You do not use anything else?

A. If the wood alcohol does not work, we use a rod very often.

Q. Never use salt water?

A. No.

Q. What happens? You have spoken of these traps, as I understand it, if at various points along the main there is a trap placed for the collection of moisture which precipitates in the service pipes or in the mains, it flows back to the main, which has a slight dip and which will carry it back to the trap; am I right?

A. No, the traps are things which should not be there; we don't know of them until this thing happens and the service pipe seals off or the lamp seals off after a frost. We know there is some stoppage or that these traps are sealed with water.

Q. You do not mean an intentional trap?

A. No.

Q. But by reason——

A. Of the settlement of the ground or something, a trap is developed in the pipe.

Q. Do you have intentional traps in various parts of your distributing system?

A. We have drip pots on our main system and in some cases where it is impossible to have the service drip back to the mains there are house drips, as we call them, in the house.

Q. What is the purpose of these drip pots?

A. To take care of the moisture in the gas, the condensation.

Q. What happens to the contents of these drip pots in cold weather?

A. Nothing happens to them.

Q. They are pumped out?

A. We pump the drips summer and winter. Men are
5558 going around all the time pumping them out. The house drips are taken care of by shopmen who go around and empty them. They have records of them and take care of them.

Q. And this is done through all the months of the year?

A. Yes, sir.

Q. They do not freeze up in the winter so they can not be pumped?

A. I have known cases of their freezing up, certainly.

Q. But it is an exception and not the rule?

A. The exception.

Q. Now, have you a record in your department showing the number of complaints or troubles of street lights which are out during the various months of the year?

A. Well, we have—it could be got up in some way, I suppose. We do not keep any separate account of the number that are out.

Q. Can you tell the number of street lights which were out and the number of hours thereof during the month of January, 1904 and also the month of January, 1905?

A. We could find it out easy enough.

Q. You have not that data at hand?

A. I have not that data at hand.

Q. Nor a comparison for any other two months?

A. No, sir.

Q. Mr. Simpson, in measuring the distances as laid down on these insurance maps which your company uses to plot your mains upon, didn't you measure from, say, the corner of an avenue and one street to the corner of another avenue and another street distant several blocks therefrom, or did you only measure the length of the block from one corner to the next corner without crossing the street?

A. I took several kinds of measurement. Some cases I measured across the entire page and took the difference as given by Mr. Marks from point to point, as given by him on this sheet, and I compared that with the official record. In other cases I took just single blocks also as given by him. 5559

Q. And did you find these maps were correct in the width of their streets?

A. I did not measure it at all to see if they were the correct measurements of the street.

Q. You have made certain criticisms of Dr. Marks' statement of distances, using as an illustration a length of pipe running around a block and s-ating, very properly, that if that pipe is distant six feet from the curb, it is greater in length than one which is only distant three feet from the curb. As a matter of fact, pipes are not laid in that way, are they? They are running in straight lines down an avenue or across a street?

A. Either I do not understand you, or you did not understand me. I said that wherever the pipe ended at an intersection or a street, that in every such case his measurement must be wrong, because that pipe, neither on the avenue nor on the street was put down to scale.

Q. Have you many pipes which simply run a block or two blocks?

A. Do you mean many pipes that end at a certain point, like I am talking about?

Q. Yes.

A. Thousands. You can see them at one glance at the volumes; there is not a page where you will not find several instances.

Q. Did you calculate the number of feet which instances of that kind would make?

A. No, I took a few instances and the actual distance from the curb, and the distance as given apparently in the volume.

Q. It would make only a very few feet on each block, would it not?

A. It might amount to—it depends entirely on how that is laid down on the map and how far it is from the curb.

Q. It could not amount to more than the distance of the mains as actually in the ground, that is the distance from the curb 5560 as the main is actually laid, and the distance from the curb as assumed by Dr. Marks?

A. It would amount to this difference, that if his volume shows that main ending at three feet from the house line and, as a matter of fact, that main were ten feet from the curb, as they frequently are, it would make a difference of ten feet less three, plus the width of the sidewalk, in every case.

Q. And instances where pipes are laid in that way, compared with the total length of pipe in the city, are very small, are they not?

A. The cases that I am talking of—are you talking about the number of instances of that kind?

Q. Yes.

A. As I said before, there are thousands of them in those volumes.

Q. The number of instances brought down to the number of feet of pipe represented by those instances?

A. What the difference would be I could not say. It would be a tremendous calculation. It might amount to hundreds of thousands of feet, and might only amount to a few thousands.

Mr. KIRBY: That is all I have to ask Mr. Simpson.

The MASTER: Mr. Burr: You may cross-examine.

Cross-examined by Mr. BURR:

Q. Referring, Mr. Simpson, to Complainant's Exhibit 286, and the other purporting to be a diagram showing the situation at various points regarding the number of sub-structures in the streets, are you sure the scale of feet as given here is correct?

A. I will not say that I am sure.

Q. But I think you said yesterday that from your own knowledge you knew of the situation at various points described on these diagrams?

A. I said from my own knowledge I knew of the situation 5561 in a general way. I *and* not familiar with every detail of it, of course.

Q. Are you quite sure there are thirteen gas mains at Broadway and Bleecker Street, as appears on this exhibit, Complainant's Exhibit No. 286?

A. That is counting the mains on Bleecker Street and the mains on Broadway?

Q. I am speaking of the situation of the locality as it appears on that diagram?

A. This shows the mains on Bleecker Street and the mains on Broadway.

Q. Well, do they not number thirteen?

A. They evidently do, thirteen, yes, sir.

Q. Some of those are the mains of the old companies that existed as long ago as 1823?

A. I doubt it very much.

Q. Well, take the Mutual, how long has those mains been in the ground?

A. The Mutual dates back about, I think, to 1872.

Q. And the Equitable?

A. The Equitable dates from 1883; they started laying mains then.

Q. Can you give the sizes of the mains at that point?

A. Do you want me to call off the sizes?

Q. Yes.

A. One four-inch, seven six-inch, and five eight-inch.

Q. The column headed "Reference" on each of these diagrams is explanatory of the location of the various mains, and so far as the gas mains are concerned, to your knowledge it states accurately the size of the mains?

A. Yes, sir.

Q. What points in the street are there to your knowledge and from your experience where there are a greater number of gas mains converging than thirteen?

Mr. MATHEWSON: At a single corner, I suppose?

Mr. BURR: I said converging at a single point.

5562 A. You mean taking a street and avenue together?

Q. Yes.

A. Third Avenue and Forty-second Street.

Q. How many on Third Avenue and how many on Forty-second Street at that point?

A. Ten on Third Avenue—nine on Third Avenue and seven on Forty-second Street.

Q. That is sixteen at that point?

A. Yes, sir.

Q. How many of those were laid, if you know, since the subway was built?

A. The Rapid Transit Subway?

Q. Yes.

A. None.

Mr. MATHEWSON: That does not go to Third Avenue.

Q. There is no subway at that point, is there?

A. No.

Q. How many of them have been in the street at that point since 1865?

A. In 1865 there would be two on the street and two on the avenue.

Q. What size were those mains?

A. There was a Metropolitan twenty-inch on Forty-second Street—there was at that date; of course, it has been changed since that time; and a Metropolitan four and a Metropolitan six on the avenue and a Metropolitan on the north side of Forty-second Street at that time; that is in 1865.

Q. Yes. Now, when the frost penetrates into the ground say four feet, does it in addition to affecting the mains affect the services?

A. Yes, sir.

Q. How far——

A. I won't say in addition, because I have never yet known of a case of a main being what you might call affected by the frost, not stopped or anything.

Q. A main is not affected?

A. No, sir.

5563 Q. I understood you to say that hoarfrost gathers about it. Were you speaking of pipes and not mains?

A. Yes, sir, service pipes. Of course, if the cold snap is prolonged enough it would eventually stop up a main, too, I suppose, if it kept on; I don't know. In the case of the smaller services it stops up.

Q. The service pipe runs from the main through the building line to the house?

A. Yes.

Q. How much inside of the building line does the service pipe run?

A. We run generally three feet.

Q. That then connects with the meter?

A. Yes.

Q. And I suppose that the effect of the frost is felt outside the building line and not inside of it?

A. It is felt inside the building line if the pipe is not protected, or if it is exposed to cold weather.

Q. After you put the service pipe in you never take it out, do you?

A. After we put the service pipe in we never take it out?

Q. Yes.

A. Yes, very often.

Q. For what purpose?

A. If the service shows any signs of wear we put new pipes in, or they might want a larger pipe, and we take it out and put in a larger one.

Q. But you do not take it out because a man changes from gas to electricity, do you?

A. No.

Q. It is practically left there forever, as long as it is serviceable?

A. Yes, sir.

Q. When did you first see the maps to which reference has been made, and from which Dr. Marks took his measurements?

A. When did I first see them?

Q. Yes.

A. In 1889.

Q. Had there been a series of maps in existence before that time?

A. Yes, sir.

Q. What became of those maps?

A. I could not say.

Q. Do you know why new maps were procured?

A. Yes, sir.

5564 Q. Why?

A. I took charge as general superintendent of mains and the system of maps they had then was a separate map for each of the old companies, comprising the Consolidated Gas Company, and I thought it better to have them in this form that we have them now.

Q. And then these maps were made under your supervision?

A. Yes, sir.

Q. And of course you intended that they should be as accurate as it was possible to make them?

A. As far as printed to scale is concerned.

Q. In every respect?

A. No, sir, I intended——

Q. You did not——

Mr. Mathewson: Let him finish his answer.

The Witness: I intended them to be accurate as showing our main system by the size and the streets on which we had mains, but did not make any attempt or give any orders that the mains should be put on there to scale, or for them to adhere to the right distance from the curb.

Q. Did you give positive orders not to do that?

A. No, I did not.

Q. Whom did you employe to make those maps?

A. One of my draughtsmen, a man named St. Aubyn who is now in Philadelphia.

Q. How long were they engaged in making the maps?

A. It took him, I should say, about seven or eight months.

Q. How many maps are there altogether?

A. Eleven in Manhattan and the Bronx—twelve.

Q. That is, twelve volumes of maps?

A. Twelve volumes, yes, sir.

Q. How many individual maps are there?

A. Oh, I don't know, I never counted them.

Q. Three hundred or fifty or four hundred?

5565 A. No, there must be — thousand, I should think, must there not?

Q. You remember when Dr. Marks testified here and had marked for identification the maps of mains or schedule of mains which he prepared from your maps, as he testified?

A. Yes.

Q. And immediately thereupon a copy of that schedule of mains was handed to you through Mr. Mathewson?

A. No, sir. I have never seen anything but that schedule which we had in court here.

Q. That is what I am speaking of.

Mr. Mathewson: That is Exhibits 92 to 103?

The WITNESS: It was never handed to me at all. I sent down here and asked Mr. Mathewson if I could look through them and check them up, and I sent down here for them.

Q. And you got them?

A. Yes, sir.

Mr. MATHEWSON: But he did not get them immediately after they were in. I think it was when we adjourned before Christmas. I have had them, there is no doubt about that, and I have had them here for cross-examination of witnesses, but you asked him if he got them as soon as they were put in, and I say he did not and he says he did not.

Q. How soon did you get them after they were put in?

A. It might be two days, possibly three days.

Q. How long were you engaged in comparing them with the maps in your possession?

A. How long?

Q. Yes.

A. Well, off and on ever since.

Q. That is about how long, a month?

A. Well, some days we did not do anything with them at
5563 all and other days we did; I couldn't give the exact time.

Q. Well, it is about a month since you received them?

A. I suppose it is about that.

Q. And you have been engaged in comparing the schedules as prepared by Dr. Marks with the actual maps in your possession off and on ever since, as I understand you?

A. Off and on, yes; not continuously.

Q. And I understood you to say yesterday, at that, you had only succeeded in comparing about 20 per cent. of the schedules made by Dr. Marks?

A. That is all.

Mr. MATHEWSON: He said he had compared 20 per cent., not that he had succeeded only in comparing 20 per cent.

Q. That is the point, that although you tried to do more, it was all you were able to do?

A. No.

Mr. MATHEWSON: He did not testify that at all.

The WITNESS: I only did what I wanted to do. I looked to see what kind of errors were made, and when I found a bunch of errors on something, I stopped on that and went to some other kind.

Q. Have you read the testimony of Dr. Marks at all in regard to these maps?

A. Yes.

Q. Do you recall his testifying that before the maps were measured that the scale was proven?

A. I remember his testifying something about the scale; just what it was I don't remember.

Q. Have you got a volume of the maps here?

A. Yes, sir.

Q. Will you produce volume 6?

5567 Mr. MATHEWSON: Dr. Marks expressly testified that the scale was not proven, and that he did not test it by any official maps at all.

(Volume produced by the witness.)

Q. Take the map—what does this 111 mean?

A. Page 111.

Q. What does 107 mean?

A. No, that means 111 is a continuation of that.

Q. This is page 107, volume 6 of the maps?

A. Yes.

Q. Where does the scale appear?

A. Here (indicating).

Q. Will you measure it?

A. Measure the scale?

Q. How did you determine the accuracy of the scale?

A. I took, for instance, from that point to that point (indicating).

Q. From the line marked East Fifty-second Street?

A. It does not make any difference; say from that point to that point (indicating).

Q. From the top to the bottom of the map?

A. Yes. I then compared it with the scale to see how much it gave me according to that scale there, and then I compared that with the official record.

Q. Now, this map is done in colors?

A. Yes, sir.

Q. Do you know what the various colors represent?

A. Yes, sir.

Q. What do they represent?

A. Various sizes of mains, that is an eight, that is a six, that is a four, that is a sixteen, that is a sixteen, that is an eight and that is an eight and a six, and so on (indicating).

Q. But the buildings are all colored, also, every building, every piece of real estate is colored?

A. Yes, sir.

Q. What does that mean?

A. That is done by the man who provides the maps, to indicate different kinds of buildings. That pink there indicates a 5568 brick building, the yellow you will find indicates frame buildings, and those are frame buildings there (indicating); and that indicates a tenement house or an apartment house or a flat. Those are private residences (indicating).

Q. And as each piece of property changes, it is changed in your map, is it not?

A. Yes, sir.

Q. What is the object of keeping this so thoroughly with regard to the houses and apartments and buildings?

A. What is the object?

Q. Yes.

A. Well, because this is a map for reference.

Q. Well, in other words, you, I understand, Mr. Simpson, follow up the buildings in the City of New York for the purpose of introducing the gas, do you?

A. Yes, sir.

Q. And do you consult this map or any other book?

A. No, sir, we have men out in the district to do that, and this is done by the people who sell you the maps.

By Mr. MATHEWSON:

Q. What is done?

A. This pasting on alterations to buildings.

Q. That is, indicating the character of buildings?

A. Yes, sir. If a building—for instance, this is pasted on now (indicating). They come once a month and paste in all the changes in the buildings.

By Mr. BURR:

Q. And you, I understand, keep in touch with the Building Department, and keep in touch with all the new buildings that are going up and make your gas connection at the proper time with each building?

A. Yes, sir.

Q. That is done throughout the whole island of Manhattan, is it not?

A. Yes, sir.

5569 Q. Now, then, you have this system of coloring to show the character of the mains in each street?

A. Yes, sir.

Q. As it appears upon each one of these maps?

A. Yes, sir.

Q. Can you tell offhand what these various colors mean as to the sizes of mains?

A. Yes, sir.

Q. Did you find in Dr. Marks' compilation of his schedule, as taken from these maps, any inaccuracy as to the duplication or triplication or quadruplication of mains in the streets?

A. I did not look at it at all, never thought about it.

Q. So you have nothing to say as to the accuracy or inaccuracy of his statement in that regard?

A. No, sir, nothing at all.

Q. Now, when you abandon a main, or when you disuse a main, what do you do on this map?

A. We make an erasure. If this main here were to be abandoned, we would make a little erasure there and there (indicating), and write on it the year it was abandoned or disused.

Q. Can you point out in the series of maps you now have here in the Master's office the location of the seventy miles of abandoned mains which you have testified to?

A. Yes, I can, if you will have the patience to go through all the volumes.

Q. You could show that, could you?

A. Yes.

Mr. Mathewson: Seventy-five miles that were abandoned above the 822?

The Witness: Yes.

Mr. Burr: Which is it, 822 or 795?

Mr. Mathewson: You know as well as I do; 822 includes the mains which were called active mains and those which were disused for some purposes exclusive of the abandoned mains, which were some seventy or eighty miles more. The testimony is that 5570 the abandoned mains included would make 880 or 890 miles, my recollection is.

Q. I notice here at this point, East Fifty-second street, between Fifty-second and Fifty-seventh Street and Third Avenue, on Third Avenue, there are how many mains, four, five?

A. Five, yes, sir.

Q. These breaks in the line showing the main, has that any particular significance?

A. It indicates the system.

Q. The system?

A. Yes, sir.

Q. It indicates the company to whom the mains belong?

A. Yes, sir, before consolidation.

Q. Take Third Avenue at this point, can you tell off-hand by the coloring there, and the appearance of those lines what mains they are and what companies they belong to?

A. Yes, sir, that is a six-inch Metropolitan.

Q. The red line?

A. The red line. That was a six inch Knickerbocker.

Q. That is the yellow?

A. Yes, but made a Metropolitan; that is a sixteen-inch Municipal.

Q. One is orange and the other is yellow?

A. No, they are supposed to be the same color. That is an eight-inch Municipal and an eight-inch Metropolitan.

Q. The eight-inch Municipal is the blue line?

A. They are both blue lines.

Q. And the other one is what?

A. Metropolitan.

Q. Now, you read Dr. Marks' testimony that within the time allowed him he had these mains measured by means of a steel tape upon each map?

A. Yes, sir.

Q. And you heard him testify that so far as these corners to which you have referred are concerned, he got the dimensions of those corners through curving the steel tape?

A. No, sir, he did not say that at all. He said where there 5571 wasn't a straight line that he curved his tape, put it on edge that way; for instance, if that main went around that way in a curve, he would place his tape on edge like that (indicating).

Q. Well, it would be possible to get the dimensions of the curves by standing the steel tape on edge, wouldn't it?

A. No, sir, because that curve is not drawn to the scale.

Q. Assuming that the scale was all right?

A. Assuming these mains were put in to scale, you could get it, but that curve from start to finish might be one hundred feet or twenty feet, the length of the curve.

Q. And I understand you to say that when you make a change in the main you report to the head office and there shortly after it is entered in the books, that is the system, and from the books it is entered in the maps?

A. When a main is laid or any alteration made, it is sent to me and it is entered on the books and on the maps.

Q. Do you remember when your attention was first called to this matter of the mains you testified on page 338 of the record that those maps correctly set down the exact situations with regard to the maps.

Mr. MATHEWSON: Suppose you let him see what he did testify to.

Mr. BURR: I will read it. You were asked: Q. And it is part of your duty, is it not, to keep a record of what work is done upon every main in every such street? A. Yes, sir. Q. And for that purpose you must have a very accurate record of the work that is done on such mains? A. It is not kept in detail in the way you mean. I get the pay roll every week and it is entered up in the pay roll what is expended for new mains, repairs, overhauling 5572 and so on, sub-divided under those headings. Q. I understood you to say you had a map showing accurately the whole system of mains in the City of New York? A. We have maps showing the entire system of mains on the Island of Manhattan belonging to the Consolidated Gas Company, one system of maps. Q. And have you another system showing the mains of the other companies? A. We have copies of maps of their-, or of maps we made ourselves before the other companies were consolidated. Q. So taken together for your proper information you have a complete record through these maps of every main in the streets of the City of New York? A. Yes, sir; every gas main. Q. Every gas main, that is the only main I am speaking of? A. Yes, sir."

Mr. MATHEWSON: All of which is so, but he does not say they are drawn to scale.

The WITNESS: This is an accurate map we have of our system of mains. It does not say it is drawn to scale.

You were asked:

"Q. Where is that series of maps? A. In my office."

A. Yes, sir.

"Q. Mr. MATHEWSON: Those were the ones that weighed a quarter of a ton, that Senator Page asked me about. Q. Does that map show the date of the putting down of each main? A. No, sir; no dates at all. Q. In order to understand that map one would have to possess the book which you have with this accurate record you spoke of? A. No, not to understand it. If you wanted to get the 5573 distance from the curb and the depth you would have to have the book."

A. Exactly.

Q. So that with that exception these maps are accurate?

A. Yes, sir.

Q. How is it that you testified yesterday that in every instance you examined these maps the scale is defective?

A. I am not saying for one minute that they are drawn to scale. I continued to tell you that they are not drawn to scale.

Q. Do you wish the court to understand that all these maps are inaccurate in the scale of feet as shown?

A. These maps are absolutely correct as showing on any one street what gas mains there are belonging to the Consolidated Gas Company. I never pretended that they showed the distance from the curb or the length of main there was there, but if this map shows, as it does here, that there are two six-inch mains on Fifty-fifth Street between Second and Third Avenues, that is absolutely correct; there is not a main on these volumes that should not be there.

Q. I notice on this map on page 107 there is a scale of feet given.

A. Yes, sir.

Q. And also a metric scale?

A. Yes, sir.

Q. Decameters and hectameters?

A. Yes, sir.

Q. Do you wish to be understood as saying that both these scales are inaccurate?

A. I have not bothered with that at all, I am using the one used by Dr. Marks.

Q. The one you have used is inaccurate?

A. Yes.

Q. And every scale of feet you examined in your examination of 20 per cent. of Dr. Marks' work you found to be inaccurate and against the company?

A. Yes.

Q. Short?

A. Yes.

5574 Q. And do you now say that every scale of feet on these maps is inaccurate and short?

A. No, sir.

Mr. Mathewson: He says he has examined 20 per cent. How can he say as to the others? The presumption is that they are.

Q. Did you ever examine the scale of feet of these maps prior to the examination you have made because of the schedule of mains given by Dr. Marks?

A. No, sir; I never had occasion to. I never used these maps for getting distances or anything of that kind. Never dreamed of doing it.

Q. These are kept at the main office of the company?

A. These are kept at the main office of the company for nothing but ready reference, showing the size of mains on a street and the side of the street they are on. That is purely all they are for.

Q. I thought you said, in your direct testimony, when you were first questioned about these, or Mr. Mathewson did in your presence, that it would take six months to make a copy of these maps?

A. A copy? I don't remember of speaking of making a copy of the maps.

Q. Don't you remember we asked for these maps when you were first on the stand?

A. Yes.

Q. And they were referred to as weighing ten tons, and that it would take six months to examine them?

Mr. **Mathewson**: Half a ton, do not make it ten.

Q. Do you remember being asked about the seventy miles of abandoned mains, Mr. Simpson, when you were first examined on this inquiry, and that you testified then that there was no way that you could tell where the seventy miles of abandoned mains were
5575 located?

A. No, sir, I said it could be picked out, but it would take a long time.

Mr. **Burr**: I will continue my examination after recess.

At 1 p. m. adjourned for recess until 2.15 p. m.

After Recess.

Q. What do you say was the total difference in feet between your measurements and Dr. Marks' schedule?

A. You mean to start with, before we found any errors.

Q. Yes.

Mr. **Mathewson**: Mr. Simpson's was not by measurements. He gave no measurements.

A. I just take Mr. Marks' testimony, that is all. Professor Marks, in his testimony allowed us 3,862,282.90 feet of active mains, and 230,630.40 feet of disused mains, making a total of 4,092,913.30 feet against our total of 4,344,849.00 feet.

Q. That would make a difference of how many thousand feet. Something like 251,936 feet?

A. 251,935.70 feet. And from that should be deducted though, the 29,111 feet that Mr. Marks' allows for the Bronx.

By Mr. **Mathewson**:

Q. That 29,111 was not in his total?

A. No, he allowed it for the Bronx, but did not put it in his total. Leaving 222,824.70 feet.

5576 By Mr. **Burr**:

Q. Now, is that your understanding of the only difference between Dr. Marks' figures and yours with regard to these mains?

—. ——.

A. That is the only difference between your claim and his figures, as to mileage?

A. Yes, sir.

Q. How many miles would that represent?

—. Do you want it roughly or exactly?

Q. Roughly.

A. About between forty-three and forty-four miles.

Q. Now, you have stated that you have found from an examination of the maps that there were five maps omitted?

A. Five maps omitted.

Q. What maps were they?

A. Pages 118, 119, 120, 121 and 122 of Volume 6.

Q. How many miles do they represent?

A. 24.25.

Q. And the total was forty-four miles?

A. Forty-four, yes, sir.

Q. That makes a difference of twenty miles?

A. Yes, sir.

Mr. BURR: Now, in all fairness, it is proper I should say that we have found that Mr. Simpson is correct in that regard; that we did omit the five maps. The young men who had the compilation had them on their original notes, but in some manner or in some way due to the magnitude of the thing they omitted those five maps, and it is only proper to say that; but you will appreciate the great undertaking Dr. Marks tried to accomplish in taking the measurements of this vast number of maps.

Q. Now, the accountants' report, Mr. Simpson, is that December 31st, 1905, from the books of the company, there appeared to be 804,594 miles of mains (page 1449 of exhibits). I show you 5577 the statement as presented in that regard. I am speaking of the report of Marwick, Mitchell & Company, the accountants?

A. Yes, sir.

Q. As it appears in City's Exhibit 87; is that correct?

A. I would not say offhand it is correct.

Mr. MATHEWSON: Of course, Mr. Burr, the main mileage as we had it out yesterday differs from you in that if we abandon a main that comes out and then the new main goes in, and that represents those since the 31st of October, which was the date of our main mileage of 822; and December 31st, some mains had evidently been abandoned or cut off and other mains had been put in. Undoubtedly, that represents the difference.

Mr. BURR: What I would like to have clear is: is there any doubt that the mileage, as given by the accountants and taken from the books of the company as such mileage appears on that date, is correct?

Mr. MATHEWSON: I don't know. I don't think Simpson could tell offhand.

The WITNESS: I could not tell offhand. I will look it up.

Mr. MATHEWSON: I will have Mr. Simpson or somebody else look it up and he can answer the questions?

Q. Now, Dr. Marks gave the total active mains in Manhattan as 731.49 miles by his measurements, and to that must be added, as I have already stated, the five maps omitted, 24.25, which would make a total of 755.74.

A. What about the Bronx.

Mr. **Mathewson**: That is the Bronx.

The **Witness**: No; he said Manhattan only.

5578 Q. The Bronx is omitted from this?

A. No, sir. It is not included in Mr. Marks' total at all.

Q. Well, we will assume for the present that the Bronx was omitted from it.

A. (No answer.)

By Mr. **Mathewson**:

Q. That would make how much—five and one-half miles more?

A. About five and one-half.

By Mr. **Burr**:

Q. Then the total disused mains was 43.68; abandoned .05, which would make the total 799.48?

A. Yes, sir.

Mr. **Mathewson**: That is Dr. Marks' total?

Mr. **Burr**: Yes.

Q. And if you include the Bronx it makes 804?

A. Yes.

Mr. **Mathewson**: Always state whether it does according to yours, or does according to Mr. Marks' figures.

The **Witness**: According to Mr. Marks' figures the Bronx was not included, the 29,111 feet.

Q. And the 804 miles would be his total putting in the Bronx, and putting these five maps omitted in?

A. Yes.

By Mr. **Burr**:

Q. I call your attention to City's Exhibit 91, as it appears on page 1538. You will see that Dr. Marks has given there for Manhattan 731.49; for the Bronx, 5.51; total, 737. So you will see he did not include in that 731.49 the Bronx.

A. I said he did not include them. He left it out.

Q. Your figures were 795?

A. Yes.

5579 By Mr. **Mathewson**:

Q. And 24.25 would make 761.25 for his measurement of active mains?

A. There was a whole lot more things here that he did not get out. Here is a clear omission, you know. An omission in the schedules, eight miles alone.

By Mr. **Burr**:

Q. Marwick & Mitchell give 804.59 as the number of miles in their exhibit, to which I have called your attention. Dr. Marks gives 731.49 miles in the Borough of Manhattan. He allows for the five maps omitted 24.25; total, 755.74; total disused mains, 43.68; abandoned, .05, making a total of 799.48, to which if you add the Bronx 5.51 gives 804.99, or exactly what Marwick & Mitchell gave.

Mr. **Mathewson**: That is the barest kind of a coincidence. In these schedules Mr. Simpson has presented here there are miles more omitted besides that which he points out; besides those maps, whole blocks here and there.

The **Witness**: The one item of the scale alone would——

Q. Now, if before measuring the mains on the maps the correctness of the scale was tested and the measurement of the mains was made by a correct scale, that would make some difference in your claim as to the difference, wouldn't it? If the scale was corrected before the measurements were made?

A. I am absolutely convinced that if those maps were drawn to a scale and an attempt was made to measure the length from those maps I do not believe there is a human being in the world to-day could get the thing correct in less than six months' hard work.

5580 Q. Of course, we did the best we could under the circumstances; you understand that, Mr. Simpson?

A. I suppose so.

Q. And you are now reiterating what I think you called attention to in the early part of your testimony, that it would take six months to measure these records and maps of mains?

A. I know *I* could do it in six months.

Q. And did you take these examinations yourself of these corrections?

A. Some of them I made myself, on some of them I had the examinations made and attention called to them, and then checked them up after they were shown me. I may say I have all the volumes in court with reference to that matter there, and you may check up anything you may want to check up now.

Q. Have you any explanations to give as to why the maps do not agree, as you claim, with the scale given?

A. Yes, sir; because the man that made the maps explained to me that it was due at first to the shrinking of the paper, and then the ruling of the paper, pasting it on the linen back and ruling it.

Q. Making allowance for the shrinking of the paper it would be possible then to correct the scale?

A. No, because your paper shrinks one way, and your scale shrinks the other. You take a line running up and down the page, and your scale runs across the page, so that both shrink differently.

Q. Who took the photographs of the trenches, or openings?

A. The first one was taken by Mr. Fogg and the others were taken by Mr. Bennett.

Q. Who is Mr. Fogg?

A. Mr. Fogg is one of my engineers.

Q. Who is Mr. Bennett?

A. He is a gentleman connected with the Consolidated Gas Company.

Q. Have you a photographic department there?

A. No. We have a cemera, a large apparatus, and we have three or four official photographers.

5581 Q. Did you give any instructions to the photographers as to what you wanted him to do?

A. I did sir; I told him to take photographs of certain localities showing exactly the conditions existing there.

Q. And you pointed out the spot you wanted photographed?

A. I did not point out the spot I wanted photographed. I pointed out the blocks.

Q. Well, for instances, where you photographed yourself you had pointed out that spot?

A. I stood on the spot myself, yes, sir.

Mr. BURR: I merely desire to impress upon the mind of the Master and to disabuse any impression that might have been received from the statement yesterday that in all cases these things were against the company—Dr. Marks' figures, shortages, etc., that these maps were omitted. We find that the five maps omitted is the fact, and as I say you will appreciate the——

The MASTER: Oh, I think I understand it.

Mr. BURR (Continuing): The magnitude of the job Dr. Marks attempts to do in connection with the examination of the books and the appraisal of the machinery and property of the plants.

Mr. MATHEWSON: And counsel and the Master will also appreciate the force of my suggestion at the time that the work was utterly idle and useless and without value and would be.

Mr. BURR: That is all I want to ask, Mr. Simpson.

Redirect examination by Mr. MATHEWSON:

Q. Mr. Kirby called attention to the fact that the company employed one main where the pressure was as high as a pound and you stated that that continued only for a short distance. As a matter of fact is that not a trunk main from which no services are drawn? 5582

A. It is.

Q. Running down town?

A. It is a main leaving Twenty-first Street Works and runs downtown to Beaver Street—has only one connection off it between Twenty-first Street and Beaver Street.

Q. And that not a service?

A. No, sir. That is a twenty-inch.

Q. And the pressure falls to about $2\frac{1}{2}$ inches to the end. *Q*. So that the high pressure continues only for a very short distance?

A. The high pressure continues, what you might call high pressure does not continue for more than half a mile from the works.

Q. When you testified that one block and two wedges were used to every six feet of pipe you said that so far as the main laid under your supervision was concerned that you knew that from the laying, as to the balance of the pipe which was laid before you took charge, that was the result of your observation, was it?

A. Yes, sir.

Q. At what time did the East River Gas Company begin to use the heavier mains the same as are used by the Consolidated, and by whose advice and how many years ago?

A. Began about five or six years ago.

Q. And upon whose advice was the heavier main employed after that?

A. Mine.

Q. Now, in reference to the weights of the main, you testified, I think, that about one-half the present mileage or more than half had been laid new since 1884, either as new construction or in replacement of smaller pipe?

A. Yes, sir.

Q. As to the old mains which have not been replaced, isn't it the fact that hundreds of thousands of feet of the old mains have been taken up?

A. Hundreds of thousands of feet, yes.

5583 Q. Have you had occasion to use those mains which were taken up from time to time in repair work?

A. Some of the sizes, yes, sir.

Q. And in that case were they weighed by the company before being sent out?

A. Yes, sir.

Q. And did you find——

A. That is the mains, the pipe is weighed——

Q. And did you find that that old pipe, so weighed ran below the weight which the company is using now?

A. No, sir.

Q. So that all your tests, and all your observations, teach you that the old pipe was as heavy as the present?

A. Yes, sir.

Q. Now, Mr. Marks, and possibly one other witness, testified as to a hypothetical system of mains involving one main in a street. If that were to be installed, would it, in your judgment, cost more or less than the present system of mains as carried on the books of the company, $7,852,000?

A. It would cost a great deal more.

Q. And what would be the effect as to services, the length of services, and so forth?

A. It would necessitate running a great many long services, 50 per cent. of them would be long.

Q. If you have to lay your mains on the side of the street, wouldn't that mean you would have to run some of your services in together, and over, around, or beyond the sub-surface structures, from the one side of the street to the other?

A. It certainly would.

Q. What has been the effect of that in reference to the length of service—to increase or reduce the size?

A. To reduce them.

Q. Would you consider such a system advisable, quite aside from the matter of expense and installation, a single main system throughout the city?

A. I would not, sir. I would say furthermore as far
5584 as the avenues were concerned it would be impossible, and in
a great many of the streets it would be impossible.

Q. (Handing papers.) While we are on this subject of pressure, have you received complaints from the Chief Engineer of Light and Power of the City of New York, Mr. C. F. Lacombe, who has testified here, in reference to the pressure which you have maintained within the last few months?

A. Yes, sir.

Q. Are these the letters to which you refer?

A. Yes, sir.

Q. Will you read the first one on the record, the first date?

A.—

"BUREAU OF LAMPS AND GAS.
NEW YORK, *November* 5, 1906.

Consolidated Gas Company, 4 Irving Place, City.

GENTLEMEN: The following is a copy of letter received from the Gas Consumers' Association which is self-explanatory:

"Mr. C. F. Lacombe.

DEAR SIR: We find that the trouble with the lights at the Pumping Station, 179th Street and Amsterdam Avenue, is due to the insufficiency of pressure of gas in the service and the regulators are in no way to blame for the trouble. We met the inspector of the Consolidated Gas Company here by appointment and demonstrated this fact to him conclusively.

Yours very truly,
(Signed) W. S. FURMAN, *Mgr.*"

Kindly give the above matter your early attention, and report on same.

Very truly yours,
(Signed) C. F. LACOMBE,
Chief Engineer of Light and Power."

5585 Q. That means the city pumping station?

A. Yes, sir.

Q. What was the second letter?

A.—

"DEPARTMENT OF WATER SUPPLY, GAS AND ELECTRICITY.
CITY OF NEW YORK,
13-21 PARK ROW, *Dec.* 12, 1906.

Consolidated Gas Company, 4 Irving Place, City.

GENTLEMEN: On November 5th we wrote you in reference to poor pressure at the Pumping Station, 179th Street and Amsterdam Avenue, and requested you to correct same.

As we did not hear from you in reference to this complaint, we had one of our inspectors make an inspection on December 5th and he found that the trouble had not been remedied.

Will you kindly give this matter your immediate attention, and *notify us when corrected?* I am,

Very truly yours,
(Signed) C. F. LACOMBE,
Chief Engineer of Light and Power."

Q. Did you thereupon make investigations as to the pressure being maintained there?

A. I had investigation made.

Q. And did you have the pressure gauged?

A. I went up and looked over the ground myself, and had a record pressure gauge set.

Q. What was the pressure you found, thirteen tenths or one and three-tenths?

A. I found the pressure at the nearest street lamp was one and three-tenths inches.

5586 Q. Now, in reference to sheathing, Mr. Simpson; is it not true that sheathing is required to support the other structure in the street and the traffic passing as well as to maintain the material which you may put in?

A. Yes.

Q. Is it possible to get a trench absolutely level and at the same time solid enough to support your main at the outset without blocking or wedging?

The Master: Did he not testify pretty fully about that, Mr. Mathewson?

Mr. Mathewson: I don't know that he did exactly as to that.

The Master: I think Mr. Kirby put him through that pretty fully.

Mr. Mathewson: I was going to ask him if that would not require the excavation mathematically for the point required on the bell in each case, if he was to lay it flat on the earth, or else the pipe would rest on the bells at the ends and the rest of the pipe would not touch the earth.

Q. Is not that so?

A. Yes, sir.

Q. When you spoke about not leaving the foreman discretion in reference to blocking or wedging, will you explain a little further what you had in mind as to the cases which do not require, in your judgment, blocking and wedging? Are they many or few, and what have you in mind?

A. Well, I meant that in practically every instance that blocking and wedging was necessary; that it is possible that you might here and there in New York find a block or part of a block where the soil was so good and the conditions were so good that you might possibly get along without blocking, but it would not be advisable to leave it out, in my opinion.

Q. Would those instances be so few as to cut an insignificant figure in the total, or would they be large?

A. It would not make a difference in the total of $250—not $50 even.

5587 Q. In the whole system?

A. No.

Q. If you took the whole system of mains together, would it make a difference of more than $1,000?

A. No; it would not take off $50 from the $50,000 I allowed for blocking and wedging.

Q. In reference to the operation of this tamping bar and rammer, did I understand you to say that the rammer was only to be used on the top of the main, or is it to put down beside the main?

A. Not only on top, but beside the main.

Q. How much room is required to operate that in width of ditch?

A. You have got to have room enough for a man to stand and enough room to pass the head of the rammer down between the pipe and side of the trench.

Q. And as to the tamping iron?

A. The tamping iron would require about twice as much room to handle, or more than twice as much as the hammer, because it has to be held at an angle and used at an angle.

Q. How much in width would you say for an ordinary depth of trench, say three feet or four feet?

A. I should not think you could use a tamping bar to advantage in a ditch four feet deep without having at least eighteen-inch play room between the side of the pipe and the side of the trench on any pipe of any size.

Q. Take those few instances in which in your judgment it might be possible to lay the main without blocking and wedging, is not there danger there from subsequent construction which are coming in those streets and in leaving the main resting on earth without blocking?

A. No, sir. The blocking would not make any difference in that case at all.

5588 Q. You stated you could not caulk gas mains too carefully for gas; as a matter of fact, compared with water mains, will not gas escape where water will not?

A. It will——

Q. And have you complaints as to gas odors and otherwise which escape from mains from time to time?

A. A great many of them.

Q. Have you noted within recent years complaints of the city officials as to the leakage of water being very great in New York City?

A. I have read a great deal of it.

Q. On the other hand, how does the leakage of the Consolidated Gas Company or unaccounted-for gas compare with other companies that you know of?

A. I think if not the smallest it is one of the smallest of any large city in the world.

Q. Do you remember that the unaccounted-for gas by the Exhibits was about 14 per cent. in 1884, and it has now been reduced to about 2 per cent.?

A. Yes, sir; about 2 per cent.

Q. And if by reason of insufficient caulking, gas was allowed to escape and the unaccounted-for gas increased, that would raise the cost of gas per thousand feet sold, would it not?

A. It would.

Mr. Burr: That is all speculation. I do not think it is proper rebuttal, Mr. Master.

Mr. Mathewson: I am asking questions on the line which you and Mr. Kirby did fully. You referred to water and gas mains, and I have shown the situation. Ours are good, and apparently the water mains are bad, according to the reports of your own officials.

Mr. Kirby: You have not given the reason why.

Mr. Mathewson: I do not have to.

Q. In reference to the pipe used in Boston for water mains, Mr. Kirby read you some weights which were lighter than those used here?

A. Yes.

5589 Q. And you said that there were at least four weights used there?

A. Yes.

Q. How about the heavier weights, how do they compare with the weights of the Consolidated Gas Company?

A. They are far heavier than those we use.

Q. Is there any general rule which can be promulgated as to the weight of pipe required in the distribution system of a gas company without taking into account the local conditions as to traffic and other structures fully and all the details?

A. No, sir; none whatever.

Q. Do your pipes sometimes break even now with the weight which they have?

A. Very often.

Q. What would be the effect of lighter pipe in that regard?

A. We would have more broken than we have now.

Q. And the replacing of pipe in a situation of that sort would be a matter of large expense, would it not under the present pavements?

A. It would be very large.

Q. In reference to the rock at Sixty-third Street which you said was the only instance you recall where it was disposed of, that was taken out in excavation for a holder, was it not?

A. Yes, sir.

Q. In large blocks?

A. Large blocks. I may add that the man who bought the rock picked out such such pieces as suited him as to size and grain and so on.

Q. You also stated that when the subway was built and the trolley conduits were constructed, that the Consolidated Gas Company was paid the expense of moving mains or some expense for rearranging?

A. Yes, sir.

Q. Was not the company put to a good deal of expense in addition to anything that was paid by these subway or trolley companies?

A. It was, yes, sir.

5590 Q. In what lines?

A. We were only paid for any actual work performed. We were not paid one cent for the patrolling and watching of the work to see that they did not injure our system.

Q. And the inspection?

A. And the inspection.

Q. And the rearrangement of mains in your own records, to show the changed conditions, did they pay for that?

A. No, sir, did not pay for that at all.

Q. Your attention was called to the fact that one of the photographs which you have presented showed salt water mains in the middle of the street. Have you photographs that show that here?

A. Yes, sir.

Q. (Handing photograph.) Will you look at these two photographs and say whether they show that condition?

A. On Thirteenth Street, west of Third Avenue, the main is almost exactly in the centre of the street; in fact, it is exactly in the centre.

Mr. Mathewson: I offer that photograph in evidence.

Photograph received and marked Complainant's Exhibit 295.

The Witness: And this other one, Seventeenth Street, between Fifth and Sixth Avenues, the cut is also exactly in the middle of the street.

Mr. Mathewson: I offer that in evidence.

Photograph received in evidence and marked Complainant's Exhibit 296.

Q. It has been testified to by you that the edges of the pavement broke down where a ditch is temporarily covered and some time elapses between the closing of the ditch and the final repavement by the asphalt company of the city. As a matter of fact, in your computations, how much did you allow beyond the width of the trench on each side for repaving?

A. Three inches.

5591 Q. Is three inches the width which is actually repaved, or the minimum or maximum?

A. It is the minimum.

Q. Then the average in fact would be greater than that?

A. In nearly all cases it will run between four and six inches, some times as much as a foot on each side.

Q. Then your estimate is lower instead of above the average of your experience?

A. Yes, sir. One of these photographs shows five inches on one side and six on the other for the salt water main.

Q. Which is that?

A. That one there (indicating).

Q. That is Complainant's Exhibit 280?

A. Yes, sir. One side is five inch trim and the other side is six inch.

Q. Is it possible, Mr. Simpson, in your judgment for anyone to make an accurate or even approximately accurate estimate of the cost of installation of mains in the City of New York without a long and thorough study and exact knowledge of conditions still existing?

A. It is not any more than it would be possible for me to go to Boston or Chicago, or any place like that, and make an estimate there. I could not do that, and I would refuse to do it, unless I had gone into the thing very thoroughly.

Q. In spite of your wide experience generally?

A. In spite of my twenty-five years' experience in New York City.

Q. Mr. Burr has asked you with reference to the schedules, city's exhibits 92 and 103. In comparing them with the maps in reference to the mains you did compare, why didn't you endeavor to examine all of those 350 or 360 pages and compare them?

A. To start with, I knew that it was an absolute impossibility to get any correct data in the way Mr. Marks went at it; in the second place, the errors I found were so many and so glaring, and 5592 they were of so many varieties, that there was not time to take all the errors that were there. I took a few of each kind just as an example.

Q. In order to test the accuracy of the general work?

A. No, in order to prove that I was right and that they could not make those measurements. I knew it was not accurate before I started.

Q. In reference to these twenty-four or twenty-five miles which were omitted in one lump, were they active or disused mains?

A. Active.

Q. You have been asked in reference to services of the gas company where electricity is introduced to a building, and have stated that they were, as a rule, left. Why are they left?

A. Because they are in practically every case needed.

Q. Is the gas still connected with the house?

A. If not needed for illuminating purposes, in addition to the electricity, they will need it for fuel purposes, or heating purposes, gas ranges and so on.

Q. Now, you have the maps here which Professor Marks examined, have you not?

A. Yes.

Q. And are prepared to test the accuracy of any schedules which you presented?

A. Yes, sir.

Q. I will ask you to test one of them before the Master. Is that your sheet?

A. What one shall I take? Pick out one?

Q. Well, take this 5th Avenue one—no, take one later than that; take the one on Lenox Avenue, 115th to 110th Streets, which I have checked on this sheet.

A. Get me volume 8, Lenox Avenue, between 115th and what street?

Q. It is described there.

A. Lenox Avenue from the north property line of 115th Street to the south property line of 110th Street. Now, that reaches from the north property line of 115th Street to the south property line of 110th Street. The south property line of 110th Street is 5593 here (indicating). The north property line of 115th Street is there (indicating), that is 24 14/16 inches.

Q. Twenty-four and seven-eighths?

A. Well, Mr. Marks gave it in sixteenths. The official measurement for that——

Mr. **Marks**: What do you mean by the official measurement?

The **Witness**: On this card (indicating) the distance of streets and avenues and blocks and so on. From Ninety-sixth to 125th Street the blocks are 201 feet 10 inches long. There are five blocks, 1,009 feet 2 inches; there are five sixty-foot streets.

Q. Are there not six?

A. No; there is a 100-foot street coming. Five sixty-foot streets, that is 300 feet; there is one 100-foot street, 110th Street, so that the distance there officially is 1,409 feet 2 inches. 24 14/16 of the scale, I will take twice ten inches first for convenience sake; ten inches is 550 feet; twice 550 feet is 1,100 feet. Now, I have got 4 14/16 inches, that is 270 feet exactly; is it not, Professor?

Mr. **Marks**: 267 or 268.

The **Witness**: Well, 267; I said 270, which makes 1,367 feet against the official scale of 1,409; that is the difference. Now, I want to call your attention, Mr. Mathewson—of course, that refers to the mains on that avenue, too, and on that avenue and that avenue (indicating).

Q. That is on Lenox, 7th and 5th?

A. Yes; it takes every avenue which is on that page, and I have only quoted one or given the exact figures.

Mr. **Burr**: Why is 5th Avenue given on that map?

The **Witness**: Does it make any difference if it is a
5594 straight line, whether I measure from this side of the page
or from that side? Would it not come to the same thing?
These lines are perfectly straight across here, and straight across
there (indicating).

Q. Of course there might be a slight difference in measuring in this manner due to the personal equation, but not enough to affect the general proposition that the measurements are incorrect, is that right?

A. No. If you want to get it within the finest kind of point, you have to have a very bright light, and one man holding one end and another man the other.

Q. And that you have not here?

A. No; the light is not bright enough; it is very hard to read these sixteenths of an inch.

By Mr. **Burr**:

Q. While you have the map there, I understood you to say these maps were made by—what was his name?

A. Who drew the map?

Q. Yes.

A. Do you mean who drew the mains in?

Q. Yes; I asked you to give me the name of the man who drew the maps.

A. I gave you the name of the man who put the mains in.

Q. These are insurance maps?

A. Yes.

Q. These purport to be insurance maps of the City of New York surveyed by Perris & Brown, 55 Liberty Street, 1889; that is right, is it not?

A. Yes, sir.

Q. And when you spoke of the gentleman under you having made these maps and having been engaged in making them, you simply referred to his placing on these maps the mains?

A. Yes, sir.

Q. And when you say that the paper shrank, therefore affecting the scale, if the paper is shrunk, it would affect the whole map, would it not?

A. What I meant was if the paper shrank this way——

5595 Mr. MATHEWSON: Say it shrunk lengthwise.

The WITNESS: If the paper shrunk lengthwise and the scale is running across the book, it would make a difference.

Q. Do you know in which way the paper has shrunk in any instance?

A. I have not any idea. It shrinks in the printing and in the backing.

By Mr. MATHEWSON:

Q. In some cases, Mr. Simpson, where these pasters are put on these maps by the makers of the maps, where the character of buildings changes, do not the pasters extend out over the mains?

A. Very often.

Q. So as to cut them off?

A. Yes, sir, very often.

Q. Have you, then, to redraw the mains?

A. Yes, sir.

Q. And on these very maps, are not there instances of that character where a main appears to be cut off by a paster, whereas a main actually exists there?

A. By looking over the volume you could find several instances, and I suppose, of course, as we come across them——

Mr. BURR: I think that should be stricken out. He said you could find by looking over the volume——

The WITNESS: Well, there are several instances.

Mr. BURR: Then say so.

The WITNESS: Well, there are several instances which you can find by looking through the volumes. Of course, it is our practice whenever we come across those to put the mains on again.

Mr. MATHEWSON: If you want to see one, I am told there is one on page 107 of Volume 6.

5596 Q. Now, Mr. Burr has drawn your attention to the fact that, taking Mr. Marks' figures as computed out, and adding to them the Bronx mains and the amount of the five maps omitted and the disused mains, Mr. Marks reaches a total of 804.99 miles, which is substantially the amount given as of a different date by the accountants Marwick, Mitchell & Company or Mr. Hall. Does the 804.99 take into account other errors which you have discovered, even so far as you have examined and which appear in your comparisons of totals to which you have referred?

A. No, sir, it does not.

Q. So if there is any such correspondence as that it is a coincidence, isn't it?

A. Merely a coincidence.

Q. Is there any doubt from the figures, from your own information and records, that the amount of active mains of the company on October 31, 1905, actually amounted to the figure you have given, 795 and a fraction?

A. Not the slightest doubt.

Q. And if there appears more disused mains than the twenty-seven miles and a fraction which you gave, that would indicate merely, would it not, that some mains which were marked disused on the maps have since been abandoned, and have not yet been marked off?

A. Yes, sir.

Mr. Mathewson: That is all.

By Mr. Burr:

Q. I will ask a question which I should have asked before. I understood you to say, when Mr. Mathewson asked you as to what experience you had, and if you would rehearse that story again, that you took occasion to say that the mains from Astoria were now in successful operation—did I understand you correctly?

A. Yes.

5597 Q. Will you tell me how they are being successfully operated to-day?

A. By conveying gas from Astoria to Ravenswood and through the tunnel to New York.

Q. Well, they are conveying gas from the first unit at Astoria?

A. Yes, sir.

Q. To where?

A. To Ravenswood in Long Island City.

Q. Through whose mains?

A. Through the sixty-inch main that I was talking about.

Q. Well, to whom does that belong, whose main is it?

A. Well, I suppose it belongs to the East River Gas Company of Long Island City.

Q. And where does that connect, at Ravenswood?

A. Yes, sir.

Q. With what main does it connect there?

A. It connects there with the works and the tunnel.

Q. And is that the East River Gas Company's main, too, in the tunnel?

A. Yes, sir.

Q. So that the Astoria plant is making gas and transferring it to the Borough of Manhattan through the sixty-inch main owned by the East River Gas Company at Ravenswood and extended through the tunnel under the East River?

A. I don't know that it is owned by the East River Gas Company;

it was laid by the East River Gas Company; that is one of the things I don't know.

Q. Where does it connect with the Consolidated in Manhattan?

Mr. MATHEWSON: That all appears in evidence, where the tunnel from Ravenswood connects with the Consolidated Gas Company.

Mr. BURR: This is something which has recently happened.

The MASTER: Do not discuss it at length, he may answer.

Q. Where does it connect?

A. At a great many points.

5598 Q. The main in the tunnel?

A. The main going through the tunnel connects with several mains of the Consolidated Gas Company in Manhattan.

Q. What are they?

Mr. MATHEWSON: Is it worth while going all over this? It was all asked on the direct. It is merely additional gas going through the tunnel which has recently been manufactured.

The WITNESS: It connects with a thirty inch main which connects with every gas plant or station of the Consolidated in Manhattan. It also connects——

Q. At what point does it connect with that main?

A. Seventy-first Street and Avenue A.

Q. With what other?

A. A twenty-four inch main going to the New Amsterdam Company.

Q. Where?

A. Fortieth Street and 1st Avenue. It also connects with a thirty-six inch main going across town belonging to the East River Gas Company.

Q. You are now receiving gas to-day in that way, are you, through those mains?

A. Yes, sir. I don't know that we are receiving any gas from Astoria through those mains; I don't know what is being done with it.

Q. Where do you think it comes from?

A. It might come from the Ravenswood plant; they have a big works there at Ravenswood, making twenty-five million a day.

Q. Then you don't know that the gas is coming from the Astoria plant?

A. I know that gas is going from the Astoria plant through that main.

Q. And you suspect it comes over by way of Ravenswood?

A. Yes, sir.

Q. Now, you say that the company seeks or is ambitious to reduce the size of its services?

A. No; it seeks to reduce the length of the services, but not the size.

5599 Q. I do not mean the number, but the extent, so far as length is concerned?

A. The length of it, it does.

Q. In other words, Mr. Mathewson called attention to the fact, as he claimed, that if there was a single main in the street you would have to have longer services?

A. Yes, sir.

Q. And the idea of the company was that you should have shorter services; therefore you got as close to the curb as you possibly could?

A. Yes, sir.

Q. Have you not claimed that the reason that the company does that is because after the services are put in the services no longer belong to the company but belong to the owner of the real estate?

A. I never said so in my life.

Q. Did you not so testify in a tax proceeding?

A. No, sir; never.

Q. In an attempt to evade taxation, that the company should not be taxed for these services because after having been put in the building they belong to the owner and not to the company?

A. No, sir; never testified to anything of the kind.

Q. Did you ever hear of any one testifying to that effect for the company?

A. No, sir.

Q. You have said very frankly that you saw Dr. Marks undertake to make the measurements on these mains and you knew from the very beginning that he could not get any correct data, because of the manner in which he started to get the information that he thought the maps contained?

A. I knew he could not from the time he had.

Q. Oh, not from the method he pursued?

A. Yes, from the method he pursued, too; from the time and method.

Q. Did you call his attention to the incorrectness of the method he was pursuing?

A. I told Professor Marks that the maps were not drawn to scale in my office, and it was after a conversation of that kind I called his attention to several of that kind, and he said that he thought he could come within 5 per cent. of being correct.

Q. Didn't he tell you he was going to correct the scale?

A. He might have, but it would not make any difference.

Q. But you would not swear he did not tell you he was going to correct the scale as he went along?

A. I would not swear that he did not, and would not swear that he did.

Mr. Mathewson: He himself testified that he did not compare this scale with anything else, or correct it officially, or compare it with official scales—there is not much use of following this out. Look up his testimony. I asked him particularly about that, and he said no, he did not test this by official maps, the length or the scales.

Q. Is it not a fact that you used pebbles—or, I mean, cobble stones—instead of blocks to support your pipes?

A. I would like to catch any one of my men trying it; he would lose his job.

Q. What is the real object of putting the blocks in, so that they can support the pipe, or is it to give a space there in which the caulking may be done?

A. No, it is to support the pipe and give the pipe a good firm bed to rest on.

Mr. **Burr**: That is all.

By Mr. **Kirby**:

Q. Does the Consolidated Gas Company have any other main in which it carries a pressure approximately that of the main which we have been speaking about to-day?

A. No, sir; nor anywhere near approximating it.

5601 Q. What is the highest pressure you have in mind beside this one?

A. I should say the highest pressure we have on any other main—do you mean transfer or service main?

Q. Transfer main.

A. In a transfer main you might at some place near the station get to possibly nine or ten inches with an exhauster pushing it.

Q. You did not understand from Mr. Edgerton's testimony, did you, that he contemplated taking his services direct from this high pressure main?

A. No, I did not.

Q. In putting down these mains, that is, in digging your trench, how do you make room for your bell?

A. I allow room for the bell when I make my trench; I have room for the bell. If the trench is narrow at the bell I will widen it out.

Q. And what do you do at the bottom of the trench?

A. Open up for it.

Q. So that in no way does the pipe rest upon the bell itself?

A. No.

Q. And such blocks as you use are not laid in to support the pipe to a height that will take the weight off from the bell?

A. No.

Q. Your blocks are countersunk, are they not?

A. Yes, sir.

Q. And the bottom of the trench scooped out for that purpose?

A. Yes, sir.

Q. And your blocks rest upon the very ground which the pipe rests upon, do they not?

A. Yes, sir.

Q. And you seek in every case to get as much of the pipe as possible upon the ground, do you not?

A. We do.

Q. You have said that you considered it inadvisable to use lighter pipe. Have you ever used any lighter pipe?

A. No, sir.

Q. You said the same would break before the other would break?

A. Yes.

5602 Q. Upon what do you base that conclusion if you have not used it?

—. Upon my knowledge of the conditions.

Q. I presume that you mean in regard to leaving services in the ground when the use of gas is either discontinued in whole or in part, that no change whatever is made, that the service r-mains there as it was formerly?

A. No, sir; all our services are renewed, all services that have gas in them are renewed when they show any signs of deterioration.

Q. But they are not if they are not changed?

A. No; except if it is necessary to change them on account of size or anything of that kind.

Q. You do not take out a large one and put a small one in its place?

A. No, sir; we never do that.

Mr. Kirby: That is all.

By Mr. Mathewson:

Q. Assuming, Mr. Simpson, that gas is being made and sent out from Astoria, do you know of any way that the Consolidated Gas Company could get it to its mains in the City of New York, except by some temporary arrangement, of sending it round through the Ravenswood tunnel?

A. I know there is no other way.

Q. Pending the completion of the other tunnel direct from Astoria?

A. Yes, sir.

Mr. Kirby: There is one other question I omitted.

By Mr. Kirby:

Q. You have mentioned having taken pressure at a certain point in the city, where was that point?

A. I do not think I mentioned having taken pressure. I mentioned that I was familiar with pressures all over the city and have seen them taken.

5603 Mr. Mathewson: At the nearest lamp in reference to Mr. Macombe's complaint.

The Witness: I said I had the pressure taken there.

Q. You did not take the pressure there?

A. No; I had a *guage* set there.

Q. Did you set the *guage*?

A. No, I had set it by my orders, and the chart brought to me after twenty-four hours.

Q. Where did you have that placed?

A. The nearest lamp post to the pumping station.

Q. Where was that?

A. About forty feet west of the station.

Q. Where is the station?

A. One Hundred and Seventy-ninth Street and Amsterdam Avenue.

Q. What sort of a *guage* did you order set there?

A. Bristol Recording G*uage*.

Q. And how was it set?

A. I ordered them to set it on top of the lamp post. I ordered them to test the *guage* with a water *guage*, and if it was correct to bring me the chart.

Q. You did not do any of the work yourself?

A. No, sir.

Q. Did not attach it?

A. No, sir.

Q. Or see it attached?

A. No. I went up and looked over the ground and saw the situation at the pumping station.

WILLIAM H. WHEELOCK, recalled in rebuttal, in behalf of the complainant, testified as follows:

Direct examination by Mr. MATHEWSON:

Q. Mr. Wheelock, have you read the testimony of Messrs. Thompson and McHale and Wells?

A. I have.

5604 Q. And you observed the valuations that they gave for the company's lands between Sixteenth and Twentieth Streets and west of Tenth Avenue?

A. I noticed them, yes.

Q. As it now exists after the city improvements?

A. I noticed them, yes; I don't remember them.

Q. It is the claim of the defendants that the company is entitled to include in its capital only the portion of the land which remains. Will you state whether you agree with the valuation of these gentlemen for the defendants, and if not, what valuation you placed on those blocks from 688 to 690, inclusive, being shown on page 3 of Exhibit 48?

Mr. BURR: Let me understand. Is this what he has already testified about?

Mr. MATHEWSON: No, he has not testified. He is simply rebutting the values he gave to that particular property. We showed the value of the property as a whole, and you claimed we should be entitled to include in our capital only the portions which are left, and I am now asking whether he agrees to the testimony of your witnesses as to the value of what is left, and if not, what his valuations for those parts are.

The WITNESS: Beginning with block 688, do you want me to state what my total was before?

Q. Yes.

A. Block 688, I gave a value of $844,000.

Mr. BURR: Your first valuation was $844,000?

The WITNESS: Yes. That was prior to the taking by the city. Now, the remaining portion is $400,000.

Q. Block 689?

A. I testified to a value of $808,500 and as the block stands at present my valuation is $471,500. Shall I go on?

Q. Yes.

5605 A. Block 690, I testified to a valuation of $453,500. As the block stands at present, my value is $483,000, an increase of $29,500.

Q. That is on account of the marginal streets now making a street frontage, where originally there were interior lots?

A. Yes. Block 691, my valuation before was $340,000. As the block is at present my valuation is $186,500.

Q. Those are all the blocks which are affected by the improvement there?

A. Yes.

Q. And the difference is how much, between the valuations?

A. The net difference is $1,392,500.

Q. And if you deduct that from your original total of $15,499,500 that would leave a net now of how much?

A. $14,107,000.

Q. And in getting this difference of $1,392,500, do you not take into consideration that block—what are those which were taken out entirely?

A. Well, the two blocks that were tackn out entirely were number —I don't believe I have the numbers here, but the blocks between Eleventh and Thirteenth Avenues.

Q. Those two small triangular blocks?

A. Yes, and from Sixteenth to Eighteenth Streets.

Q. And you wipe those valuations out entirely?

A. Yes, sir.

Q. Your original valuations were $127,500 for one of the blocks and $63,000 for the other block?

A. Yes.

Q. And $297,000 for the bulkheads?

A. That is right.

Q. And those three blocks you count as zero?

A. Yes.

Q. And the net difference of all the property which you have now mentioned as originally valued by you, including lots and bulkheads, was greater than your present valuation of the same by $1,392,500?

A. Yes, $1,392,500.

5606 Q. The witnesses for the defendant had their attention called to an award of $900 per front foot for bulkhead at Twenty-second Street, but stated that they could not find that any award had been made, that being the figure to which Mr. Greene testified. Do you know whether that award was actually made?

A. Yes. I know that it was made, and that the money has been paid to the original owners of the property. The award was confirmed on April 27th, 1906, and the total of that award was $45,600. It covered eighty feet eight inches of the bulkhead running northward from Twenty-second Street, and the owner of it, to whom the money was paid, was Francis L. Ogden.

Q. Now, on page 2775 of his testimony, in regard to block 716, lot 14, Mr. Thompson put no value on building. Aren't the buildings there of value in your judgment?

A. That is on what page of exhibit 48?

Q. On page 3. It is the stables on the north side of West Eighteenth Street.

A. I put a value on those buildings of $4,000.

Q. Do you find that Mr. Thompson, in his estimate of value, if Twelfth Avenue be excluded from the company's property at the Forty-second Street plant and at the Forty-fourth Street plant, allows any corner values?

A. I could not find that he did.

Q. What would be your judgment as to an estimate if you assumed Twelfth Avenue to be excluded as to whether corner values should be allowed?

A. If Twelfth Avenue be excluded it means it is a north and south through traffic street, at least, to a certain extent, and that property facing on that street should have a value and that corners should be figured in the same way that corners are on other streets, which I figure at 60 per cent. over interior lots, and in some cases 100 per cent., but in that case 60 per cent.

5607 Q. As to Shadyside, the New Jersey property, Mr. McHale, at page 2,871, gave a certain valuation?

A. Yes.

Q. Will you state whether that is the valuation which is correct in your judgment, and, if not, what you would base your criticism on?

A. I would put a value on that property of $300,000. I was influenced somewhat by prices paid in the neighborhood that I could find out, and I took into consideration the price paid by Batterson & Eisele for the marble works just north of this property, where $120 per running foot was paid for only meadow land. I was also influenced by the fact that the railroad paid in condemnation proceedings $1,200 per lot, 25 x 100 feet, and also by the fact that the next lot north of the Batterson & Eisele marble yard, so far as I can learn, cannot be bought for $140 a running foot.

Q. What would that indicate as to Mr. McHale's valuation?

A. That, in my judgment, they are too low.

Q. On page 2,885 Mr. McHale was unable to give information as to the rent received by the city for 187 feet between 109th and 110th Streets. Can you tell what that is?

A. I think I have a record of it. The city rented to Burke & Meyer 187 feet between 109th and 110th Streets at $1,800 a year; that is, at the rate of 4 per cent. on a capital value of $45,000, or at the rate of $240 a front foot of bulkhead.

Q. Assuming that the company were to be excluded from 12th Avenue, that is the Forty-second and Forty-fourth Street plant, I want to ask you whether, in your judgment, they could obtain contig-ous or neighboring property of a similar extent for less than the valuation that you placed on the property included in 12th Avenue?

Mr. BURR: I object to that as immaterial, incompetent and irrelevant.

5608 Mr. MATHEWSON: No, the cases say that the cost of replacing is an element, almost a controlling element.

The MASTER: I do not exactly see how that comes under the head of rebuttal, Mr. Mathewson.

Mr. MATHEWSON: In this way: We are using 12th Avenue, it is conceded, and the valuation given by our witness was including 12th Avenue. Now, the defendants say you may be excluded from 12th Avenue; it is a public street. If we are excluded from 12th Avenue then we have got to get land somewhere else to use. In other words, the amount of land we require for use in our gas business. And the question is whether we could replace it elsewhere or whether the value of the land required in our gas business would be any less if we were excluded from that land, and the cases as I understand them hold that it is entirely pertinent and valuable to inquire whether the company could acquire its land, replace its land for any less than the valuation placed on the land. In other words, they desire to exclude us from 12th Avenue. If they do, we must have other land. Can we get it for any less valuation than the valuation which Mr. Wheelock placed on the 12th Avenue property?

Mr. BURR: The only question here is what was the value of the land which you claim to own. Now, the valuation was placed upon all this land by Mr. Wheelock in the beginning, and then valuations were placed on the same land by Messrs. Thompson, McHale and Wells. Now, Mr. Wheelock is called to rebut if he can, any statement that they made in regard to the value of any particular 5609 piece of property. Strictly speaking, this is not rebuttal at all; it is going over his testimony in a great degree.

Mr. MATHEWSON: Not at all.

Mr. BURR: With regard to the changed conditions——

The MASTER: Did this exclusion of 12th Avenue originate with the defendant's witness?

Mr. MATHEWSON: They asserted and claimed and put in maps showing that we cannot use that property and can be excluded at any time.

The MASTER: Not with the real estate experts, but other evidence offered on behalf of the defendant?

Mr. MATHEWSON: Yes, since our people testified; and they have advanced this and called Mr. Wells and shown our water rights and claimed that we were squatters and cannot use that land. If we cannot, we are entitled to have other property, and if we are excluded from that, according to their contention, my question is whether we could acquire a similar amount of land to use in this city for less than the valuation he placed upon the land from which we are excluded?

Mr. KIRBY: No facts have been brought forth which were not known before the complainant closed their testimony in this action.

Mr. MATHEWSON: We did not know you would make that claim.

Mr. KIRBY: You knew what the conditions were?

The MASTER: I will allow it.

Mr. BURR: Exception.

Mr. KIRBY: Exception.

A. I do not think you could replace the land for anything like the figures I have placed upon it.

5610 Q. I will ask you the same question in reference to the property shown on page 2 of Exhibit 48, being block 991.

lots 1 and 26, that is the two lots between Avenue D and Tompkins Street, and the northeasterly one-half measured diagonally of block 89, lot 26; whether, if the company is excluded from that property, it can in your judgment acquire other property contiguous or in that vicinity for anything less than the valuation you placed upon the property from which they would be excluded?

Mr. Burr: Same objection as before.
Mr. Kirby: Same objection.
The Master: Same ruling.
Mr. Kirby: Exception.
Mr. Burr: Exception.

A. I do not believe they could, I am positive they could not.

Q. Referring to block 642, lots 32 and 33 at the northwest corner of Third Avenue and 114th Street, Mr. Wells testified that he did not consider that the value of that plot was increased by the fact that it faced both on Third Avenue and on the side street; in other words, the L-shaped plot. What would be your view as to that?

A. I think there is hardly a case where property fails to enhance in value where it has an L either on a street or an avenue. There are cases where the enhancement of value is much greater owing to the improvement of the street or avenue, but as a general proposition it increases the value of the plot.

Q. Is there anything which indicates to you that this would be any exception?

A. No.

Mr. Burr: I want to say here, if you are going to pursue this much longer, this is not rebuttal——

Mr. Mathewson: I am all through.

5611 Mr. Burr: He calls witnesses to testify to the value of land and give their reasons, and they are cross-examined as to why they give certain valuations. Our witnesses are called and they are cross-examined as to the justness of their values——

The Master: But he says he is through with this now.

Mr. Burr: If he is through he is through.

Q. In the course of my examination of Mr. Wells I asked if he was familiar with the sale at 166 East 114th Street, a lot 16 feet 8 inches by 100 feet, with a building worth about $2,000 and land $6,500, sold in 1902 for $8,500, or at the rate of $12,000 for a full lot. He replied that he had no record of such a sale. Are you able to say whether there is a record of such a sale?

A. I found it in the *Record and Guide*.

Q. And the same as to Mr. Thompson. I asked him at page 2,748 whether he knew of a sale of 2089 Third Avenue in 1900 for $45,000, and he said he could find no record.

A. That is also in the *Record and Guide*.

Q. I also asked Mr. Thompson on the same page with reference to the sale of 2091 Third Avenue, 25 by 100 feet, sold in 1901, at $31,000, and he could find no record of it. Is there such a record?

A. There is in the *Record and Guide*.

—. I also asked Mr. Thompson at page 2752 with reference to the record of a sale of 126 East Seventeenth Street and 128 East Seventeenth Street, the first 25 feet 6 inches by 100 and the next 24 feet 9 inches by 100, the first sale being for $40,000 and the second for $50,000, the buildings in each case worth about $5,000, sold to the city in 1906, and he knew of no such record. Is there a record of such a sale?

A. There is in the *City Record* of June 27th, 1906.

Q. To whom?

A. To the City of New York.

5612 Mr. Burr: What was the date?

The Witness: The record of June 27th 1906.

Q. I also asked Mr. Thompson, at page 2754, as to a sale at 174 Hester Street, between Mulberry and Mott, 25 x 100 feet, with old three-story buildings of no value, selling in 1905 at $26,500. No record was found by Mr. Thompson?

A. It is also found in the *Record and Guide*.

Q. I likewise asked Mr. Wells in reference to the record of a sale of No. 518-524 East Sixteenth Street, between Avenues A and B, 75 feet by 103 feet, with four old buildings, sold in 1906, at about $50,000; buildings worth about $3,000 each, and Mr. Wells stated that he found no record. Do you find such a record?

A. I have such a record. It did not come from the *Record and Guide*, however, I know it to be a fact that the price quoted of $50,000 is correct.

Q. That would leave about $38,000 for the land, or $7,250 a lot?

A. Roughly, yes.

Q. I also asked Mr. Thompson, at page 2758, as to the record of a sale of 606 East Fifteenth Street, between Avenues B and C, 25 x 100 feet, with an old four-story tenement.

A. Yes, I have that.

Q. For $11,500, building about $2,500?

A. Yes, roughly.

Q. And so, too, as to 606 East Fourteenth Street, between Avenues B and C, a lot 25 x 100 feet, sold at $15,825 in 1904. Mr. Thompson was unable, at page 2760-1 to inform me as to that. Is there a record of such a sale?

A. There is, in the *Record and Guide*.

Q. And the value of the building in that case is about $4,000?

A. Yes, sir, roughly.

Q. Now, at page 2771, I asked in reference to a scale of 455 West Sixteenth Street, between Ninth and Tenth Avenues, lot 25 x 92 feet, with two-story frame building of no value, which was sold in June, 1906, and he could not give the price. Are you able to state or have you found a record?

5613 A. I know that the price was $13,250. It does not appear in the *Record and Guide*.

Q. Now, I asked Mr. Wells, at pages 4319-20, as to a sale of 436-438 East Nineteenth Street, between First Avenue and Avenue A, 50 x 92 feet, vacant, sold in 1904 at $16,100, and Mr. Wells could find no record of it?

A. It is in the *Record and Guide*.

Q. So, too, on page 2794, I asked Mr. Thompson in reference to

537-9 West Fortieth Street, between Tenth and Eleventh Avenues, a lot 50 feet wide by half the block, with one story sheds of no value, selling in 1901 at $16,000. Mr. Thompson had no record. Is there such a sale?

A. It is in the *Record and Guide*, yes.

Q. At page 4329, I inquired of Mr. Wells as to a sale of lots 1617 and 1619-1621 Eleventh Avenue, between Forty-fifth and Forty-sixth Street, 75 x 100 feet, vacant, sold in 1906 at $37,000. Mr. Wells had no record. Do you find a record of such a sale?

A. There was a nominal consideration given in the *Record and Guide*, but I know that the price was as stated, $37,000.

Q. Now, I also inquired of Mr. Wells and of Mr. Thompson in reference to 1108 First Avenue, Mr. Wells at page 4320, and Mr. Thompson at page 2798, the sale being between Sixtieth and Sixty-first Street, 25 x 100 feet, with a one-story shed of no value, selling at $10,000 in 1905. Mr. Wells had no record and Mr. Thompson was not able to state the price of the sale.

A. It is in the *Record and Guide*.

Q. As stated, at $10,000?

A. Yes, as stated at $10,000.

Q. I called Mr. Thompson's attention to a sale on Sixty-sixth Street, north side, fifty feet east of the railroad tracks, 40 x 100 feet, sold in 1906, at $13,000, vacant, at the rate of $8,100 per lot, and Mr. Thompson, at page 2800, stated that he had no
5614 record, and Mr. Wells, at page 4333 had no record. Do
you find that recorded?

A. There is no consideration given. I was mixed up on that sale, but I know that the price was as stated.

Q. I also inquired of Mr. Thompson, at page 2801, in reference to the sale of 227-231 East Ninety-eighth Street, between Third and Second Avenues, 75 x 100 feet, sheds of no value, sold in 1905 at $40,000, or at the rate of $12,500 per full lot, and Mr. Thompson stated that he had no record and Mr. Wells, at page 4336 similarly stated. Is there a record?

A. It is not a *Record and Guide* quotation. The Title Guarantee and Trust Company, who drew the deed and searched the title, gave me the price.

Q. As stated?

A. As stated.

Q. Also at page 4339 I called Mr. Wells' attention to 308-322 East 110th Street, west of First Avenue, opposite the gas company's property, with sheds of no value, sold in 1905, at $74,550, or at the rate of $10,650 per lot. Mr. Wells, at page 4339, stated that he had no record of that.

A. I don't know whether that is a *Record and Guide* sale or not. We were half brokers in that, and the price is as stated.

Q. I also, at page 4340, inquired of Mr. Wells as to a sale between Broadway and Twelfth Avenue, south side of 137th Street, vacant, in 1904, for $50,000, or at the rate $8,800 per lot, and Mr. Wells had no record. Do you find any record?

A. It comes from the *Record and Guide*.

Q. Did you observe the method pursued by Mr. Wells and Mr.

Thompson and Mr. McHale in reference to plottage, stating that they included the plottage in individual lots without figuring first the value of a parcel on the ordinary basis, and then adding a percentage for plottage?

A. Yes.

Q. You have read that?

A. I have read that testimony.

5615 Q. In your judgment is that a proper or approved method of estimating the value of a plot, including plottage, a large block?

A. I can only say that it is my custom and also the custom of our office, and in a great many other cases I have heard of, to take a unit value and plottage in those cases is added after, as a last final touch to the figure.

Q. Are you familiar with such a method as was employed by these gentlemen?

A. No, personally, not.

Q. Has the individual lot itself any plottage value?

A. No, I cannot see that it would have.

Q. Now, the defendant's witnesses, one of them testified as to the sale of the bulkhead property to Dugro above Forty-ninth Street; are you able to find any record of that sale?

A. I find no record in my office. I have also applied to the people who attend to Judge Dugro's real estate work, as a rule, I don't know as they would in this case, and I cannot find any record of this, and neither has the Lawyers' Title Company, nor the Title Guarantee Company.

Q. You have made investigations and inquiries so far as you could and could not find it?

A. I would not say so, so far as I could, but where I usually go to get records, and they have not it.

Q. Assuming that a sale was made without any additional or unexpressed consideration at the figure suggested, would a single sale of that character in view of the other sales and leases with which you are familiar and to which you testified, be a true criterion to the value of bulkheads?

A. I can only answer in this way, that finding the sales and leases which I did, if I came across a sale of this kind at the price given I would have to know all about it before it would influence me, because it is very much below anything that I could find.

Mr. Mathewson: That is all.

Cross-examination by Mr. Burr:

Q. Mr. Wheelock, you know Messrs. Thompson and McHale, I suppose?

5616 A. I have met Mr. McHale in connection with Columbia College work some years ago, and Mr. Thompson I saw here for the first time when he testified.

Q. Do you know them in the real estate business; do you know Mr. McHale?

A. Yes, sir.

Q. And you know his connections and associations in the real estate business?

A. Yes.

Q. Do you think he is a competent real estate expert?

A. He is so thought.

Q. I suppose your attention was specially directed to their testimony by counsel for the complainant, after they had testified?

A. I heard some of Mr. Thompson's testimony and the rest I read.

Q. Read for any special purpose?

A. To acquaint myself with it.

Q. In other words, you were notified that you might be called upon to rebut their testimony?

A. Yes.

Q. And with that in view you familiarized yourself with all they had said in regard to this property?

A. Yes.

Q. And with regard to these sales that Mr. Mathewson has called your attention to, you hunted up the records as far as you could and you found these in the *Record and Guide,* that you have spoken of being in the *Record and Guide?*

A. Yes, prior to my own examination here before you.

Q. There are some, I understand you to say, you did not know about yourself?

A. No.

Q. Now, were they in the *Record and Guide?*

—. I said there were some not in the *Record and Guide,* but which I myself personally or my office did know about.

Q. Which are those?

A. The first one I testified to this afternoon, I think, was 518-24 East Sixteenth Street, the next one 445 West Sixteenth Street. The next was 550 West Fortieth Street. I think I testified to that
5617 one. The next was Sixty-sixth Street, on the north side, fifty
feet east of the railroad track. The next 227-231 East Ninety-eighth Street. I think that is all. There may be one more, but I did not find it. The rest were all *Record and Guide* sales.

Q. Well, I understood you to say that you knew that $1,800 was the rent received by the City——

A. Oh, well, that is a lease.

Q. For 187 feet between 109th and 110th Streets?

A. Yes.

Q. Do you mean to say you know that of your own knowledge?

A. Neither of the tenants told me so; I find a record of it.

Mr. Mathewson: Where do you find a record of it?

The Witness: In the Dock Department's books; I cannot give you the page.

Q. Do you know what were the conditions of that lease?

A. No.

Mr. Burr: I move to strike out the testimony in regard to that.

The Witness: I only know it was a two-year lease at $1,800 a year.

Mr. Burr: The witness testified with regard to 187 feet between

109th and 110th Streets as to the rent received by the city. It now appears that that is in the shape of a lease, and I asked him if he knew the conditions which were stated in that lease and he states that he is entirely unfamiliar with the conditions, and all he knows is the amount, and I move to strike out his testimony in that regard.

Mr. MATHEWSON: No, he said he knew it was $1,800 a year for a two years' lease, and he found the record in the Dock De-
5618 partment Records of the City of New York.

Mr. BURR: If he is going to testify about that at all, it is not within his own knowledge and he cannot speak except as to the amount, and there being a written lease, the lease is the best evidence, and I move to strike it out.

Mr. MATHEWSON: You produced your own Dock Department records and proceeded to testify as to leases from those very books, and your witness, McHale, testified he could not find the record of such a thing, and that he did not know the rent received, and I asked him if he knew the recent received and he said he did, and he found it in your own books.

Q. Do the terms and conditions appear in the books which you looked at?

A. No, simply the term of the lease and the amount of the lease and the name of the tenant and dimensions of the property.

Q. Did you say you got that from a book or from one of the tenants?

A. I say I did not get it from either of the tenants. I got it from the Dock Department Records.

Mr. BURR: I move to strike out his testimony, the lease being the best evidence, and containing the terms and conditions under which the rate of rental is fixed.

The MASTER: I will let it stand. Of course, the lease would be the best evidence, no doubt about that.

Mr. BURR: Give me an exception.

Q. Now, these various parcels which you have described as not being in the *Record and Guide*, but of which you had knowledge, what kind of knowledge did you have?

A. In some instances, either I myself, or my office acted
5619 as broker or part broker.

Q. Which ones did you act as broker?

—. I have given them already in the testimony.

Q. 518 East Eighteenth Street, did your firm act as broker there?

A. What number is that?

Q. 518, 520, 522 East Eighteenth Street?

A. We were interested in that sale.

Q. Well, interested in knowing that it went through? or how? Or in knowing the price?

A. Knowing the price.

Q. I assume you are interested in all sales in knowing the price. Did you have any special interest in this?

A. Largely where we are paid for putting them through.

By Mr. Kirby:

Q. How were you interested in this case?

A. Being paid a commission for putting it through.

By Mr. Burr:

Q. You helped put it through and you were paid for acting as broker?

A. Yes, sir.

Q. Does that apply to 445 West Sixteenth Street?

A. No, I don't think we had anything to do with that sale.

Q. How do you know what the consideration was in that sale?

A. My knowledge of that sale and several that are here comes from the company with which we are connected. We have records of the contracts that are closed in that office, that is the Title Guarantee and Trust Company, where the contracts are drawn by them and where we have access to those contracts.

Q. Do you mean to say there is a written contract in existence?

A. On file, yes, sir. The title has gone through long ago, but the copy of the contract is there or the original, as the case may be.

5620 Q. Did you see the original contract there?

A. I did not, no.

Mr. Burr: I move to strike out his testimony as to that.

Mr. Mathewson: Real estate experts qualified here by asking them whether they are familiar with the sales through their own offices, by examination of the *Record and Guide* and other sources of information, and they always qualify by showing such general familiarity. The defendant's witnesses testified as to the same things, and here is the *Record and Guide*, which is testified as being the established record to which real estate men have recourse, repeatedly quoted by the defendant's witnesses on the stand as to what they found, and any sources of substantial inquiry, recognized sources of inquiry and pertinent in a case of this kind. What weight is to be given to them is another proposition, and I submit that the motion to strike out should not be granted. For whatever they are worth, they are here and they are the recognized and only way in which you can reach a valuation.

The Master: It would seem proper to me, I think that motion will have to be granted.

Mr. Mathewson: Exception.

Q. Now, as to the Sixty-sixth Street piece of property, how did you obtain your information there? Were you a broker there?

A. We were part broker in that sale and received a share of the commission.

Q. Did you assist in the negotiations looking to the sale?

A. Yes.

Q. Did you assist at the close of the sale?

A. I don't remember whether our office was represented at the passing of title. We certainly negotiated the drawing of 5621 contracts and exchanging of them and signing of them. We rarely attended to the passing of title.

Q. What kind of property was that?

A. Vacant property.

Q. Can you produce the contract?

A. No, we do not keep any contract. We are only brokers.

Q. Well, will you produce the contract?

A. Only with the permission of the buyer and seller.

Mr. Burr: I move to strike out his testimony with regard to that property also.

Motion denied. Exception.

Mr. Kirby: The State also excepts.

Q. Now, as to 550 West Fortieth Street?

A. I think we have no interest in that. I do not think we have any interest in that.

Q. What is the source of your information there?

A. Title Company again.

Q. You were informed by someone in the Title Company that such and such an amount was paid?

A. I would like to say that we get a great many figures from the Title Company in this way: That Mr. Charles S. Brown, my senior, is President of the Bond and Mortgage Company, a subsidiary company of the Title Guarantee & Trust Company, and that he passes on all the loans made by the Title Guarantee & Trust Company of property which is closed in their office, and that large lists of sales are submitted to him every week, with lots of plots or single properties mentioned, the prices at which they are being sold for the mortgage which is wanted by the person buying, and although the statements that come to us from the Title Guarantee & Trust Company are not sworn to, we take them as being correct authority for it, for we have found that in a large number of cases the 5622 prices shown on that list are accurate. The values we suppose are just as accurate as those we happen to know about.

Q. But the terms and conditions under which a piece of property is bought——

A. We know nothing as to terms or conditions governing the sale of the property.

Q. But that has a great deal to do with the sale, the terms and conditions existing?

A. There are a great many sales where a special feature or special condition will cause the price to be high or low.

Q. You would not venture an opinion upon a piece of property, would you, unless you knew all about it?

A. Certainly I would. I would know whether the price paid was fair. The *Record and Guide* sales usually show the prices paid.

Q. You would not venture an opinion upon property unless you knew all about the property?

A. No.

Q. And if your attention was called to a sale of property in that neighborhood or thereabout to affect your judgment, you would want to know all about that sale, wouldn't you?

A. I should if it differed very much from the values which I believed to rule.

Q. And as a matter of fact, you do not know anything about the terms and condition of this sale other than the price?
A. No, I do not.

Mr. Burr: I move to strike out his testimony with regard to that piece of property.
Motion granted. Exception to Complainant.

By Mr. Mathewson:

Q. Is this one where you have the record in your office?
A. No, this is not, except as it comes from the Title Guarantee & Trust Company for the purposes of mortgage. It is a statement made by the Title Guarantee & Trust Company of the price paid.

5623 Mr. Mathewson: Exception.

By Mr. Burr:

Q. Now, take 227 and 231 East Ninety-eighth Street. Did you act as broker there yourself?
A. No.
Q. You did not have that sale?
A. No, not personally.
Q. Where did you get your information?
A. I will tell you in just one minute.
Q. Is that 227 to 231?
A. Yes. That comes partly through the Title Guarantee & Trust Company and partly through the broker who did make the sale.

Mr. Burr: It was hearsay, and I move to strike it out.

By Mr. Mathewson:

Q. Was that according to the *Record and Guide?*
A. No, sir.

The Master: Strike it out.
Mr. Mathewson: Exception.

Q. As to all the pieces of property which Mr. Mathewson claimed he cited as comparisons to the experts for the State and City, you obtained your information regarding those from the *Record and Guide,* if I understand you correctly?
A. I did, yes, sir.
Q. And you know nothing at all about those pieces of property except the consideration as it appears in the *Record and Guide?*
A. I don't think there is a single one where I know anything about the conditions governing the sale.

Mr. Burr: I move to strike out his testimony with regard to those.
5624 Mr. Mathewson: May I ask a question or two of the witness?
The Master: Yes.

By Mr. **Mathewson**:

Q. Is the *Record and Guide* the recognized organ of real estate transactions in the City of New York?

A. Yes.

Q. Is it constantly consulted and relied upon by brokers and real estate dealers with regard to property sold and prices received?

A. Yes, sir.

Q. Is it the same record to which you and the witnesses for the defendant referred as the *Record and Guide* when they mentioned it?

A. Yes, sir.

Mr. **Mathewson**: If the Master please, the question is put to the witness——

The **Master**: You need not argue. Motion denied.

Mr. **Burr**: Exception.

Mr. **Kirby**: Also objected to as not rebuttal, and I except.

Q. You say Batterson & Eisele, the marble works there, paid $120 per running foot there for meadow land at Shadyside?

A. Yes, sir.

Q. Where did you get that information?

A. That is indirect information from the broker who made the sale; also a record of it in the Jersey office, which I have not myself seen.

By Mr. **Mathewson**:

Q. What Jersey office—of your firm?

A. No, I mean in the record office. I have not seen that. I have a record of the page——

By Mr. **Burr**:

5625 Q. So you know nothing about it as to the terms and conditions except you were informed by the broker who made the sale?

A. That is all. That also applies to the condemnation proceeding; there is a public statement of the price paid, which I have not seen.

Mr. **Burr**: I move to strike out that testimony.

The **Master**: I cannot tell about that unless I see exactly what they say about it.

Mr. **Burr**: You mean in regard to Shadyside.

The **Master**: Yes. My copy of the testimony is at the binder's. I will let it stand for the present and you can make another motion in a brief or at the close of this matter when I get the record here in this case back. I do not recall what those gentlemen said or what investigation they had made as to their sales, or what knowledge they had of sales in connection with the Shadyside property. If their testimony as a whole was to the effect that they did not know of any other sales over there, and Mr. Wheelock testifies here that the sales are a matter of record, I would be disposed to let it stand.

Q. Did you find that Shadyside sale to Batterson & Eisele before you testified here that first time?

A. Yes, I did.

Q. Do you know where Batterson & Eisele are now? They are located in that neighborhood, I mean?

A. Yes; they are approximately—well, as near as you can judge by land over there, I should say three long blocks north along the river front—as well as you can divide into blocks out there.

Q. They have a plant right there?

A. Yes. Marble works.

Q. This is rather an extension of the existing plant?

5626 A. I judge not. I judge that—yes, I think it is. The buildings which they have there are much older than the sale recorded.

Q. Now, as to the condemnation proceedings which you said you had received information from other people, what information did you receive in regard to them?

A. The Standard Oil Company property over there, and part of that was taken by the railroad; and also——

Q. That is, you were informed?

A. This I know to be a fact, that it was taken. I also know that two other strips of property were taken there. I don't know whom they belonged to. I was told of that. I can say the strips were taken, however, and the record shows it, which I have not seen, but which I am told brought $1,200 a lot.

By Mr. MATHEWSON:

Q. You mean the record in the public office?

A. Yes.

By Mr. BURR:

Q. You did not see the public record, but you were told that was the price paid?

A. Yes.

Q. How recently were you there?

A. I should say about three weeks before I first testified, roughly; that was the time I was over there.

Q. And by whom were you informed?

A. By one of the commission who acted as part broker in the sale of part of the land and acted as expert in this proceeding.

Q. But that is the sole information you have?

A. That is the only information I have.

Mr. BURR: I move to strike out his testimony with regard to that.

5627 The MASTER: I make the same disposition as to that. I will let it stand for the present until I look at the record in this case.

Exception.

Q. Now, you gave a valuation of $4,000 for cer-ain buildings that Mr. Thompson would not put any valuation on at all. Why did you value them at $4,000.

A. Because, in my opinion, they were buildings that were useable, rentable, suitable to the neighborhood that the owners if they did not choose to use them could rent them. I think that was in Eighteenth Street, north side, if I remember rightly, wasn't it?

Q. Yes. Do you know if there is any basement to that building?

A. I don't think there is in either of the buildings there.

Q. Do you know if there is any roof on it?

A. Yes, I know there is a roof on both. There was when I was there. I don't know that there is to-day.

Q. When were you there?

A. During the month prior to my first testimony.

Q. What is it used for?

A. Building on the east side, two-story brick stable, 20 x 92—12 stalls on ground floor, hay above. On the west side, two-story brick building in front on the street used as a garage, size approximately 25 x 28. Second floor used for living rooms of the firm. In the rear of this are sheds of frame, and tar roof.

Q. Have you just merely put a valuation on the brick and mortar that constitutes the buildings or have you put a valuation considering the business they are adapted for and the probable amount they earned?

A. The latter is the basis on which I figured them.

Q. What would stalls rent for in that neighborhood?

A. I should suppose——

Q. No, do you know?

A. No, I don't know.

5628 Q. You never rented a stall or stable over there in that neighborhood, did you?

A. I think not.

Q. Are you quite sure?

A. Positive.

Mr. Burr: I move to strike out his testimony with regard to that. Motion denied. Exception.

Q. With regard to this Francis L. Ogden award, you say there was a bulkhead 80 feet 6 inches which on April 27, 1906, was paid for at the rate of $900 per foot, making a total of $45,600?

A. I believe that was the total, yes.

Q. Will you figure up 80 feet 6 inches at $900 per foot? Have you got your dimensions correct?

A. Well, I thought I had. I copied it from my map, but very possibly I am in error. That does not multiply up straight.

—. How much does it amount to?

A. The award was on the basis of $900. My multiplication is wrong. I would like a chance to correct that from my own record- in my office. I have not got them here.

Q. I won't pursue that, with that understanding, that you may have an opportunity to get the correct figures. Now take Block 688. You say that you valued it as it was at $844,000 and as it is at $400,000. Will you give us the basis of this later valuation?

A. That is the most southerly block.

Q. Well, whatever you have it there?

A. 688?

Q. Yes.

A. The length of that block on West Sixteenth Street is 286.21

feet, according to this description. On the marginal street it is 195 feet. On Seventeenth Street I make it 357.29 feet and on Tenth Avenue 184 feet. I take a unit of value for the marginal street of $15,000, for Sixteenth Street of $11,500, for Seventeenth Street of $11,000, for Tenth Avenue $15,000. On the marginal street, the
junction of the marginal street and Sixteenth Street I divide
5629 it into a corner 25 x 100, which at a price of $15,000, plus
50 per cent. for the corner, makes $22,500. I add for extra
depth $562, or a total of $23,062.

The interior lot remaining upon the marginal street being 72 feet 6 inches by 100 feet I value at the basis of $15,000 a lot or $600 per front foot, at $43,500, the average depth being 120 feet I add $4,350, which is 10 per cent., and make that plot $47,850; or for the corner of marginal street and Sixteenth Street 100 by 97 feet 6 inches on the marginal street, irregular, $70,912.

Tenth Avenue frontage, two corners at a unit of $15,000, plus 50 per cent., or $4,500.

There are 134 interior front feet at the same unit of $15,000, or $600 per front foot, making $80,400, or a total for Tenth Avenue of $125,400.

On Seventeenth Street there are 86.31 feet by 92 feet in depth, which I now considered to be 100 feet, at the rate of $440 per front foot equals $37,972. I then deduct for depth 3 per cent., or $1,139, making a total of the plot 86.30 by 90 feet, $36,833.

The next on Seventeenth Street is a plot 71 by 92 by 35, average width 53 feet, so we have a plot 53 by 100 at $440 per front foot, which equals $23,320. Then adding because of the width in front $3,000 we have $26,320, and deducting 3 per cent. for the depth of the plot, which is only 92 feet, we have a total for a plot 71 by 92 of $25,531, or a total for Seventeenth Street of $62,364.

On Sixteenth Street there are 86.21 feet by 100 feet in depth, which at $460 per front foot equals $39,652, and taking 3 per cent. off for the shortness of the lot we have a total for Sixteenth Street of $38,463, or a total for the block of $363,139, to which is added 10 per cent. for plottage, making a total of $399,452, which I have called $400,000.

Q. You add your plottage at that point, do you?

A. Yes, sir.

5630 Q. That is your method of computation, so far as plottage is concerned?

A. Yes, it varies in various cases, the amount of plottage, but the method is the same.

Q. Is that the method pursued by Mr. Thompson and Mr. McHale?

A. No, I think not.

Q. You said you and your firm pursued a method satisfactory to you, but you do not mean to be understood as claiming that because they have adopted that method that every person adopting another method would be at fault?

A. Not at all. I said we had adopted it and used it and a great many others did; I have heard of various methods, but we prefer this one.

Q. This is the method you have adopted, however, as an appraiser, is it?

A. Yes.

Q. During all your experience?

A. Yes.

Q. How long has that been?

A. I cannot state exactly when that began, but in various proceedings which are on record in the last four or five years and before that in my own office—I was able to judge of value.

Q. I mean since you have been acting and testifying as an appraiser?

A. Yes.

Q. The past four or five years?

A. Roughly.

Q. You would not say three years, would you?

A. No, I would rather not.

Q. Now, your former valuation of block 689 was $808,500?

A. Yes.

Q. And you value it at the present at $471,500?

A. That's right. The value is arrived at in the same way.

Q. What is the reason for the difference?

A. The reason for the difference is that the block as it now appears on the map is smaller than it originally was.

Q. To what extent?

A. On West Seventeenth Street 380.47 feet as against 800
5631 feet originally. On Eighteenth Street there are now 451½
feet, roughly, as against 800 feet. That is the difference in size, without going into the angles.

Q. I would be obliged to you if you would give me the exact dimensions of the property as you figured on the basis of $808,500, and the exact dimensions of block 689 as you figure it to-day?

A. Certainly. On the basis of $808,500 the dimensions were then 800 x 184. The dimensions now are 451.55 on Eighteenth Street, 184 feet on 10th Avenue, 380.47 feet on Seventeenth Street, and 195 feet on the marginal street. There may be an inch more or less on the marginal street because it is a diagonal line.

Q. Before we proceed with that further, give me the dimensions of block 688 as it existed when you valued it at $844,000, and what the present dimensions are?

A. Originally 800 x 184, and now the dimensions on West Sixteenth Street are 286.21 on Tenth Avenue 184 feet. On Seventeenth Street 357.29, and 195 feet on the marginal street.

Q. Now, be kind enough to proceed and give me the details of your present valuation of block 689?

A. My marginal street unit is $14,500; Seventeenth Street, $11,000; Eighteenth Street, $10,500; Tenth Avenue, $14,500.

Considering first the corner of marginal street and Seventeenth Street the corner itself 25 x 100, the unit is $14,500, plus 50 per cent. or $21,750; adding for depth $543 we have $22,293.

The plot north, being an interior plot, 72 feet 6 inches in front, at the rate of $580 per front foot, which is the same unit, $42,050; adding 10 per cent. for an average depth of 120 feet, $4,205, or a total of $46,255; making a total for the corner of the marginal street and Seventh Street $68,548.

5632 The corner, corner of marginal street and Eighteenth Street, the corner itself, 25 x 100, the unit is $14,500, plus 50 per cent., which equals $21,750.

The interior plot, 72 feet 5 inches x 100 feet, at $580 per front foot, which is the same unit, equals $42,050, or a total for that half of the marginal front of $63,800.

On Tenth Avenue there are two corners, the unit is $14,500, plus 50 per cent., which equals $43,500.

An interior, 134 feet, $580 per front foot, total, $77,720, or a total for the Tenth Avenue valuation of $121,220.

On Eighteenth Street there is first a plot 180.50 feet at the rate of $420 per front foot, which is the unit of $10,500 per lot, equals $75,810. Deducting on account of the shortness of the lots $2,274, we have a total of $73,536.

The next plot on Eighteenth Street, 71 x 100 x 35, average in width 53 feet, considering the plot, therefore, as 53 x 100 feet, at $420 per front foot, equals $22,260; adding for the extreme width in front $3,000, makes $25,200, and deducting on account of the shortness of the lot we have $24,500, or a total for Eighteenth Street of $98,036.

On Seventeenth Street, 180.5, at the rate of $440 per front foot, equals $79,420; deducting 3 per cent. for depth we have $77,038, or a total for the block of $428,642, to which is added 10 per cent. for size, making a total of $471,506, which I have called $471,500.

At 5.05 p. m. an adjournment was taken to Wednesday, January 16th, 1907, at 11 a. m.

Last Exhibits:

Complainant's, 296.
State's, 000.
City's, 236.

5633 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; **William Travers Jerome**, as District Attorney of New York County; **Frederick E. Gunnison**, **John C. Davies**, and **Lucian L. Shedden**, Constituting the New York State Commission of Gas and Electricity, and **The City of New York**, Defendants.

Before Arthur H. Masten, Special Master.

January 16th, 1907.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

5634 **William H. Wheelock** resumed.

By Mr. **Burr**:

Q. I think we finished last night, Mr. Wheelock, with your detailed statement with regard to block 689. Will you be kind enough to give me the accurate dimensions of block 690 as it was when you placed the valuation of $453,500 on it?

A. On 18th Street the property faced 525 feet; on the westerly line it was 184 feet; on the easterly line it was 184 feet; and the total of the 19th Street block was 400 feet. There were various lots out on 19th Street. At present the block is 474.73 feet in length on 18th Street, 195 feet on the marginal street and 184 on Tenth Avenue and 525 feet on 19th Street, deducting 125 feet for the plots marked out, or 400 feet owned by the gas company on that street.

Q. Your present valuation is $483,000, is it not?

A. $483,000.

Q. Will you give me the details of that $483,000, Mr. Wheelock?

A. I used a unit on the marginal street of $14,000; on the 18th and 19th Streets, $10,500, and on Tenth Avenue $14,000. Beginning at the corner of the marginal street and 18th Street, the corner is 25 feet by 100; the unit of $14,000 plus fifty per cent. equals $21,000; adding for extra depth 2½ per cent., we have a total for that corner alone, $21,525.

The next plot to the north is 72 feet 6 inches by 100, which at $560 per front foot, or $14,000 a lot, figures $40,600; adding ten per cent. for extra depth, being an average of twenty feet, we have for that plot seventy-two feet six inches by 120, $44,660, making a total of $66,185.

The corner of the marginal street and 19th street is divided as
follows: Corner lot 25 x 100 feet at the unit given plus fifty
5635 per cent., equals $18,000, $3,000 being taken out for the loss
of the corner itself. The next plot, 72 feet 6 inches x 100

at $560 a front foot, being the original unit of $14,000, equals $40,600, or a total of $58,600. On Tenth Avenue, the two corners which have a unit of $14,000, plus fifty per cent., equals $42,000. The interior 134 feet, $560 per front foot, equals $75,040, or a total for the Tenth Avenue frontage of $117,040.

The 18th Street frontage, there are 274.75 feet at $420 per front foot, or a unit of $10,500 per lot, equals $115,395. Three per cent. is deducted on account of the shortness of the lots, making a total of——

Q. How short is it?

A. Ninety-two feet deep, making a total for 18th Street of $111,936.

On 19th Street there are 274.75 feet minus 125 feet owned by other individuals, which leaves a balance of 149.75 feet owned by the Gas Company, which at $420 per front foot equals $62,895; three per cent. being deducted for the shortness of the lots, which are again ninety-two feet deep, we have $61,009.

The next lot, 71 x 135 feet, shows an average width of 53 feet, therefore 53 by 100 feet at $420 a front foot equals $22,260; on account of the extra width in front, I add $3,000, making a total of $25,260; and deducting three per cent. for the fact that the lots are only ninety-two feet deep, $24,503, or a total for the 19th Street frontage of $85,512. Total for the block $439,273, to which is added ten per cent. for size, making a total of $483,200, which I have figured at $483,000.

Q. Upon what basis do you deduct three per cent. from a lot that is 92 feet long?

A. It is more or less a matter of individual judgment, partly based on scales.

Q. What scales?

A. Our own scales; not particularly made by anybody.

5636 Q. Does that apply to a similar deduction in block 689 and 688 and all throughout?

A. Yes, I have used that throughout.

Q. Give me the dimensions of block 691?

A. 691 originally was 350 feet on each street by 184 feet on 11th Avenue and 184 on the easterly line. At present it is 119 feet on 19th Street, 190.08 on 20th Street, 184 feet on the easterly line and 195 feet plus or minus a few inches on the marginal street.

Q. Will you give me the details of your valuation?

A. The unit on the marginal street is $14,000; on 19th Street, $10,500; on 20th Street, $11,000. Using the marginal street we have two corners plus 50 per cent. added to the unit value of $14,000, makes $42,000. 145 interior feet at $560 per front foot, or the original unit of $14,000 per lot, equals $81,200 or a total for the marginal street front of $123,200. On 19th Street there is a plot 19 x 100 x 54½ x 100 which therefore averages 36 feet 9 inches x 100, which at the rate of $420 per front foot or the unit of $10,500 per lot, makes $15,435. There is deducted $1,250 because of the width in the back and narrowness of the lot in front, making a total of $14,185. Three per cent. is again deducted on account of the lots being 90-2 feet deep, and we have $13,760 as the total for 19th Street.

On 20th Street there is left a lot 90 x 100 x 54½ feet x 100, or an average of 72¼ x 100, which at $440 per front foot or $11,000 per lot equals $31,790. The sum of $2,000 is added for extra width on the street making $33,790. Three per cent. is again deducted for the shortness of the lot making a total for 20th Street of $32,777, or a total for the block of $169,737. To this is added the same amount for size, making a total for the block of $186,710, which I have made $186,500.

Q. I think those were all the plots that you re-appraised?

A. Yes.

5637 Q. Being back to block 688 and the valuation that you
placed upon the different lots comprising that plot, will you
tell me how you arrived at your lot valuation?

A. Unit values do you mean?

Q. Yes.

A. Well, a great many things make up unit value.

Q. Well, in that particular case what entered into your mind?

A. The result of my inspection of the neighborhood, and the character of the property and what I saw going on, and what sales I could find and what records we had.

Q. For instance, will you tell us what you saw going on?

A. Very little change in the last three or four years; tenement houses, some stables and some factories, and a tendency to grow up in factories.

Q. Will you tell me what new factories you saw going up there?

A. I don't know that I can name them. There was one built by the National Biscuit Company which occupies the entire front of the block; I am not sure what block it is, but it is within two squares of this property.

Q. How new is that factory?

A. I should say it was just being completed.

Q. How far away is that factory from the property on block 686?

A. I said I could not give the exact location; I think within two squares. I have not been to the property since before my last testimony.

Q. I presume you mean two blocks by two squares?

A. Yes.

Q. Did you see any other improvements taking place in the neighborhood?

A. I saw the improvements being made by the city, the marginal street and new wharves.

Q. What improvements did you see being made by the city?

A. Simply the work going on in making the marginal
5638 streets and the completion of the wharves, those that are not
already finished; the paving of the marginal street was not
being made at that time and I doubt if it is now.

Q. Then you simply surmised that the improvement in the marginal street was going to be made?

A. No, I found that the property had been taken by the city, the streets laid out and fences erected.

Q. Had the streets been laid out physically, Mr. Wheelock?

A. I don't know that I can define the term "physically"; if you mean that wagons are going through?

Q. Yes.

A. They are; with difficulty, yes.

Q. Now, that marginal street that you refer to; you say a wagon could get through with difficulty?

A. Yes.

Q. Did you see any wagon going through there?

A. Yes, I saw some ice wagons going through there.

Q. That is, going down to the dock, was it not, crossing the street?

A. I cannot remember what streets I saw them going between, but they were going north and south—16th or 17th Street.

Q. You did not see any wagons going in the direction of 20th Street from 16th Street through that street, did you?

A. It was either 16th or 17th Street where I saw the wagon going.

Q. As a matter of fact, is not that street fenced up?

A. Not that I remember, when I was there.

Q. When were you there?

A. I walked through or along the marginal street from the beginning of the company's property to the end of it.

By Mr. MATHEWSON:

Q. You did not climb any fences?

A. Not that I remember.

By Mr. BURR:

Q. You did not see any fences?

A. Not at those points, no, sir; there may have been south of it.

5639 Q. Where did you see the fences?

A. I did not see any, except the fences that were built between the blocks dividing the streets from the prop-rty which had been taken; there were some rough board fences there, but they did not interfere with travel north and south with me, going the same direction.

Q. Block 691, between 19th and 20th Streets, can you tell me where the nearest improvement is to that block?

A. Well, what do you mean, tenements or——

Q. Any kind of an improvement. What do you mean by an improvement?

A. There are structures directly opposite, on 19th Street.

Q. What kind of structures?

A. Old buildings, some sheds and some three-story tenements, and —well, that is the character of the improvement on the north side, I should say, of 19th Street, as I remember it.

Q. Would you describe it as an adequate improvement in that neighborhood?

A. In that location I should think that factories might be a better form of improvement even now.

Q. Were they not very old buildings?

A. Yes, sir; most of them very old.

Q. They are cold water tenements, are they not, as a matter of fact?

A. Yes, I doubt if there is any modern tenement.

Q. Are they not known as barracks?

Mr. Mathewson: I object to that.

Mr. Burr: They are the oldest kind of cold water tenements.

The Witness: There were very poor buildings in the neighborhood.

Q. With regard to block 690, where are the improvements there?

A. I think on the most easterly plot marked out on that map that there are two old buildings, that is my recollection; and the
5640 single lot next width to that, which is marked out, my impression is that it is vacant.

Q. What was left of that?

A. I don't remember.

Q. That I see you have also marked out?

A. Yes, it is not owned by the gas company.

Q. Is not that an old four-story tenement house?

A. It may be; I am not clear as to that, I don't remember that very accurately.

Q. Those buildings, would you characterize them as adequate improvements for that neighborhood?

A. Hardly as good as the neighborhood would warrant now.

Q. And take block 689, will you tell me where the improvements are in that neighborhood?

A. The gas company owns that entire block.

Q. And block 688?

A. The same is true of that.

Q. Are there any improvements on the block next to block 689, and if so what are they?

A. In which direction?

Q. East?

A. East, oh, yes.

Q. What are they?

A. The Tenth Avenue front, if I remember correctly, is built up with old tenements and some yards and further east there are better buildings, towards Ninth Avenue still, a good many yards and old tenements; the general character of the improvements there is poor, very poor.

Q. So that you cannot, as a matter of fact, mention a single new improvement in that whole neighborhood, can you, Mr. Wheelock?

A. Only the one that I have spoken of.

Q. And that is two blocks away?

A. Yes.

Q. Now, Tenth Avenue, south of Fourteenth Street, what is the character of the buildings there?

A. South of Fourteenth Street the Astor ownerships and various estate ownerships have created a better class of buildings, especially a little farther to the east, where large factory buildings have 5641 been put up on long leases to responsible tenants and the character of the improvements is better, stronger.

Q. There is a cold storage plant?

A. Yes, a good many——

Q. And an ice plant?

A. Yes, there are a good many such plants in that neighborhood. There were wine merchants and cold storage plants and biscuit factories and various things.

Q. And the Gansevoort Market is there?

A. Yes. It is hardly an adequate improvement, though.

Q. But as a matter of fact, all that property south of Sixteenth Stdeet is more valuable than the property you have been speaking of just above Sixteenth Street or between Sixteenth and Twentieth Streets because of those improvements?

A. It is a little better improved, yes; the estates up there have improved their property.

Q. So as the result of your computation with regard to these four plots you make a difference in your total valuation of $1,392,500?

A. That is right.

Mr. Mathewson: No, not those four plots; those four plots plus those other two plots taken, and the bulkheads, the whole thing.

The Witness: Yes.

Q. What was it you said with regard to the Dugro transfer that Mr. Thompson had spoken of in his testimony? You said you could not find any record of it?

A. I said I could not in my place, and I did not make a very diligent search, but the transfer companies where I went had no record of it. I do not doubt such a transfer exists, but I could not find it.

Q. I think you said yesterday that you had spoken with Judge Dugro's real estate representative and that he knew nothing at all about it?

5642 A. No, I said I had spoken with the people who usually carried through his sales, and I meant by those the title companies.

Q. What title company?

A. I spoke with the Lawyers' Title and Title Guarantee & Trust Company. Mr. J. Ray Cleveland, of the Title Guarantee & Trust Company, knows a good deal of his real estate business but not all necessarily.

Q. As a matter of fact, is not that title company searching the title now for Judge Dugro for that particular piece?

A. Not that I could find, Mr. Burr.

Q. Did you read Mr. Thompson's testimony with regard to that particular part?

A. Yes, I did.

Q. Do you recall that he stated the title did not go through at that time, though the price had been agreed upon because there was a squatter upon the property?

A. I remember the fact now that he said there was a squatter there.

Q. Don't you recall the fact that Mr. Thompson had the original contract with him here?

A. No, I do not. I do not doubt that it is so, I do not doubt that the sale went through, all I say is that I did not find a record of it, although I have not used every means of finding out.

Q. You have no idea of impugning the statement made by Mr. Thompson?

A. Not at all.

Mr. Mathewson: There is no such idea.

The Master: That is sufficiently clear; it has been stated three or four times.

Q. Have you got the records of the Dock Department showing the lease of that bulkhead property which you refer to?

A. I have the Dock Department's publications in my office.

Q. That is the 187 feet between 109th and 110th Streets, that I have reference to.

5643 A. Yes. By the way, Mr. Burr, can I correct the error that was made?

Q. Yes, when I come to it. I am informed by Messrs. Thompson and McHale that they do not find any such record in the Dock Department book.

A. I think I can show it to them. I have no record of the page. Mine is a book about that thick (indicating).

Mr. Mathewson: That is about four inches thick?

The Witness: Yes.

Q. Do you know whether the land under water went with that bulkhead?

A. It must have.

Q. And some upland?

A. Not that the record shows.

Q. Will you get that book?

A. Yes, I can produce it.

Q. Now, then, you may correct those dimensions, the transfer to Mr. Ogden, I think it was.

A. Yes. I said the bulkhead was 80 feet 8 inches long. I was in error in copying it; it was 50 feet 8 inches. The consideration was $45,600. I verified that by an inspection of the certified copy of the award.

Q. You say that if Twelfth Avenue was in existence you would allow sixty per cent. for a corner lot over an inside lot?

A. I would at Forty-second Street and also at Forty-fourth, Forty-fifth and Forty-sixth Streets.

Q. Why?

A. Simply a matter of judgment.

Q. Upon what do you base your judgment?

A. Why, exactly the same reason as I have given before in the testimony. I would in different parts of the city add various amounts to the inside lot value, of lots on the corner, all the way from forty to one hundred per cent.

Q. Doesn't that allowance go as low as twenty-five per cent.? 5644

A. I cannot recall any place where we put it at twenty-five, but I do recall forty.

Q. Well, outside of your own experience, do you recall where it has been done, where it is as low as twenty-five?

A. I don't know how others have made up their figures, but I don't remember instances at twenty-five per cent.

Q. You have not paid any attention to how others arrived at their figures?

A. Well, I have not asked other appraisers how they arrived at their figures.

Q. In what section of the city do you allow forty per cent. for corners?

A. Well, the sections where there is very little building, say for instance, in the west and south of Dyckman Street would be a case where there is very little building, where the advantage of a corner are comparatively slight, and because there are on that hilltop no buildings also—it is rather hard to pick a section offhand, but there are various sections of the city where the advantages of the corner are less than other places, and, in my view, forty per cent.

Q. Haven't you in mind any section built up where you allowed forty per cent.?

A. No, I don't think I have.

Q. Will you give me an illustration of any sale or place that you allowed forty per cent.?

A. I don't think I can. I simply have done so. I don't remember all the appraisals I have made, but I remember figuring as low as that at various times, but I cannot give you an instance. We make from thirty to fifty appraisals a day.

Q. Do you know how Batterson & Eisele bought their property at Shadyside for the marble yard, whether there were any buildings on that property?

A. I don't know, I don't think there were any at all.

Q. But you don't know anything about it, do you?

A. No. I wasn't there at the time and you cannot see what may have been there before, but I should think there were no buildings, from the character of the land. It does not look as though there had ever been a foundation put on it. 5645

Q. Now, you say, in your opinion, that if the Gas Company was excluded from Twelfth Avenue and Forty-second and Forty-third Streets that they could not obtain contiguous property of the same extent at less value than those placed by you on that property which they now have.

A. That is my opinion, based on actual work.

Q. Have you made any attempts to secure property in that neighborhood?

A. I have made attempts in various neighborhoods for corporations. I bought 12,000,000 for the Pennsylvania Railroad.

Q. I am speaking of this particular contiguous neighborhood that you have reference to?

A. I think I have, yes, for the Gas Company.

Q. Where and when?

A. It is over at that place, or in Sixty-sixth Street. No, it is not in that section, Forty-fourth and Forty-sixth Streets.

Q. So that your statement, in response to the question by Mr. Mathewson, that the company could not obtain property contiguous to the property that you valued at the figures that you placed upon their properties, was merely a guess, wasn't it?

A. No. We have various small plots for sale all through the city, and there are some even adjoining or close to this plant, if I remember correctly, but we have no large plots for sale and they could not be acquired. It is my belief that they could not be at the same price.

Q. There is no property there for sale at all, is there?

A. I think we have four or five small plots in that section for sale. We sold some in that vicinity.

5646 Q. When you say a "section" what territory does that embrace?

A. Within a block and a half one way or the other, north and south.

Q. Could you give me an illustration of any lots that you have for sale there and what the price is?

A. No, I haven't any record of this. I simply remember in a general way the records of my office.

Q. Will you produce those records when you produce that book of the Dock Department?

A. Of property for sale?

Q. Yes.

A. I think I can; yes, sir.

Q. Now, take up the property, block 991, lot 126, Avenue D and Tompkins Street. You also ventured an opinion there that the company could not get property in that neighborhood at the prices you have placed upon block 991?

A. I would say the same in any section of the city.

Q. That is merely a general opinion. Do you base the opinion with regard to 991 upon any property you have tried to acquire?

A. I have no specific facts to bring forth in that section at all. This is merely based upon my experience throughout the city.

Q. What is the nearest piece of property that you have to block 991 for sale?

A. I can't tell you, I haven't my records here of my office.

Q. You have at your office?

A. I believe complete records, yes.

Q. Will you produce them?

Mr. Mathewson: I am not going to ask the witness to produce records. I do not think it is necessary or pertinent.

Mr. Burr: I hardly think it is, because he says he does not know anything about it.

The Master: He can do as he likes about that, you know. I shall not direct him to appear for further cross-examination unless very good cause is shown.

5647 Mr. BURR: I shall not ask him unless he is willing to complete his examination.

Q. Mr. Wheelock, yesterday you said, with regard to that piece of property at 114th Street and 3d Avenue, that it had some extra value because of its "'L" shape?

A. I think it has a little, yes.

Q. Upon what do you base that opinion?

A. The same as before. It is observation of what takes place in the city, what we can see being done with plots. With Ls generally there are advantages of light and additional space, and it is on two streets; advertisements, various things.

Q. Well, you must have something to base your statement upon. Do you know of any sale or any actual occurrence where there was an increased valuation placed upon an L-shaped piece of property, by reason of its connection with the corner?

A. By reason of its connection with the corner? Yes; I do remember the consideration given, but there is a very clear case in my mind where my cousin, Austin G. Fox, owned a lot next west to the northwest corner of Sixteenth Street and Broadway and it was bought by the Bank of the Metropolis; they paid a very large price for it.

Q. Was Mr. Austin G. Fox acting for you when he bought the Pennsylvania property, or were you acting for him when you bought the Pennsylvania property?

A. He had nothing to do with the Pennsylvania property.

Q. I understood you to say you had some experience in buying the properties in the neighborhood of the Pennsylvania improvements?

A. Yes, I bought two-thirds of all they bought.

Q. I understand Mr. Austin G. Fox was the one that bought it?

A. He had nothing to do with it.

Q. Now, this particular piece on 114th Street and Third Avenue, this L-shaped piece of property near Third Avenue, has no
5648 connection at all with the corner, has it?

A. I don't know what you mean by "connection." The two are adjacent and contiguous.

Q. It is 150 feet from the corner, I understood?

A. It is exactly 100 feet. It begins 100 feet westerly from the northwest corner of 114th Street and Third Avenue.

Q. Well, it is 100 feet from the corner?

A. Yes.

Mr. MATHEWSON: The corner lot is 100 feet deep?

The WITNESS: The corner lot is 100 feet deep.

Q. There are only 25 feet on Third Avenue, and then there are 150 feet 5 inches on 114th Street; is that right?

A. That is two dimensions of the plot. In fact, there is a little more on Third Avenue than that.

Q. Twenty-five feet 2¾ inches?

A. Yes, that's right.

Q. Then that L is 100 feet and 11 inches in depth?

A. Yes.

Q. But it has no connection with the property on Third Avenue other than the 25 feet 2¾ inches at the corner?

A. No, not that I could find out. The Consolidated Gas Company does not own any more there. I would like to say, Mr. Burr, that the value of a plot of that shape is actual not only to the people who own it but speculative for the uses that it may be sold for. It abuts four parcels on Third Avenue and may be used in connection with any one of the four, and that is always an element of speculative value which is taken into consideration in appraising property.

Q. In a tenement house neighborhood does extra depth count for anything?

A. As a rule very little unless it amounts to more than ten feet or so.

5649 Q. Isn't this a tenement house neighborhood?

A. Generally, yes.

Q. You say that 126 and 128 East Seventeenth Street was sold to the city for $40,000 and $50,000 respectively?

A. Yes.

Q. Where did you get that information?

A. The *City Record.*

Q. Have you had any experience in selling the City of New York property?

A. Yes.

Q. From that experience don't you know that the city always pays more than the value of property at private sale in order to save the expense of condemnation proceedings?

Mr. Mathewson: I object to that as irrelevant.

Question allowed; exception.

A. As a rule, that is so. Sometimes it is not. I had a number of plots for Carnegie libraries where they did not pay more.

Q. In reply to a question of Mr. Mathewson's you said Mr. Thompson stated on his examination that he did not know of the sale of 174 Hester Street?

A. I do not think I said that, I think it appears he did know the sale, but didn't know the consideration. If I remember it all right, it appears Mr. Thompson has a record of the sale, but not of the consideration.

Mr. Mathewson: Yes, that is precisely the question I put, and if the stenographer has it otherwise it is a stenographic error.

Mr. Burr: You were asked this question by Mr. Mathewson (page 5612): "I also asked Mr. Thompson, at page 2754 as to a sale at 174 Hester Street, between Mulberry and Mott, 25 by 100 feet, with old three-story buildings of no value, selling in 1905 at $26,500. No record was found by Mr. Thompson." As a matter of fact Mr. Thompson testified as regards that.

5650 Mr. Mathewson: My question was that there was no record of the price. The stenographer must have left it out, because I find it here in my notes as I asked the question.

Mr. Burr: You said it was three stories, when as a matter of fact, Mr. Thompson stated it was five stories.

Mr. Mathewson: That may be. My question was subject to any correction the witness wanted to make.

Q. I call your attention also to the question Mr. Mathewson asked regarding No. 606 East Fourteenth street, in which he stated that Mr. Thompson could obtain no record of the sale of the property, when, as a matter of fact, at page 2758 of Mr. Thompson's testimony, he testified fully with regard to the sale. Your information was incorrect that he didn't know anything about it?

A. It is not true he testified at that place to 606 East Fifteenth Street.

Mr. Burr: At page 2785 it is 606 East Fifteenth Street.

Mr. Mathewson: At pages 2760 and 2761 his testimony is as to 606 East Fourteenth Street, and the witness was correct and my question was correct.

Q. I want to call your attention to another mistake. You were asked, Mr. Wheelock, with regard to 455 West Sixteenth Street, and your attention was called to the fact, as stated by Mr. Mathewson, that Mr. Thompson knew nothing of the record of the sale?

Mr. Mathewson: No; no price. Now you are wrong again.

Mr. Burr: Could not give the consideration.

5651 A. That is right.

Q. It is 445 instead of 455, isn't it?

A. There must be a mistake.

Mr. Mathewson: I did not ask about 445 West Sixteenth Street and had no note of it at all during my examination.

Mr. Burr: I simply go into it so that the record may be straight.

Mr. Mathewson: Just make a note that the record should be corrected.

Q. Mr. Thompson stated that there was a nominal consideration in his testimony, isn't that so?

A. I think he did. That is, that was one of the sales where the source of my information was not admissable, I believe.

Mr. Mathewson: The Title Guarantee & Trust Company. That is excluded already, Mr. Master.

Q. You were asked by Mr. Mathewson whether you knew of the sale of Sixty-first Street, north side, 50 feet east of the railroad track, which, I understand him to claim, Mr. Thompson had testified he knew nothing about, when, as a matter of fact, Mr. Thompson only denied the fact that the lots sold for $8,100 each.

A. I think that is right.

Q. Is there any record of the consideration, to your knowledge?

A. There is a record of it which is satisfactory to me, but not to you, Mr. Burr.

Q. I do not understand that you dispute the correctness of the method pursued by Mr. Thompson and Mr. McHale with regard to the plottage, and so forth?

A. I have nothing to say about that whatever.

5652 Q. You in your own office and in your own experience pursued a different method?

A. That is all.

Q. But you do not question the correctness of their method?

A. I have not, and I do not wish to.

Q. Making this allowance of three per cent. for shortage, what rule did you follow—just a matter of judgment?

A. A matter of my own judgment, and some scales which we use in our office, which are made up by various people connected with our office, and taken from other lists outside.

Q. Does that conform to the Hoffman rule or the Neill rule?

A. I don't think the Hoffman rule goes into deductions for lots which are short. It gives a value of rear portions and front portions of lots in relation to the whole lot, but you can deduce a rule from that and that has been in use in our office, together with the Neill rule, also other rules that have no name.

Q. What is the difference between the Neill Rule and the Hoffman Rule?

A. Mr. Neill gives more value to the front of the lot in proportion to the rear.

Q. Is that the only difference?

A. The only difference that I remember specifically.

Cross-examination by Mr. Kirby:

Q. Assuming a gas company owns the entire block with the exception of the corner property and one of the same size in the middle of the block, would you consider that the corner property was of 40 per cent. more value to the company than the one in the middle of the block?

A. Assuming that the company owned all but the corner, do you say?

Q. All but the corner and a property of the same size in the middle of the block?

A. I do not think I catch your meaning.

5653 Q. We are assuming that a gas company owns the entire block with the exception of a property of, say, 100 x 50 feet on a corner, and another property of the same size in the middle of the block; do you consider that the corner property is worth 40 per cent. more to the gas company than the one in the middle of the block?

A. They do not own it. How can it be?

Q. Would it be worth it if they were purchasing it?

A. That depends. If it had no use for it in addition to its plant it probably would not pay more than that. If it could use it and add it to its plant it would pay anything up to 100 per cent. to get it.

Q. Would it not pay anything up to 100 per cent. to get property in the middle of the block?

A. Possibly considerations governing the purchase might govern the price unduly.

Q. Can you see any reason why it should pay more for the corner property, other things being equal, than it would for the other property?

A. Certainly; advantages of light and air and the future.

Q. For the purposes of future business do you think it would pay more?

A. If you mean to put a gas holder on it I doubt if it would.

Q. You have given us to-day certain unit values which you use in getting the total of your appraisals on this property which has been taken by the city. Do those unit values differ from those which you use in making your appraisal of the entire property, including that which has been taken by the city and of which you have already testified?

A. The street units are the same; Tenth Avenue units are the same. I had to establish a marginal street unit because when I testified before there was no marginal street, and the land was interior property.

5654 Q. And are those marginal street units higher or lower than those of the street units which you use in the other parcel?

A. They are higher than the street units naturally.

Q. And why?

A. Simply because they face a water front, a very wide street with large dock improvements.

Q. Are these improvements there at this time?

A. Some.

Q. What?

A. Docks.

Q. Where are these docks?

A. From Fifteenth Street north.

Q. Are they being used?

A. Some are, some are not; they are not leased yet.

Q. Wherein do these unit values which you have given differ from those on streets facing the water front northward of this property? Are they higher or lower?

A. My values north of the gas property to Twenty-first Street would be considerably higher.

Q. Would these values which you have given for this property be higher or lower than those immediately to the north?

A. Immediately to the north there would be a gradually increasing scale as you go north.

Q. And to the south?

A. Equally. It would increase a little more rapidly two blocks to the south.

Q. Are these values higher or lower than those of the avenue value which you used in your previous appraisal?

A. If I remember correctly, they are within $1,000 of the Tenth Avenue value.

Q. $1,000 which way?

A. Increased value to Tenth Avenue.

Q. Have you based these values upon the expected rental values of these docks which are not as yet being used?

A. I have already given my basis of value all the way through.

Q. With the exception of this marginal street have you noted any different conditions in coming to your present unit values 5655 than those which were in existence at the time you based your appraisal of the entire property?

A. No, I have not changed them in any particular.

Redirect examination by Mr. Mathewson:

Q. In your estimate of values of Eighteenth Street, I assume you took into account all these improvements in character of buildings and the tendencies to which you have testified?

A. Yes, sir, and also what I hear is going on and not yet bought up.

Q. And in all your estimates you took into account your general information and knowledge?

A. Yes.

By Mr. Burr:

Q. You are testifying then with regard to something you have not specified here, with regard to what you hear is going on or proposed to go on?

A. Oh, yes, gossip in the neighborhood always affects our judgment, general opinion.

Q. Then your valuation is based upon gossip, is it?

A. Partly.

The Master: Oh, Mr. Burr, do not waste time.

Mr. Burr: I won't waste any time after that answer.

Mr. Mathewson: I may say at this point that I shall not ask the witness to bring any records from his office. I do not consider it pertinent or necessary in the absence of instructions from the Master. As to the Dock Book to which reference was made, I will ask him to send it to me and show it to you, Mr. Burr.

Mr. Burr: You may accentuate or minimize your testimony in your own fashion.

5656 Datus F. Brown, a witness called in rebuttal on behalf of complainants, being first duly sworn, testifies as follows:

Direct examination by Mr. Mathewson:

Q. Where do you reside?

A. Albany, N. Y.

Q. Are you connected with any concern dealing in gas stoves?

A. Yes, sir, Rathbone, Sard & Company.

Q. Where is their business?

A. Albany, New York, and Aurora, Illinois.

Q. Have they dealings outside the State of New York?

A. Yes, sir.

Q. In gas stoves?

A. Yes, sir.

Q. Over the country generally?

A. Throughout the world.

Q. Are they makers of gas stoves and appliances?
A. Yes, sir.
Q. What is your position?
A. Manager of the Gas Stove Department of the business.
Q. Do you know whether your company has made tests from time to time as to the minimum point of complete efficiency of their gas stoves?
A. Yes, sir, we have.
Q. During years past?
A. We always find it necessary to do that.
Q. And have they made these tests in reference to the actual cooking and baking and use of the apparatus practically?
A. Yes, sir.
Q. What pressure at the apparatus do you find as the result of these tests is required for the efficient operation of your apparatus?

Mr. Burr: Objected to as incompetent, immaterial and irrelevant.
Question allowed. Exception.

5657 A. About 20-10 to 35-10; what is known as 2 to 3½ inches.
Q. Do you notice a loss of efficiency when you get below 20-10?
A. Yes, sir.
Q. And if you get to 15-10 what sort of a flame do you notice, as to being weak or wabbly or strong, or otherwise?
A. It is a very weak flame.

Mr. Burr: If this witness is called in rebuttal, I would like to know what the object of these questions is; what is the particular point this witness is called to rebut?

Mr. Mathewson: I think it was shown before when a previous witness was on the stand. We presented a proposition that we could not maintain the pressure between an inch and *and* 2½ inches, and if we could we couldn't give service to the consumers. Mr. Edgerton comes in and testifies that one inch pressure is sufficient for the operation of gas apparatus and apparatus generally. We are rebutting that by practical men.

The Master: Proceed.

Mr. Mathewson: That is all.

Cross-examination by Mr. Kirby:

Q. What is the name of the stove that you manufacture?
A. "Acorn."
Q. Are they on sale in the City of New York?
A. No, sir.
Q. Do you know how many are in use in the City of New York?
A. We have not a large number in use. We have not been fortunate in getting into this market.
Q. What kind of burners do you use?
A. Ordinary type burner—star-drilled top, with a drilled oven burner.
5658 Q. Which is an adaptation of the Bunsen burner, is it not?

A. Yes, sir; blue flame burner.

Q. Where did you make these tests of which you speak as to the pressure required?

A. Albany, New York.

Q. What kind of gas?

A. It is what is known as a coal and water gas; it is the coal gas enriched for candle power with oil.

Q. What is the candle power?

A. Our candle power up there runs about 20 or 22, I don't remember just what.

Q. Did you ever measure it?

A. No, sir. I have been at the works, however, and Mr. Dunn told me what the candle power was.

Q. But you don't know?

A. I couldn't testify, no, sir.

Q. At the time you made these pressure tests did you at the same time make tests of candle power?

A. No, sir.

Q. You don't know whether the candle power varied while the pressure test was being made, do you?

A. It may have. Not likely.

Q. How did you make your test for pressure, with what apparatus?

A. The ordinary pressure *guage*.

Q. What do you call the ordinary pressure *guage*?

A. The pressure tube—trap—weighted.

Q. Would you call such an instrument one that would register within one-tenth of 1 per cent?

A. That would be as close as we figure, I am sure.

Q. Would you figure as close as that?

A. No, I don't think so.

Q. How close would you figure?

A. Well, I can't say as for that. We use the ordinary pressure *guage*. I am not a scientific man; I am simply practical.

Q. What is the name of the apparatus?

A. I couldn't say. We use various pressure *guages* such as are on the market.

5659 Q. Did you make these tests yourself?

A. Yes, sir.

Q. Have you a record of the result thereof?

A. They are usually kept.

Q. Have you those records?

A. No, sir.

Q. You are speaking then just from memory?

A. I am speaking from memory.

Q. When were the last ones you made?

A. At the time our salesmen were in. I think it was about January 3d of this year.

Q. What was the test that you used and upon which you based your conclusion that the most efficient pressure is from 20/10 to 35/10?

A. It was with reference to the efficiency of burners.

Q. How did you make it?

A. We had a case where a gentleman claimed that our burner was not efficient, and his test was bringing to a boiling point ten pounds of water. Our burners, at the ordinary pressure, would consume——

Q. What do you mean by ordinary pressure?

A. Well, say 20/10. We consume about ten and one-half feet per hour. In order to bring the given quantity of water to boiling temperature we found we had to use a large amount of gas per hour and that by using a burner, for instance, that would consume fourteen feet per hour, or putting pressure back of the gas that would enable us to use that in our burner, we could raise this quantity of water to the boiling temperature with less gas than where we use it under low pressure or less gas pressure. The matter came up with reference to a test we had at Pen Yan, New York.

Q. Did you also make experiments as to how close to the flame the receptacle containing the water should be placed for the higher efficiency?

A. Yes, sir.

Q. And does that make any difference?

A. Yes, sir.

5660 Q. Does that make any difference with different pressures?

A. Yes, sir.

Q. What point did you use in your various tests of pressures?

A. We tried to establish, as near as possible, the centre of what we call the purple light.

Q. Did you keep any record of the various distances from the flame or the receptacle in the different experiments which you conducted?

A. Yes, sir.

Q. Do you remember those?

A. We tried from 1¼ inch, 1⅜ inch, 1½ inch. We found with our pressure 20/10, that we were keeping up in our experiments, that about 1⅜ inch with 20/10 pressure was the proper distance.

Q. Now, did you endeavor also to adjust the gas burner of the range so as to give the highest efficiency?

A. Yes, sir.

Q. And this also makes a difference, does it not?

A. Certainly.

Q. And with a high pressure the gas could be adjusted in its flow so that you would have a high efficiency, would it not?

A. Yes, sir.

Q. Where did you attach your apparatus to make the reading of pressure?

A. It was just before the gas entered the range.

Q. What point is that?

A. Just where the gas entered the supply pipe at the back of the range.

Q. On which side of the cock turning on the gas?

A. On the supply pipe side.

Q. Was the cock turned during the taking of these experiments?

A. I hardly understand you.

Q. Was the cock upon the gas range turned during the making of these experiments?

A. Only if you turned it off and on.

Q. Did you take any experiments with the pressure below 20/10?

A. Yes, sir.

Q. What is the pressure of gas as furnished to the burner in Albany?

5661 Mr. Mathewson: He stated as near as he knew, didn't he?

Mr. Kirby: No.

Q. Do you know?

A. From about fifteen tenths to thirty-five tenths.

Q. How did you get a constant pressure for your tests?

A. We have a little separate tank weighted down to give us the proper test.

Q. And it was from this tank that you took the gas to make your experiments?

A. Yes, sir. We used it for testing both high and low pressure, both natural and artificial.

Q. Do I understand you in saying there is no difference in efficiency between twenty tenths and thirty-five tenths?

A. The location of the cooking vessel would have something to do with that, sir, according to what you wished to accomplish. There are various things to be accomplished in a gas range, the cooking of the top burners, the use of the oven, the broiler, toasting, roasting; we find for accomplishing all these things our minimum pressure would not be less than twenty tenths because cutting down your burner with a valve and lessening the orifice, if you attempt to turn down your burner you do not get good results. If your burner is highest it is wide open, which would be a waste of gas We might perhaps cut that pressure a little, very little, and get a good result. An average of twenty-five tenths I consider the best possible result.

Q. That is, the range could be left without adjustment of any kind and produce the best average result at that rate?

A. Yes, sir.

Q. Are you familiar with the operation of gas ranges and heating apparatus in Great Britain?

A. No, sir.

5662 Cross-examination by Mr. Burr:

Q. You have had no experience in operating gas plants, hav you?

A. No, sir

Q. Does the candle power of the gas affect the stove at all?

A. Not as much as pressure.

Q. How much does the candle power of the gas affect it, if at all?

A. I could not speak as to percentage of efficiency.

Q. But you would say that in addition to the pressure the candl power of the gas would enter into the efficiency of the stove or th amount of efficiency in the stove in some degree?

A. Yes, it will, certainly, but not to as great a degree as the pressure. I simply said this because I test in different parts of the country. We have a factory at Aurora, and I test on gas over there and I test in the gas at Albany and various places where I go, to see about the efficiency of our stoves, and I have found this, that we get better results where high pressure is maintained and less with reference to the candle power of the gas.

Q. The size for instance of the supply pipe has something to do with the stove?

A. Well, you are enabled to main- a better and more even pressure which is necessary if you use a supply pipe.

Q. If you had a larger supply pipe you would be able probably to do with 15/10 pressure, and with a smaller one would you require 20/10 pressure?

A. No, sir.

Q. Why not?

A. Because you cannot use gas in ordinary appliances under 15/10 pressure and get as good results as you will above that. You cannot gain in pressure by putting it in a large pipe.

Q. Is it not a fact that the price of gas has been reduced in Albany recently?

A. I don't know, sir.

By Mr. Kirby:

5663 Q. I take it where you do not intend to increase the size of the supply, it is an advantage in that it maintains a more even pressure than would otherwise be maintained?

A. That is all.

Q. And to maintain an even pressure is a great advantage in the efficiency of a gas stove?

A. With a good sized supply pipe, no question about that.

Q. And in these experiments which you have made around the country, you generally found the gas supply was about an inch pressure, didn't you?

A. The average is about 18/10.

Q. That is measured at the stove?

A. Yes, sir; in the manner we ordinarily measure.

By Mr. Mathewson:

Q. Your test for pressure with the ordinary "U" tube?

A. Yes, sir.

Q. Where the water stands in the tube and the difference between the height of the water on one side of the tube and the other represents the pressure?

A. Yes, sir.

Mr. Burr: That is objected to as leading. Why not let him tell the method he pursued in making this test.

Mr. Mathewson: You asked him, and I asked him if he used the ordinary "U" tube of a certain character.

Q. When you speak of gas being adjusted at the range in the case of these tests, do you mean it was adjusted as between the amount of gas and air required to render the efficient burning?

A. I don't remember answering that.

Q. You said the gas was adjusted at the range in each case of your tests, as I recall your statement, before your test or at the time of the test. When you say gas adjusted do you mean gas adjusted as between the apparatus and gas and air to get the best burning efficiency?

A. Yes, sir.

5664 **John M. Brock**, called as a witness on behalf of the complainant, in rebuttal, being duly sworn, testified as follows:

Direct examination by Mr. **Mathewson**:

Q. Where do you reside?

A. 204 Percy Street, Flushing, Long Island.

Q. Are you connected with any concern that handles gas ranges?

A. Yes, William M. Crane Co.

Q. Where are they?

A. Their office and store rooms are at 1131 Broadway.

Q. New York?

A. Yes, and their place of manufacture at Peekskill.

Q. Are you head of the sales department of that company?

A. That is my position, sales manager.

Q. How long have you been there?

A. With the Crane Company?

Q. Yes.

A. Three years and three months I would say, to be accurate.

Q. How long an experience have you had in this business?

A. Between eight and nine years.

Mr. **Kirby**: You mean the gas range business?

The **Witness**: Yes, and the handling of gas appliances.

Q. In connection with the gas stove business, has your company and have you made experiments and tests as to the pressure under which your stoves operate efficiently, the minimum pressure?

A. We are making experiments at all times, especially at this season of the year, when we are producing and introducing new goods.

Q. Do you make your experiments with New York City gas?

A. We make experiments with both Peekskill and New York City gas; my experiments are made with New York City gas.

5665 Q. Will you state what the result of your experiment is with New York City gas as to the minimum pressure required for efficient operation of the gas range?

A. I find that when I get below a pressure—I might in explanation say that I take my pressure at two points, at the street side of the meter, or at the point where the service enters a building, before it enters the meter; the pressure there that I find works at the best advantage at that point is 25 to 30 tenths, at the gas appliance, taking my pressure at that point where, supposing we are testing before the gas enters the upper manifold, before it enters the range at all, I either put a T in or a U g*ua*ge or Thorpe g*ua*ge, or take my pressure at the top manifold, and there I prefer and find that I have the best results by working under a pressure at that point of 18 to 22 tenths.

Q. 18 to 20 would be the minimum?

A. I would say yes.

Q. Have you made any tests in reference to baking and cooking, as well as tests as to the best pressure in raising water to a required temperature?

A. In raising water I find a better advantage is had by increasing the pressure, if possible, about 5 tenths, I would say; I find it is necessary in heating water in the appliances that we manufacture, and such as I have tested, to increase that 5 tenths, but, of course, we operate under a less pressure.

Q. And that refers to water heaters?

A. Yes.

Q. But taking the use of the gas range for cooking, what results do your tests disclose as to the efficiency in actual use of the ovens or stoves for cooking and baking, as to pressure?

A. The tests we make most, of course, are baking tests, or as we call them, biscuit tests. I find if I operate with a pressure of less than 18 tenths, say 15 or 12 tenths, I will speak of 12 because that is a test I made recently. In making my biscuit test the finished
article, after baking a considerably greater length of time,
5666 and a greater consumption of gas, the finished article is not
at all inviting in appearance; the top of the biscuit instead of being flat, as we desire it, is raised in the center and droops off to the edges; there is a crust formed entirely over the biscuit, which has the effect of cutting the roof of your mouth; I don't know of any better way to say it. Then when we break our biscuit open the interior of the biscuit, instead of being flaky, as we like to have it, is hard and unpalatable.

Mr. Kirby: What pressure biscuit is this?

The Witness: About 12 tenths.

Q. So you would not consider that in your experience an efficient pressure to cook biscuits, at any rate?

A. I would hate to have our stoves g*ua*ged by that product.

Q. Without going through the details as to the cooking of meat, do you find similar results when you get below 18 and to 20 tenths?

A. My experience with steak is that it is steamed out, and white on the top if baked with a slow heat, and we cannot get that rich gravy that is produced when meat is roasted at a proper heat.

Q. In other words, you cannot cook it properly?

A. No, I cannot.

Q. Have you had any experience as to the point of flashing back?

A. Where my pressure is very low the burner is more apt to snap back. If I open my air port to get a perfect flame the burner is very apt to snap back at the first lighting.

Q. What is your experience as to Welsbachs?

A. When you ask me that, my experience with lighting has not been as much.

Q. You have not had as much experience as you would like, to testify?

A. I have not had much.

5667 Q. Then I will not ask you as to Welsbachs. Is your concern willing to guarantee efficient operation of the stove that they install with a pressure of less than twenty tenths?

Mr. **Kirby**: I object to that.

Mr. **Burr**: Objected to as incompetent, irrelevant and immaterial.

The **Master**: I will allow it.

Mr. **Burr**: Exception.

Mr. **Kirby**: Exception.

A. I would not want to put out a stove and promise any kind of results at all and guarantee them with pressure less than sixteen tenths; I would sooner put it that way.

Q. And at sixteen tenths you would not consider the results as good as at twenty?

A. Not by any means.

Q. You mean as to the results obtained by the stove and consumption of gas both, so far as concerns the consumer?

A. I could not do my work as efficiently or economically with gas pressure below that.

Q. You mean by that the consumer could not?

A. No.

Cross-examination by Mr. **Kirby**:

Q. Your tests have not been directed toward the heat units developed by the gas burned so much as toward the kind and character of cooking which the gas would do, are they?

A. We never make our tests so definite as to take in actual heat units; our tests are made by boiling tests, boiling a pound of water to see how much gas is required and how much time is required.

Q. In making a tests which has to do with boiling a certain quantity of water, there is a great deal of heat which does not go to heat the water, is there not?

5668 A. Well, there is a certain loss of heat at the side of the cooking utensil, and there must be; and I think the way we construct our burners to-day we overcome that a great deal, especially the burner we make, that is one of our advertising claims.

Q. And you have never made any tests which would take into account those lost heat units as well as those which are used in heating the water?

A. I would not know how to make an appliance to make such a test; I have never seen one.

Q. That would be a scientific test beyond your experience?

A. I think it would be a scientific discovery.

Q. But such tests are made and the heat units lost are so small that they can be allowed for by proper proportioning, can they not?

A. Not in any tests I have made.

Q. In taking your pressures you have stated the two points where you took your pressure?

A. Yes.

Q. One between the meter and the service main?

A. Yes.

Q. And one between the bracket to which I take it the hose or pipe of the gas range——

A. No—the iron pipe.

Q. And the iron pipe and the stopcock to turn the gas into your range?

A. At the side of the range is what we call an open manifold, it is practically the end of the pipe system on the range, and that is joined to the gas supply with a union, that is the point I sometimes put my test.

Q. And that point is on the side of the cock away from the range?

A. Before the gas enters the range.

Q. Have you ever made any tests between that stopcock and the point of ignition in the range?

A. I don't think I have; I don't think I have ever tapped into a burner proper. I tap between those points at the oven manifold.

5669 Q. Now, differences of construction in ranges would produce different results, would they not, as far as the pressure which would be required for highest efficiency is concerned?

A. There might be, I would hardly think it would be so it would be of any importance, though.

Q. If the oven of a range were so constructed that it would not contain the heat, you would have to look to the flame wrapping around it, as it would around a receptacle in which water was being heated, you would look for a higher pressure for greater efficiency, wouldn't you?

A. As ovens are constructed to-day, with the two styles, the flues or direct heat, I think it would have no bearing. The heat is carried through a series of flues or directly into the oven.

Q. The effort by you is to use all the heat possible?

A. Well, without preventing perfect combustion, and smothering of your flame.

Q. What is the name of the stove you manufacture?

A. We manufacture the "Vulcan" line of appliances, and also sell the "Perfect" line of appliances.

Q. What kind of a burner does the Vulcan stove use?

A. We use a circular burner drilled open at the center with the flame produced directly from the center, a pipe burner drilled.

Q. Is that an adaptation of the Bunsen burner?

A. It is the regular blue flame burner which all ranges use, I believe.

Q. And do you use a needle valve on your ranges?

A. No, a fixed orifice.

Q. And you use a stopcock valve?

A. We would have to use some means to stop the gas off, certainly.

Q. But it is not a needle valve?

A. No.

5670 By Mr. **Burr**:

Q. Does the size of the orifice affect pressure?

A. We regulate the orifices to meet the pressures at different points.

Q. At what different points?

A. Some different towns operate under different pressures.

Q. Do you find a difference in the quality of the gas in the different towns?

A. I think there is a difference in the quality of gas. There is some variation in candle power.

Q. Do you adapt your stove to the quality of the gas?

A. We take into consideration pressure, which seems to be the only thing to be considered.

Q. The quality of the gas does not affect the stove at all, does it?

A. We do not build stoves taking that into consideration, because I do not see any need of it.

Q. You have been building stoves for three years?

A. I never built any stoves at all myself. I have sold a great many of them and handled a great many.

Q. Do you sell any to the Consolidated Gas Company?

A. Quite a number.

Q. Are you acquainted with Mr. Brown, the gentleman just on the stand here?

A. I know him, yes.

Q. Does he sell stoves to the Consolidated Gas Company?

A. I believe his testimony answered that.

Mr. MATHEWSON: I do not think he testified to that.

Mr. KIRBY: He said he wanted to, but had not.

Mr. MATHEWSON: Yes, I think that is something like it.

5671 Re-direct examination by Mr. MATHEWSON:

Q. Are not these stoves which your concern is selling, and which you have described, and which Mr. Brown sells, the ordinary gas stoves such as are generally used, gas ranges?

A. They compare with any that I know of, there is only one that I know that is radically different.

Q. They are common and usual patterns?

A. Yes.

Q. Has your concern a large bus-ness over the country?

A. As manufacturers of gas appliances generally, taking in the variation of lines, I think we are the largest in the country.

Q. As to the quality of gas affecting results, is it not the fact that the amount of air which you introduce, or allow to be introduced with the gas, is adjusted in accordance with the quality of the gas so as to get a proper mixture?

A. Yes.

Q. And that would take care of itself in that way?

A. Yes, and it is adjusted through our efforts.

Q. In reference to the pressure regarding which you testified in reply to my question, I referred, of course, to the pressure at the apparatus. I supposed that is what you referred to?

A. Yes. I spoke about two, one at the apparatus and one at the street.

Q. But in your testimony you always referred to the pressure at the apparatus?

A. Yes.

Q. Is it not the fact that in the experience of the company in New York, it is not infrequently necessary to take out stoves because you cannot get pressure enough or they will not operate efficiently?

A. We lose a great many orders in our retail department because we cannot use the appliance at all. Take gas heaters, and logs, and grates, because we cannot get sufficient pressure.

5672 Q. In the City of New York?

A. In the City of New York.

Q. Do you find any disquisition as to the number of heat units which are being produced is of much value in a case where the housewife cannot cook her biscuits with the pressure she gets?

A. In fact, that question of heat units, and I claim to be a practical gas man, is so far foreign to me that I do not want to testify anything about it.

Q. What you testify is as to actual results?

A. As to actual results.

Re-cross-examination by Mr. Kirby:

Q. Mr. Mathewson has opened up a new field in regard to gas ranges. Do you take it that the reason for the inability to use gas ranges and logs efficiently is due to too small housepiping?

A. We find that sometimes, we find that we cannot get the supply owing to the pipe being too small, but if we had a little better pressure we could get it through that particular pipe.

Q. And you could get it through a very small pipe if you had enough pressure?

A. I don't know how far we could, but I think we could work down as far as one-half or three-eights.

Q. You would need four, five or six inch pressure for that?

A. No, I think thirty tenth, or three inch pressure would give us what we wanted.

Q. That would not be so if you had a good many apparatuses for this small pipe you speak of?

A. I do not think our plumbers would pipe houses to the extreme you are mentioning.

Q. You have never made any tests as to the calorific power of gas of different candle powers, have you?

A. No.

5673 By Mr. Mathewson:

Q. Is it not a fact that complaints have been very numerous lately as to pressure in the operation of gas stoves?

A. We had a district in Harlem, I am not prepared to say exactly, but it was within the last four or five months, we simply had to refuse to take any more orders there. We could not help them out, and it was due to lack of pressure, and we had to turn down every order; and in a number of cases I know the gas stoves have been taken out and coal stoves put in.

By Mr. **Kirby**:

Q. And Harlem is a district which has been built up comparatively recently, and the houses are fairly new on the average?

A. And proper size piping.

Q. What do you mean by proper size pipe?

A. We have a scale figured out; I am not prepared to say exactly what that scale is, but it is figured from a series of tests. When we start on a line of 100 feet, I will say 100 feet, but I do not intend this to be exact—we would say we have to use an inch pipe. If we start with 150 feet we would have to increase it to one and one-quarter inches; and that is taken into consideration when the house is piped.

Q. And that is taking into consideration a pressure at the meter of how much?

A. I think that is based on about twenty-five tenths; I would not want to say that that is positive.

Q. So if the house were piped properly in accordance with your scale there would be no troubles such as those you speak of?

A. And proper consideration given to the number of appliances which were going to be taken off that line.

By Mr. **Burr**:

Q. Do you say that Harlem has been recently built up?

5674 A. I think there has been a great deal of building recently; my experience in New York only dates back three years.

By Mr. **Mathewson**:

Q. Of course, the house piping is regulated by the city authorities?

A. I think so.

Q. And we have no control over that?

A. No.

By Mr. **Kirby**:

Q. But the city has no control over the size of the pipe, has it?

Mr. **Mathewson**: That is it, they specifically require it.

The **Witness**: I think they require what size of pipe must be used.

Q. It cannot be less than so much?

A. No.

By Mr. **Burr**:

Q. The trouble in the apparatus in Harlem has only been in the last four or five months?

A. No, I wouldn't say that. I say we had a series of trouble which started about four or five months ago. I think we are having some complaints still about that.

Q. But you had no complaints before that?

A. I am speaking of this particular time four months ago. I do not care to go beyond that. I know it was brought to my attention particularly:

By Mr. **Mathewson**:

Q. Is it not a fact that since the new pressure law went into effect on July 1st, 1905, you have had great numbers of complaints?

Mr. **Burr**: Objected to as leading; all this is leading.

The **Master**: It is rather leading.

5675 **John W. M'Clellan**, called as a witness in behalf of the complainant, in rebuttal, being duly sworn, testified as follows:

Direct examination by Mr. **Mathewson**:

Q. Where do you reside?
A. 909 Seventh Avenue.
Q. City of New York?
A. Yes.
Q. Are you connected with any company manufacturing or distributing gas appliances?
A. Yes, sir.
Q. What company?
A. Manhattan Gas Heating Company.
Q. What is your position there?
A. General Manager.
Q. Do they manufacture gas grates?
A. We manufacture grates, fireplace grates.
Q. Logs, as they are called?
A. Yes, we might say—they are manufactured under a contract, but they are meanufactured from our design, and from our constructions.
Q. Do you sell grates to the general public?
A. Yes.
Q. To the consumer at retail?
A. Yes.
Q. You do not find that the gas companies are purchasers of grates in large numbers?
A. Very few in late years.
Q. How about water heater apparatus, do you sell that?
A. We sell only a water heater made by the Michigan Stove Company.
Q. Has your company made tests as to the minimum pressure at which full efficiency can be obtained by your apparatus?
A. On gas g-ates and logs.
Q. What is the minimum for efficiency there without flashing back?
A. We do not care to put in a gas grate or gas log under a twenty tenths pressure.

5676 Q. Do you find a higher pressure than that better?
A. Yes.
Q. Are you able to state as to water heaters; is your experience sufficient so you can say what minimum you would consider?
A. Only in a way that if we are putting on water heaters, if we

do not get a twenty tenths pressure; we certainly would not put them on and guarantee them.

Q. You refer to conditions in New York City?

A. Yes, sir, in New York City, Manhattan.

Q. And before you install such apparatus does your company make an examination to ascertain the pressure that may be expected?

A. If we suspect there is—you can tell ordinarily what the pressure is or we can tell, we are so accustomed to putting in grates and logs, we can tell by opening the cock; if we suspect there is a low pressure we put a test gauge on, and if the pressure runs under twenty or eighteen or twenty tenths, we would just as soon not put them in.

Q. You will not guarantee them under twenty?

A. No. We get more trouble from the apparatus if we put it under a low pressure. We would rather lose a sale and not bother with it. It gives us more trouble.

Cross-examination by Mr. Kirby:

Q. Do you make these tests of which you speak?

A. I personally make quite a good many of them, yes, sir.

Q. Where have you made them?

A. Are you speaking now of testing our own apparatus?

Q. Yes.

A. At our place of business, 909 Seventh Avenue.

Q. And how do you test them?

A. We have an apparatus down stairs where we test, and we test with an ordinary U-*gua*ge, I think it is one of Gleason's
5677 make; it runs up to 4½, 4½ I think is the maximum water test.

Q. At what point do you test the pressure?

A. Do you mean at what point do we test our heater?

Q. Yes.

A. Well, our object, of course, is to get a heater or burner that will run as low an amount of gas as we can and give a good result, and we have been obliged in the last two years to make our burner smaller. We make a face burner, or an asbestos burner, the regular size we used to run 17½ here and 23 inches high. Under the low pressure we find we can cut off 3 to 6 inches here (indicating).

By Mr. Mathewson:

Q. In width, do you mean?

A. No, in the height, and instead of having a 22 row, we run now about 16 and 17 row burners, in order to have the burner work under the same conditions now as we used to have a large burner work three years ago.

By Mr. Kirby:

Q. So you endeavor to regulate all your apparatus in accordance with the pressure which you expect to be supplied to it?

A. We have been obliged to, by reason of the low pressure, but the customer demands even a larger burner in order to heat a room.

Q. Now, he could burn more gas, could he not?

A. In a larger burner?

Q. Yes.

A. Yes, a larger area, provided you opened the orifice below.

Q. You took these pressure readings yourself, in some instances?

A. I have, yes, sir, quite a number of them.

5678 Q. You used a "U" tube, such as has been spoken of this morning?

A. Yes, I think ours is made by Gleason.

Q. Was that pressure taken at the meter?

A. No, sir; taken at the apparatus.

Q. Was it taken right by the stopcock to the apparatus?

A. Well, we have an arrangement, for instance the stopcock is here, here is a pipe running off here, that we put the gauge on, and the pipe continued with a T and the pipe continues off here (indicating) with the burner or apparatus, as you might say (indicating).

Q. So that the pipe which is connected to the "U" tube and to the Gleason tube, or whatever tube you use, is attached within, say, six inches or a foot of the stopcock of the apparatus?

A. Well, now, probably three feet.

Q. You have never made any test as to the calorific power of gases of different candle powers, have you?

A. No, I cannot say that I have. Our candle powers run about the same here.

Q. And you have never made any tests to show the number of heat units which would be developed by a gas in the City of New York burning at different pressures, have you?

A. No, sir, I have not.

Q. Your water heating apparatus carries a pilot light, doesn't it?

A. Yes, sir.

Q. By that you mean a light which is burning all the time?

A. Yes, sir. Well, what I speak of as water heaters is a heater that attaches to a boiler. We have sold a few of those large automatic heaters, but very few of them. We sell a great many of the ordinary heaters that attach to a boiler to heat a 40, 60 or 80-gallon tank.

Q. Well, those have a pilot light?

A. Yes, but it is not kept lighted all the time. It is only on the large automatic ones it is kept lighted.

5679 Q. And the burner for such apparatus is similar to those which you have heard described here this morning, or has it any peculiar features?

A. I think the burner is the ordinary Star burner or drilled burner.

Q. Have you ever taken any pressure readings between the stopcock of the apparatus and the point of ignition of the flame?

A. That is, you mean at the meter and at the flame?

Q. No; I mean between the stopcock to the apparatus and the point of ignition of the flame in the apparatus?

A. Of the water heater.

Q. Of the water heater.

A. No, sir, only on our own grates that we manufacture.

Q. Where did you test them?

A. Our own grates?

Q. Yes.

A. In our shop.

Q. And at what point of the grate?

A. Well, do you mean for heat units?

Q. Yes.

A. No, sir, only in comparison with thermometers in front of them; we have made some tests with thermometers as to the different sizes of the burners which we make for the gas grates. Do you know what an ordinary gas grate is?

Q. I do.

A. With the asbestos front?

Q. Yes, I am well familiar with it. Have you ever made any tests with pressures at the meters that Mr. Brock has made reference to?

A. No, only at the apparatus.

Q. Nor of the loss of pressure between the meter and apparatus?

A. No, sir; there would be very little difference, I should judge, between the——

Q. It would depend entirely upon the house-pipe, wouldn't it?

A. Something of that sort and the location of the meter.

Mr. KIRBY: That is all.

Mr. BURR: No questions.

5680 Redirect examination by Mr. MATHEWSON:

Q. Under a pressure of twenty-tenths or above, the pressure is sufficient so that the flame rises and covers your grate front without carbonizing, doesn't it?

A. Under a twenty-tenths pressure for the large size burner it would hardly cover the fulltop of the burner with twenty-four rows; we have been obliged to cut them down.

Q. Why you cut down when you have a lower pressure is because the lower pressure will simply cover the upper part of the grate with carbon and soot and it will be ineffective?

A. No, there would be no carbon, providing we cut the burner down.

Q. That is what I mean?

A. There might be a little dirt raised on the upper part.

Q. That is what I mean, you cut down the size of the burner capacity?

A. We have been obliged to on account of the low pressure. We had to in most all of our burners.

Q. In the City of New York?

A. Yes. Outside we have had few or no complaints, only in this city, New York and Brooklyn. We have had some complaints over in Brooklyn.

At 1.05 P. M. adjourned to January 17th, 1907, at 11.30 A. M.

Last Complainant's Exhibit 296.
State's 000.
City's 236.

5681 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

JANUARY 18, 1907.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby, Mr. Page.

5682 The MASTER: Note on the record that the adjournment on the afternoon of the 16th was at the request of Mr. Kirby, who had an imperative engagement, and counsel not objecting thereto; and that the hearing on the 17th was necessarily postponed on account of the engagement of the Master in the trial of a case in the Supreme Court.

WILLIAM H. CHILDS, called as a witness in behalf of the complainant, in rebuttal, being duly sworn, testified as follows:

Direct examination by Mr. MATHEWSON:

Q. Where do you reside, Mr. Childs?
A. 53 Prospect Park West, Brooklyn.
Q. Are you an officer of the Barrett Manufacturing Company?
A. I am vice-president.
Q. It is a company which purchases coal tar and ammoniacal liquors from the Consolidated Gas Company?
A. Yes, sir.
Q. Are you an officer of the American Coal Products Company?
A. I am vice-president.
Q. How long have you been in this business?
A. Fifteen years.
Q. Are you familiar with coal tar and the prices which are obtained for it, and the market prices?
A. Yes, sir.
Q. Both the raw product as received from companies and the price of the finished product after it has been treated or manufactured by the companies?
A. Yes, sir.
Q. What proportion of the coal tar of the United States do the companies of which you are an officer handle?
A. In excess of eighty per cent.
Q. It appears that the price received by the Consolidated Gas Com-

pany from your company is 2.24 cents per gallon for coal tar, 5683 the raw product. Is that lower than the market price in the City of New York?

A. No, sir.

Q. Do you know of any way in which the company could obtain a higher price than that in the City of New York from anybody?

A. No, sir.

Mr. BURR: Does he know whether the Consolidated Gas Company could get a higher price, is that what you mean?

Mr. MATHEWSON: I will put it in another way, if you object.

Q. Do you know of a way in which anybody in the City of New York could sell coal tar, the raw product, at a higher figure than the amount you pay the Consolidated Gas Company?

A. Not to average higher than that, no, sir.

Q. The value of coal tar depends upon the value of what products?

A. Do you mean in the purchase of it?

Q. Yes.

A. It is bought on a sliding scale, based on the value of pitch and dead oil, that is, creosote oil.

Q. And does the value of pitch and dead oil in the City of New York depend upon the market elsewhere?

A. Yes, sir.

Q. Where?

A. The foreign market.

Q. It is regulated by the foreign prices, in fact, then, isn't it?

A. Yes, sir.

Q. In the interior of the country, where freight is to be added to the cost of importation from a foreign country, what effect has that circumstance on the price of coal tar?

A. It does not affect it except to the extent of the foreign prices plus the freight; but the freight into the interior of the country is less than the freight from England or Germany to New York 5684 plus the New York freight from New York to the interior; that is, the through freight is less than the combined freight.

Q. So that the effect is as to the interior of the country, that, other things being equal, the coal tar will be worth a little more than in New York?

A. If it were dependent entirely upon the foreign price; in the interior of the country there is a large overproduction.

Q. Is coal tar a product which is scarce, or is it made in large quantities?

A. Very large quantities.

Q. Is it produced by gas companies alone, or by coke ovens as well?

A. There is more produced by coke ovens than by the gas companies.

Q. Now as to oil tar, is the market price and the value of oil tar as great as coal tar?

A. No, sir.

Q. How much less in New York?

A. In the purchase price—you are referring to the purchase price?

Q. Yes, I refer to the raw product as it comes from the gas companies.

A. About one-half cent per gallon less.

Q. Now, after your company receives the coal tar respecting which Mr. Edgerton testified, what do you do with it?

A. It is distilled.

Q. Have your companies large and extensive plants for that purpose?

A. Yes, sir, very large.

Q. Do they manufacture it into the final products which they sell?

A. Yes, sir.

Q. Do you have in that connection not only plants, but fleets of boats and other property?

A. Yes, sir

Q. You have stated that you take the coal tar from the Consolidated Gas Company. Do you take all the oil tar that they produce?

A. No, sir.

Q. Would you do so?

A. No, sir.

Q. It is used for burning, isn't it?

A. Yes, sir; we could not possibly handle it.

5685 Q. Now, Mr. Edgerton has testified that he made inquiries in the City of New York, I think from your concern, and found that five or five and one-half cents was the price for coal tar. What does that five or five and one-half cents refer to?

A. It is the retail price.

Q. Retail price of what, the finished product?

A. Yes, sir.

Q. Is that the price of the raw product as it comes from the gas company before you distil it and manufacture it?

A. No, sir, not in any quantity. For a few barrels——

Q. Is it possible to obtain that price in the City of New York for the raw product as far as your experience goes?

A. It could not be obtained.

Q. Did you ever know of a case where it was obtained in quantity?

A. No, sir.

Cross-examination by Mr. Kirby:

Q. Mr. Childs, what was the price you said you paid to the Consolidated Gas Company for their coal tar?

A. 2.24 cents. This is in 1905.

Q. What price did you pay them therefor last July?

A. A trifle less than that.

Q. What price did you pay them last November?

A. Approximately the same; I could not give you the exact figure, but it would vary very slightly; there are only slight variations during the year.

Q. Do you pay this price to them delivered at their yard?

A. We take it from their yard.

Q. How do you take it away?

A. In lighters, tank boats.

Q. Who delivers it on board the boat?

A. I think they do.

Q. Your price is, then, delivered on board; is that true, Mr. Childs?

A. I am not sure whether they do the pumping or we do; we have facilities for pumping on all our boats and I think in some cases they do it and in others we do.

5686 Q. What uses do you make of this tar?

A. We distil it and use part of it in the saturation of roofing papers and sell a large amount in the form of pitch for street paving work and some of it is sold for the purpose of making briquettes of pitch and coal, and most of the pitch is used in the roofing business, gravel roofing, perhaps you would understand it better.

Q. It has a great and growing use, hasn't it?

A. Yes, sir.

Q. I believe your company is the Barrett Manufacturing Company which manufactures what is known as Tarvia?

A. Yes, sir.

Q. Which is coming into general use for the purpose of spreading upon macadam roads to improve them?

A. And laying the dust. There were 5,000 barrels used last year for that purpose.

Q. And such use is growing in your opinion, is it not?

A. We hope so.

Q. Your company is a successful one, I take it?

A. I presume so.

Q. As a matter of fact it pays 10 per cent. dividends upon its capitalization, does it not?

Mr. Mathewson: Is that worth while, to inquire into that? I do not think it is pertinent, and I object to it. Supposing it does?

The Master: Has the witness any objection to answering?

Mr. Mathewson: I have not any objection to his answering, if he cares to.

The Witness: As a matter of fact it does.

Mr. Mathewson: Mr. Kirby is trying to prove that ten per cent. is a fair return for an industrial company.

Mr. Kirby: Yes, when it buys at this price and sells at a very large increase in price.

5687 Q. This distillation which you speak of, what are the products you get from that distillation, not coal tar?

A. No. Coal tar is the crude product.

Q. And that which you get from that is not known as coal tar, it is quite a different thing, is it not?

A. Yes, sir.

Q. It is not for the purpose of purifying the coal tar or driving any foreign matter out of it?

A. Some of it is, and some of it we sell as refined coal tar; Tarvia, for instance, is treated that way.

Q. But the product which you purchase from the Consolidated Gas Company is what is known as coal tar?

A. Yes, sir.

Q. And when a substance is sold on the market under the name of coal tar, it is your understanding that it is the same as that you buy from the Consolidated Gas Company?

A. Very little is sold in the form we buy it from the Consolidated Gas Company.

Q. It is quoted as such, is it not?

A. It is not the same quality.

Q. Wherein does it differ?

A. Coal tar differs much in quality, their coal tar is not suitable for the ordinary purposes that ordinary coal tar is sold for as coal tar.

Q. What do you mean by ordinary coal tar?

A. I mean coke oven tar, for instance.

Q. Do you purchase coke oven tar?

A. We do.

Q. How much do you pay for that?

A. Our average over the United States for nine hundred thousand barrels of coal tar and gas house tar in the year 1905 was 2.28 cents.

Q. That is four-tenths of a cent over and above that which you pay the Consolidated Gas Company?

A. Yes——

Mr. MATHEWSON: Four one-hundredths.

The WITNESS: Yes.

5688 Mr. MATHEWSON: Including this superior coke oven tar and all qualities?

The WITNESS: Yes, that is for all qualities.

Q. I take it you are familiar with the paper known as the *Oil, Paint and Drug Reporter*, are you not?

A. I see it occasionally.

Q. I call your attention to a quotation therein, on page 31 of the issue of July 23, 1906, Coal Tar in Oil Barrels, 50 gallons, $4.50 to $4.55. That makes a price per gallon of between eight and nine cents, doesn't it?

A. Including the barrel.

Q. No, excluding the barrel?

A. I think that price is including the barrel.

Q. That price is including the barrel, but 50 gallons at $4.50 to $4.55 is between nine and ten cents?

A. Counting the value of the barrel, which is $1, which is two cents a gallon from that for the price of the barrel.

Q. That would be between seven and nine cents?

A. It would be just seven cents in that quotation.

Q. Between $4.50 and $4.55, seven and a fraction thereover, which would be represented by the difference between $4.50 and $4.55. Do you figure in that the cost of a new oil barrel?

A. Of what is paid for the barrel, of what is paid for the oil barrel on the other side. Those are importations, I understand.

Q. But when they use barrels for this purpose they are not new barrels, are they?

A. No.

Q. Are you giving the figure of an old barrel such as would be used?

A. Old barrels over there are worth a dollar a barrel. May I ask the quantity of that importation?

Q. There is no quantity mentioned here. I am simply giving you the quotations for the prices of coal tar set down in the schedules there.

5689 A. Is not there the quantity? Is there not a final number of dollars and cents obtained for such an amount of tar, which would show how much the quantity was?

Q. I fail to find it here.

Mr. **Mathewson**: Have you any objection to the witness seeing it?

Mr. **Kirby**: Certainly he may, with great pleasure. (Handing paper to witness).

The **Witness**: It is not a shipment, that is a quotation.

Q. I call your attention to a quotation in the same journal under date of November 5, 1906, Coal Tar in Oil Barrels, 50 gallons, $4.40 to $4.60. That is a correct quotation, is it not?

A. That is what it reads there. I never saw any quotations before by that paper, and I do not think they are an authority.

Q. This journal gives quotations on oils, paints, varnishes, etc., drugs, acids, fertilizing material, and is a trade paper for that purpose, is it not?

A. Not for the coal tar business, no, sir.

Q. You have no reason to doubt the authenticity of such quotations, have you?

Mr. **Mathewson**: What do you mean by the authenticity of such quotation?

Mr. **Kirby**: As such quotations are usually given in a paper of this kind, either stocks or bonds or other matters.

Mr. **Mathewson**: No doubt it appears in the matter that you are calling attention to perhaps, but I do not know what you mean by the authenticity of the quotations.

Mr. **Kirby**: I asked him if he doubts it, and if so, why.

The **Witness**: They are not an authority.

Q. Which paper is the authority?

A. There is none.

5690 Q. Where would you go to find the quotation for sales or prices of coal tar?

A. I would ask the price of the dealers that sell it.

Q. Have you asked such prices?

A. No, sir. We sell it.

Q. You are not the only ones who sell it, are you?

A. No, sir. All those prices are maximum—few barrel lots.

Q. I call your attention to the heading at the top of this quotation: "Wholesale Prices Current. Note: Our quotations are those of importers and manufacture for original packages in large lots. For broken lots higher prices are asked."

Mr. **Mathewson**: What about that, is it some question, or are you reading the paper into the record?

Mr. **Kirby**: Mr. Childs has stated that such prices he understood were for small lots. I am reading the quotation from the paper to show——

Mr. **Mathewson**: You cannot do that unless some question is asked. I move to strike it out.

Q. I ask you whether you now wish to change your answer that it is for small lots?

A. I know it cannot be for anything else.

Q. But you do doubt the authenticity of such statements?

A. I know they are not authentic.

Q. You are familiar with the paper, are you not?

A. I simply know there is such a paper. We never use it.

Q. Your company is the Barrett Manufacturing Company of Philadelphia?

A. No, sir—New York and Philadelphia. They may advertise in it; I don't know.

Q. I call your attention to the *Oil, Paint and Drug Reporter* of November 25th, 1906, and to page 16 thereof and ask you if that is an advertisement of your company?

5691 A. It is an advertisement of our chemical department, yes, sir.

Q. That is part of your company, is it not?

A. Yes, sir. I never saw it before.

Q. I call attention to the advertisement in the issue of Monday, November 19th, 1906. The last page thereof:

"Carbolic Acid; Barrett Manufacturing Company."

A. Yes.

Q. And I ask you if that is your company?

A. Yes, sir.

Q. You here state that you are "Exclusive producers and the only manufacturers in this country of all grades of carbolic acid," and so on. That is a statement of your company, is it not?

A. That is our company's advertisement; yes, sir.

Q. And as a matter of fact, in all of these issues which I have here I find an advertisement of your company. So your company is familiar with this Journal?

A. I said I was not familiar with it.

Q. But you are an officer of this company?

A. I am. I never saw those advertisements before. I did not know we advertised in it.

Q. Are you familiar with the market quotations of coal tar?

A. I am familiar with the prices at which we sell them, yes, sir.

Q. I asked you if you were familiar with the market quotations?

A. I don't think there are any such things as market quotations.

Q. Then you are not familiar with any market quotations of coal tar?

Mr. **Mathewson**: I think he has answered the question. I object to further pushing on that.

Q. Are you familiar with the prices obtained abroad on 5692 the sales of coal tar by the gas company?

A. No, sir

Mr. **Mathewson**: I object to that as immaterial and irrelevant anyhow.

Mr. **Kirby**: The witness has stated that the price depended on the price in the foreign market.

The **Master**: Well, he says no; that is an answer.

Q. What basis do you use in your conclusion that your price is based upon the price obtained in the foreign market?

A. I did not say so.

Q. Then the foreign market has nothing to do with the price here?

A. On the contrary, it has everything to do with the price of importations of pitch and oil. I am not talking about coal tar; I don't know what they pay.

Q. Pitch and dead oil, you have testified, come from coal tar, have you not?

A. Yes, sir.

Q. And what percentage of the bulk does pitch represent?

A. If it was all distilled, about sixty-five per cent.

Q. And dead oil?

A. About thirty per cent. more, twenty-five to thirty per cent.

Q. Making ninety-five per cent. of the total, the price of coal tar would be a proper basis of comparison of the price of these two, would it not?

A. No, sir.

Q. Are you prepared to state the price obtained abroad for pitch and dead oil?

A. I can give you the price of pitch in certain parts abroad.

Q. Do you know whether there is any duty in this country on the importation of coal tar?

A. I do not think there is.

Q. Do you know whether there is any duty on the importation of pitch?

A. I do not think there is.

5693 Q. Do you know whether there is any duty on products from coal tar?

A. Only on the very finer products which are not manufactured in this country.

Q. Do you know the freight from England to this country?

A. Only approximately.

Q. Would the freight on coal tar from England here be as much as a cent a gallon?

A. I should think it would be more than that.

Q. Do you think it would be as much as two cents a gallon?

A. I think about two cents, probably.

Q. Which would mean that to meet such prices as you pay the

Consolidated Gas Company, the coal tar would have to be sold in England for less than a quarter of a cent a gallon, would it not?

Mr. MATHEWSON: That is a conclusion.

The WITNESS: You are confounding the retail price obtained by shipping it here and the price paid the producer.

Q. You pay the Consolidated Gas Company 2.24 a gallon, don't you?

A. We do, yes, sir.

Q. If the freight, as you have just stated, of coal tar from England here is more than two cents, it would mean that to meet the market which you make in this way, the companies there would sell at less than .24 of a cent?

A. The freight on coal tar has nothing to do with it. It is the freight on pitch and dead oil. The prices are based on pitch and dead oil. Coal tar is not imported except in very small quantities.

Q. The freight on coal tar and on pitch and dead oil would be approximately the same; their weights do not differ very much?

A. Approximately the same.

5694 Q. So that the freight on a gallon of one would be approximately the same as the other?

A. Approximately.

Q. Do you wish it to be understood that there is no trade paper which gives quotations upon the market value of these products, which quotations would be recognized?

A. No. I do not know of any trade paper which gives authentic quotations of the market value of pitch and dead oil in this country.

Q. Do you know of any abroad?

A. Yes, there are several that give the prices over there.

Q. They would not be authorities on the prices here?

A. No.

Q. Do you know whether or not those papers state the price of coal tar in England at less than one-quarter of a cent a gallon?

A. I should not think they would. There is nothing to indicate that they would. The price of coal tar here has nothing to do with the price which we pay the Consolidated—has nothing to do with the freight on coal tar here. In other words, the freight on coal tar has nothing at all to do with what we pay to the Consolidated for the — based on the price of pitch and dead oil.

Q. Do you also buy the ammonia from the Consolidated Gas Company?

A. Yes, sir.

Cross-examination by Mr. BURR:

Q. Mr. Childs, was the price for coal tar higher in 1906 than it was in 1905?

A. No, sir; a little lower, a trifle

Q. In other words, you got more in 1905 from the Consolidated Gas Company for coal tar?

A. We paid them more.

Q. You paid them more than in 1906?

A. I think so; a little more, I think.

Q. You don't happen to have the exact difference in 5695 amount of price, do you?

A. No, I haven't the exact difference in mind, but I should think it might be one-eighth cent less than in 1906; that would be my impression.

Q. And as to 1904, did you pay less or more that year than in 1905?

A. I couldn't tell you without looking. The prices have not varied a great deal.

Mr. MATHEWSON: The contract is in evidence, Mr. Burr.

Redirect-examination by Mr. MATHEWSON:

Q. Do you not at all times pay to the Consolidated Gas Company the full market value for their coal tar?

Mr. BURR: Objected to as calling for a conclusion.
Mr. PAGE: That is objected to.
Question allowed.
Exception.
Mr. PAGE: He stated there is no market price.
Mr. MATHEWSON: Market value.

A. We are obliged to under the contract.

Mr. BURR: I move to strike that out.
Motion granted.
Mr. MATHEWSON: Exception.

Q. Well, explain a little more fully.

The MASTER: I assume by "market value" you mean market price. It was in that aspect that I allowed the questions.

A. The price paid the Consolidated is dependent upon the price at which we sell pitch and dead oil. We sell pitch and dead oil at prices which are governed by the imported price of those two articles.

Q. And you are referring now to the written contract be- 5696 tween your company and the Consolidated?

A. Yes, sir.

Q. And that contract is in evidence. So that what you pay to the consolidated depends upon the price you get for pitch and dead oil, which are the products which you get from the coal tar?

A. That is right, sir.

Q. Now, you say that while you pay the company, the Consolidated, 2.24 cents the average throughout the United States is 2.28 cents. Does that 2.28 cents include the inferior quality of coal tar which you obtain from the coke ovens, and also any coal tar which you obtain at higher prices by reason of its being in the superior and subject to freight rates?

A. Yes, sir.

Q. If you were not paying the full value for coal tar would it not be possible for companies on the other side to come in and overbid you if they saw a profit?

Objected to as speculative.
Objection sustained. Exception.

Q. What are the quotations, so called, which have been called to your attention? For the raw product or for the refined and manufactured product?

A. I am sure I don't know what they are.

Q. You are familiar with the prices, are you?

A. Yes.

Q. Did you ever know of any such price, or do you know of such?

A. Only for a few barrels at a time.

Q. What proportion of the entire product in the United States does your company sell of these refined products manufactured here?

A. I should think in excess of 80 per cent.

5697 Q. What do you mean when you say that the price which you obtain in New York for pitch and dead oil, and consequently the price that you pay for your coal tar, is governed by the prices paid?

A. The large purchases of dead oil have always been in the foreign market and we consequently are obliged to meet the foreign price. There is no other market for it except for creosoting purposes, and we consequently have to meet those prices. In pitch we have to meet the foreign price in order to sell our product.

Q. Do you know whether there is any tariff duty in England as to pitch and dead oil produced here?

A. I do not think there is.

Q. Nor coal tar?

A. No, sir.

Recross-examination by Mr. Kirby:

Q. By your statement that you base your price to the Consolidated on the price you get for your refined products, you mean the prices you would get for your pitch and these other substances with chemical names mentioned here?

A. No, sir; it has nothing to do with it.

Q. You mean to say the prices you get for pitch and dead oil?

A. Only.

Q. Now, by the market price which you establish and get for these, do you mean the price for which you sell them to others than yourself, or which you get from yourself when you use them for the purpose of manufacturing Tarvia and other products?

A. Prices we receive from other people.

Q. What proportion of the coal tar which you purchase do you use in your own products?

A. The bulk of it.

Q. Almost all of it, do you not?

A. Not all of it. Tarvia is not used in our own products.

Q. You sell the Tarvia?

A. We sell it, but it is not pitch or dead oil.

5698 Q. No, but coal tar, is used in almost the total amount by yourself?

A. Yes, the bulk of the material is refined, if that is what you mean.

Q. What percentage would you say of the coal tar which you purchase do you in some way use in your own products?

Mr. MATHEWSON: Do not they have to use all of it.

A. I don't know what you mean. Would you call pitch and dead oil our own products?

Q. Yes, I would.

A. Well, the bulk of it then, we use in our own product.

Q. Ninety-five per cent. of it?

A. I wouldn't want to state the percentage, but the bulk of it.

Q. From this coal tar you produce these various substances to which I called your attention in an advertisement in this journal: Benzol, Toluol, Solvent of Heavy Naphtha and other coal tar oils?

A. In very small quantities; yes, sir.

Q. Also carbolic acid?

A. Very small quantities.

Q. Also that which goes to make up this Tarvia, whatever it is?

A. Yes, sir.

Q. Many others?

A. In a very limited degree, yes, sir.

Q. From coal tar, in addition to these substances which you have mentioned by name, there are numerous other chemical compounds produced?

A. Innumerable.

Q. And you produce them?

A. No, sir.

Q. Or employ that part, pitch and dead oil, which you get from coal tar?

A. It comes from the 5 per cent., yes, sir; in the pitch and dead oil; the pitch and dead oil represent about 95 per cent. of the distillation; the 5 per cent. goes into the finer products.

5699 Q. Do you manufacture those finer products?

A. We do not; only a few of them.

Q. And that constitutes the largest part of that 5 per cent., does it not?

A. I don't know. I am not familiar enough with the chemical end of it to tell you. I don't think so. They come from the lighter oils; all these finer products come from the light oils.

By Mr. MATHEWSON:

Q. Mr. Kirby has asked you if you did not use this coal tar in your own products, and you said yes. You use it in refining the products which you sell, do you not?

A. Yes, or in saturating paper, one or the other.

Q. And you sell those products?

A. Absolutely. That is the reason we use it.

Q. There are buyers of coal tar besides yourself, are there not?

A. Yes, sir.

Q. You are in competition with them, are you not?

A. We are.

Q. Do you know of any others paying a higher price for coal tar in the City of New York than yourself?

Mr. Kirby: Objected to.
The Master: Hasn't that been asked before?
Mr. Mathewson: Very good.

Edward H. Wardwell, a witness called on behalf of complainant, in rebuttal, being first duly sworn, testified as follows:

Direct examination by Mr. Mathewson:

Q. Where do you reside?
A. In New York; New Jersey and New York.
5700 Q. Are you connected with the Barrett Manufacturing Company?
A. I am.
Q. What is your position?
A. I am secretary of the company and manager of—my principal position in that company is as the manager of ammonia department.
Q. How long have you been in that business?
A. Thirty-five years; thirty-six, probably.
Q. You are familiar with the contract with the Consolidated Gas Company?
A. Yes.
Q. It appears that the Consolidated receives 28.83 cents per gallon for its ammoniacal liquor per ton of coal carbonized.

Mr. Kirby: Is the contract based on that?
Mr. Mathewson: Yes, it is based on that, I think.

The Witness: Well, not directly; it is based on a certain yield, the net price received by them depends upon the amount of ammonia they succeed in giving us per ton.
Q. Sulphate of ammonia?
A. Equivalent to sulphate of ammonia.
Q. And it appears they receive 1.36 cents for ammoniacal liquor per pound of sulphate?
A. I suppose that would be correct. It varies. The settlement varies according to the price of sulphates.
Q. But as an average price?
A. Yes, sir.
Q. Assuming that to be correct, I want to ask you whether that is a fair price for that liquor?
A. I consider it a very full market price.
Q. In the City of New York?
A. Taking into account the form in which we receive the liquor and the expense we have for collecting it and so forth.
Q. Now, you take that liquor on a chemical test, do you not?
A. Yes.
Q. Showing the actual ammonia as indicated?
5701 A. The theoretical contents in the ammonia charged to us; not in reference to what we can take out practically.

Cross-examination by Mr. **Page**:

Q. Are you the Mr. Wardwell who was connected with the Standard Oil Company?

A. I beg your pardon?

Q. Are you the Mr. Wardwell who was connected with the Standard Oil Company?

A. No, I am not, unfortunately.

Q. Was he related to you?

A. So remotely that I should not be able to trace it. I believe though they did come together somewhere near the time of the Mayflower.

Q. You say that this price which you pay for ammoniacal liquor to the Consolidated Gas Company is the fair market price. Is there a quotation anywhere in existence of the market price for ammoniacal liquors?

A. I don't think there is. I don't know of any.

Q. What do you mean by market price? How do you arrive at it?

A. I arrive at it, that I think that is as much as other people pay. It is as much if not more than I individually am paying outside of New York.

Q. What prices do you pay for sulphate of ammonia?

A. In this contract we pay for the ammonia, a sufficient quantity of ammonia to represent a pound of sulphate of ammonia, a certain price according to the market value of sulphate at that time for that month; it rises and falls.

Q. What was the market value of sulphate of ammonia in July, 1905?

A. That I have not the figures of here. I do not remember.

Q. What was the price of it in November, 1905?

5702 A. I couldn't tell you, in the neighborhood of three cents.

Q. How near three cents?

A. It may have been a little over or a little under three cents. I cannot tell. It varied frequently.

Q. Was it as high as 3.18 cents?

A. I think it was at one time.

Q. During the year 1905?

A. If my memory serves me, I should think it was during 1905 that the highest price was reached for several years. However, I am not positive about those dates.

Q. You say you fixed your price here according to a theoretical test?

Mr. **Mathewson**: No, he didn't say that.

Q. What do you mean by a theoretical test?

A. I mean a test which shows the theoretical value of this liquor, every bit of it; and a test which also shows——

Q. What is the standard of ammoniacal liquor?

Mr. **Mathewson**: Won't you let him complete his answer?

Mr. **Page**: Certainly. I will withdraw the last question until he completes his answer, if he has not completed it.

The WITNESS: This test also indicates the presence of the amount of material which is reckoned as ammonia which is not ammonia, which we have to get rid of, but the Gas Company gets the benefit of that. It is known as the distillation test, made by their own chemist.

Q. A distillation test is the exact test for ammonia, isn't it?

A. Exact test for the contents of the ammonia contained in the ammoniacal liquor; what is known as the distillation test is inaccurate.

Q. Of the ammonia that is in the ammoniacal liquor?

5703 A. And of the alkaloids which are similar to the ammonia, they are also present; they are counted as ammonia, but they are not ammonia.

Q. How do you get, by distillation, the alkaloid?

A. Because they are very similar in character to ammonia. They are distilled off.

Q. What other alkalies are there that would evaporate by distillation that you find by this test?

A. Ammonia and pyridine are the only volatile substances.

Q. In this distillation test, did you distill the ammonia over sulphuric acid?

A. No, sir; nothing of the sort.

Q. How do you do it?

A. A measured quantity of ammonia is placed in a flask with a certain quantity of lime or caustic soda sufficient to decompose all the salts of ammonia contained in the liquor. The great bulk of the ammonia contained in the ammoniacal liquor from the gas works is in a compound form, carbonates and sulphides and so on, and by this distillation those forms are broken up and the ammonia is carried over into sulphuric acid and converted into a sulphate to determine the exact amount of the ammonia. Your question, as asked, whether it was done over sulphuric acid, did not seem appropriate. I could not answer it that way.

Q. Now, this is a very simple operation, isn't it, this distillation test?

A. Simple, but it has to be conducted by very intelligent and careful men to be accurate. A matter of a half a pound represents 50,000 gallons.

Q. The price the Consolidated Gas Company is receiving for its ammoniacal liquor is determined by this test?

A. The quantity which they are to be paid for is dependent upon that.

Q. And the quantity regulates the price because if there is a certain percentage of ammonia in the ammoniacal liquor then 5704 they receive a certain price for it?

A. Yes.

Q. So this test really determines the price they shall receive for their ammoniacal liquor?

A. I should say it came back to that.

Q. And you, the purchasers, are the ones that make this price?

A. No, sir; the Gas Company makes it in their own laboratory with their own chemist. Dr. Elliott has the supervision of that, and I take for my own protection against the Gas Company an average sample of the liquor received from them during the year and send it to analytical chemists and take their tests.

Q. Then you wish to change your testimony which you gave on direct examination that the price was governed by a theoretical test that you took?

A. Oh, no, I didn't say that. I said the Consolidated made the test. I expressly said—made in the laboratory of the Consolidated Gas Company.

Q. My recollection may be wrong or yours may be. At any rate, the testimony is there and it will show.

A. Well, that is w-ong, because I don't make the tests.

Q. Now, this test which you have spoken of is the exact process of the manufacture of sulphate of ammonia?

A. No, sir; not exact. It is, in a way.

Q. Wherein does it differ?

A. Only in the manufacture of sulphate of ammonia——

Q. Well, with the exception that in making the test you use a very small quantity, and in manufacturing you use a large quantity?

A. Yes, we use a large quantity and a small quantity of lime in manufacturing sulphate of ammonia. The volatile ammonia salts would be driven over and decomposed in the saturation of the acid, and it wouldn't be necessary to do it with lime as is done in this test.

Q. Then the manufacture of sulphate of ammonia is a simpler operation than this test?

5705 A. In the plain operation of it, yes. None of them are very simple.

Q. I said more simple.

Mr. Mathewson: And the witness said "none of them are very simple."

A. I do not consider it a simple operation to make the test you speak of. The test by which the value of liquor is determined. But the general principle of the operation is the same.

Q. It is not very intricate; it is a simple matter of distillation?

A. It is distillation.

Q. Any man that can light a lamp or build a fire under the flask, can set the thing going and can distil, can he not?

A. Yes, he can. There are lots of them do it.

Q. There is no intricate machinery that has to be handled in making the test?

A. There is some very good machinery, some very good apparatus in order to do it successfully or properly.

Q. Now, having ascertained that sulphate of ammonia, will you please take the price that you have given and give us the operation by which you arrived at the price you are to pay the Consolidated Gas Company for its ammoniacal liquor?

A. Well, the test as applied by the gas company determines the amount of ammonia, the percentage of ammonia per gallon of liquor. It determines it by finding out how much sulphuric acid the ammonia in a gallon of liquor will utilize. Upon that I base a calculation as to how many pounds of sulphate of ammonia can be obtained per gallon of liquor, and we take so much per pound for that ammonia. If they deliver, say 50,000 gallons of liquor which will by test show a product of six ounces or seven ounces or eight ounces of sulphate of ammonia per gallon, the total figures 5706 up so many pounds of sulphate and we pay for that.

Q. Do you figure, then, how much you pay per gallon of the ammoniacal liquor?

A. No, I could figure it, but I never did.

Q. I mean when you pay for it?

A. No. Yes, certainly; the bill is rendered for so many gallons of liquor, so many ounces and strength equal to so many pounds of sulphate of ammonia and that is what we pay for. Of course, the gallons of liquor have to be taken into account, but I came near answering what I did not mean. I did not take into account the value per gallon. We do not figure it that way.

Q. How do you fix your value of your sulphate of ammonia?

A. The market price.

Q. Where do you go to obtain the market price?

A. We obtain the price from the brokers and dealers, importers of sulphate of ammonia in this market——

Q. And do you send around yourself or is the*ir* some price current, or a trade paper?

A. Well, this drug journal reports the prices of sulphate of ammonia. If you were buying it you would pay probably a pretty good price, but we send to the trade and they give us an average price during the month, and——

Q. You give your quotations?

The Master: You do not let him finish, Senator.

The Witness: We take the quotations given us by other dealers and it is part of the contract, I believe, with the gas company, that we shall deal with the gas company on the basis of the average price as determined by the actual business done during the month, and that we learn from what we do ourselves and also what the 5707 importers do. They give us their price and we make up our reports on that. The gas company has the right to verify that, and can verify it at any time by going to the market.

Mr. Page: I would like to strike out the last part of it. It may be interesting, but I think it is entirely immaterial and irrelevant as to what the gas company can do.

The Master: Strike it out.

Mr. Mathewson: Exception.

Q. Are you through with your answer so that I can propound another question?

A. I am, sir. I won't talk so much the next time.

Q. Now, you give your quotations yourself, don't you, to this drug paper, the *Oil, Paint and Drug Reporter?*

A. I do not. I do not think they come to us for quotations. They may, possibly.

Q. And yet you are the largest manufacturer in the United States on those particular things, is that right?

A. I have not stated any such thing as that. We are not.

Q. Well, I supposed that you would agree with the man that was on the stand last time.

Mr. MATHEWSON: Of coal tar. That is quite another proposition.

The WITNESS: That is very different.

Q. Well, if you will allow me to finish a question as well as you finish an answer—I say he testified in regard to that, in regard to coal tar, that you were?

A. Yes.

Q. Is that the only particular in which you have this preeminence?

A. I don't know anything else that we sell except coal tar and ammonia; coal tar in its various forms and products.

5708 Q. What about your ammonia, you are a very large purchaser of that?

A. The Barrett Company manufactures ammonia products only here in New York. They manufacture tar products all over the country.

Q. And so far as the New York market is concerned, you are a pretty large dealer, aren't you?

A. Yes, sir.

Q. Then when we come to the New York conditions that we have heard of so frequently, your company and their price would have quite a controlling effect on the market, wouldn't it?

A. Well, it might.

Q. Are you familiar with the prices of sulphate of ammonia as late as November of last year?

A. I do not follow the prices of sulphate of ammonia very closely. I am not manufacturing any sulphate of ammonia at the present time and my department of the business is not selling any sulphate of ammonia.

Q. Well, are you the man that fixes the price that has to be paid to the Consolidated Gas Company for its products?

A. No; I cannot say that I am. The information comes through the regular office channels, and I do not see it half the time.

Q. Who is that man?

Mr. MATHEWSON: The contract in evidence in that regard regulates the prices.

Mr. PAGE: It does not show the man who has to fix it.

Mr. MATHEWSON: It has been in force for years, and is in evidence.

Q. Are you familiar with *Newbigging's Hand Book for Gas Engineers and Managers?*

A. I don't think I ever saw it.

Q. A very interesting book——

Mr. MATHEWSON: But not very accurate.

5709 Mr. PAGE: Not for the purposes of the Consolidated Gas Company.

Mr. Mathewson: Not for any purposes.

Q. I call your attention to this: "The manufacture of sulphate of ammonia from the ammoniacal liquor is becoming general in gas works, and properly so, as the process is both simple and profitable. * * * The apparatus required in its manufacture is neither complicated nor costly; the process is free from danger (though fatal accidents have occurred through the carelessness or the use of imperfect appliances) and an intelligent laborer can learn it in a week's time."

Do you agree with that statement?

A. Not wholly, no.

Q. You do in the main though?

A. Well, I should think that somebody might write that that didn't know much about it.

Q. Have you ever heard of Thomas Newbigging?

A. No.

Q. Do you consider yourself superior in the knowledge——

A. No, not at all.

Q. Of chemistry?

A. Only that statement is put in such general terms that it does not seem to me to have much value.

Q. No, it would not be valuable to a manufacturer of sulphate of ammonia to have the gas companies going into the business of manufacturing it; is that what you mean?

A. No. That didn't occur to me.

Mr. Mathewson: I object to that. It is hardly worth while to spread that on the record.

Cross-examination by Mr. Burr:

Q. What are you paying to-day for ammoniacal liquor?

A. I can't tell you. I haven't seen the basis of percentage for last month. The accounts are settled once a month, based upon 5710 the average price of sulphate during the month. I was away from business and I did not see it at all.

Q. Does that suffer much of a fluctuation in price?

A. Well, it fluctuates. It is hardly ever exactly alike.

Q. About how high or how low from a given figure?

A. The highest I remember for several years has been about 3.18 to 3.20, and the lowest for two or three years I should say at least has been 2¾.

Q. What is the highest price you have ever paid the Consolidated Gas Company for its ammoniacal liquor?

A. I can't tell you.

Q. Do you mean you cannot recall?

A. No, I cannot recall.

Q. Did you have anything to do with the making of any of the contracts with the Consolidated Gas Company for the purchase of this liquor?

A. Yes, I had something to do with their negotiating those contracts, arranging the terms, the method of test and all that.

Q. Do you remember the first contract you made with the Consolidated Gas Company?

A. It is a good while ago.

Q. Did you make a contract in 1899 with the Consolidated Gas Company?

A. Very possibly. I do not remember the date.

Q. Has it been your object to make the contracts for a year or for a series of years?

A. Usually for five years or ten years we used to make them.

Q. What has been your object in making a contract for five years?

A. Because we had to expend a very large amount of money in plants, machinery and facilities for handling the business, and if we had only a contract from year to year our works would be put up at auction every year for another bidder.

Q. And if you get an agreement at a low price you want
5711 to hold on to it as long as you possibly can?

A. Naturally. We want an agreement at good prices. We want to preserve our plants. I have lost two or three plants in my own individual experience by losing the contracts. It became scrap iron where I had an expensive plant.

Q. You made a contract, I understand, on June 24th, 1898, which was continued until June 12th, 1903; is that correct, to the best of your recollection?

A. I presume it is. I don't recollect dates, but I presume that is correct.

Q. You do not recall the price fixed, do you now, by the contract?

A. I think the price fixed at that time was the price of the present contract, at least, the contract that is running now.

Q. And the contract which covers the coal tar also covers the ammoniacal liquor, does it?

A. That is a separate contract. I never had anything to do with that.

Q. You hadn't anything to do with the coal tar?

A. No.

Q. Mr. Carter testified, on page 977 of the record, that the average price received during the year 1904 was 1.34 cents per pound of sulphate. Does that agree with your recollection?

A. I should think that was right; it must be right if he states it.

Mr. Mathewson: I think that is 1.36. If it is 1.34 I think it is a clerical error. You will find a number of figures in going through the record where slight errors have been made. I merely call your attention to it, because I think that is the fact.

Mr. Page: It is 1.34 in Exhibit 94, so if it is to be corrected in the testimony it should be corrected in the exhibit.

Mr. Mathewson: Very likely one was read from the other in answering the question. It is simply my recollection that
5712 it is 1.36; that is all. It is not a material difference. I may be wrong.

Q. It was also asked, "What average price per gallon or per ton of coal carbonized did you receive for coal tar for the same period?

A. 28.59 cents. Q. Per pound? A. Per pound of coal carbonized." Do you recall anything about that?

A. For ammonia?

Q. No, for coal tar?

A. I don't know anything about it.

By Mr. PAGE:

Q. The production of ammonia in the United States and its use has very largely increased, hasn't it, in the past few years?

A. Yes.

Q. And in the six years from 1898 to 1904 you know there has been an increase of 350 per cent. in the product.

A. I know it was a large increase, because the coke oven industry was getting under way in those years and is accountable for pretty much all the increase in the amount of sulphate manufactured. There is very little manufactured by the gas companies in this country.

Q. And the price has continued to rise, hasn't it, notwithstanding?

A. It has remained very firm, and has been strong in spite of the increase of sulphate of ammonia, fertilizing industries taking more sulphate of ammonia than we anticipated.

Q. Do I understand that this price that you have given of 1.34 or 1.36 is per pound of sulphate, in the question that was read to you by Mr. BURR?

A. That is what it figures out that we paid. It is for ammonia enough, a sufficient quantity of ammonia to make a pound of sulphate of ammonia. We get it in the form of a liquor containing about 1 per cent. of ammonia—1 to 1½ is a maximum.

5713 Redirect examination by Mr. MATHEWSON:

Q. And the ammoniacal liquor that you thus obtain you have stated you had to manufacture and convert into the products which you sell?

A. Yes.

Q. Now, the quotation has been read to you of 3 three cents or such a matter for sulphate of ammonia. Isn't that the manufactured product?

A. That is the finished product ready for market in boxes and barrels, whatever it is shipped in.

Q. It is not for enough ammoniacal liquor to produce that sulphate?

A. No, sir; the acid has to be purchased and other things.

Q. Now, as a matter of fact, I will ask you if the figures specified in the contract to which counsel has called your attention was, at the time of the making of the contract, fair in your judgment?

A. I consider that very fair. In fact, the utmost that I could advise my company to pay, that is what I was guided by.

Q. Is there not a sliding scale which gives the company an advantage if they show a higher grade of ammoniacal liquor or if the sulphate shows a higher price in the market?

A. There is a sliding cost on sulphate; it goes up; they get proportionately more.

Q. And if their liquor is richer they get more, it means the same thing?

A. There is a limit to the strength of the liquor. I don't think the old contract specifies that they shall have any advantage in the strength of the liquor.

Q. They took an average strength?

A. It was agreed that if the liquor went below a certain strength, what is known as six-ounce liquor by distillation test, that then there should be some negotiation, some reduction of value, because the——

Q. As a matter of fact, sulphate of ammonia is imported, isn't it?

A. Very largely.

5714 Q. And you are in competition with the foreign sulphate?

A. All the time. It regulates the price.

Q. Do you make sulphate of ammonia largely, or is the product that you make from this ammoniacal liquor anhydrous?

A. I am manufacturing anhydrous and strong aqua-ammonia. For the last year or so I have not manufactured any sulphate.

Q. Now, in testing ammonia, isn't it a very delicate operation, if you desire to get results—testing am-oniacal liquor?

A. Testing the value?

Q. Yes, sir.

A. It is an operation which requires the very greatest care and skill, which I would not entrust to anybody but a skilled chemist.

Q. And as to the manufacture of the raw product to produce your products, doesn't that require a man of skill and experience to get good results?

A. Well, I don't think they could be done by a man who was not skilled; in fact, that is what I am paid for.

Q. You would not want to trust a common laborer to do that and expect good results, would you?

A. The successes in that line of manufacture depend very largely upon the character of the apparatus and the handling of the business obtained by the director of the plant.

Q. And has your company in existence a large and expensive plant for the purpose of producing these products?

A. Quite large. I suppose about $300,000 we have invested in the ammonia plant alone.

By Mr. **Burr**:

Q. Your object in buying this am-oniacal liquor is to get it as cheaply as you possibly can, isn't it?

A. Naturally.

Q. Having such an expensive plant?

A. And yet, that is not quite true, because we have aimed
5715 always to pay a price so fair and so full that we would not be liable to be beaten by competitors. It was for the safety of our business to pay the full values. Those have been my instructions, in negotiating these contracts, from the officers and directors

of the company, to pay just as much as I could possibly recommend them to pay.

Q. But, so far as this record shows, there was no competition in 1889 or 1901, when you arranged the continuance of that old contract?

A. I don't know what the competition was. They didn't tell us who were bidding against us. There were bids against us, I believe.

Q. You have no knowledge yourself that there was any competition?

A. The officers of the Gas Company have never been so frank with me as that.

George W. Doane, called as a witness in behalf of the complainant in rebuttal, being duly sworn, testifies as follows:

Direct examination by Mr. Mathewson:

Q. Mr. Doane, are you an officer of the National Coal and Coke Company?

A. I am president.

Q. Which is it, "Coke and Coal" or "Coal and Coke"?

A. "Coke and Coal."

Q. That is the company, is it not, of which the Consolidated Gas Company owns all the stock, which has been referred to as the Carting Department of the Consolidated Gas Company?

A. It is.

Q. Does it take the coke of the Consolidated Gas Company and sell it?

A. It does.

Q. So far as the Consolidated does not use its coke in its water gas apparatus.

A. Yes, sir.

5716 Q. It has been put in evidence as to the prices that were obtained for coke by the Consolidated in 1905. In addition to those prices which are paid to the Consolidated Gas Company by the National Coal and Coke Company, the National Coal and Coke Company also pays its profits and dividends to the Consolidated Gas Company, does it not, except such amounts as may be reserved for working capital?

A. It does.

Q. So that ultimately the Consolidated Gas Company gets the benefit of all the profits of the National Coal and Coke Company?

A. All the profits that they have.

Mr. Page: I suppose this can be reprinted in your brief, Mr. Mathewson. It is entirely argumentative.

Mr. Mathewson: We will see.

Q. Now, a criticism has been made by Mr. Edgerton in reference to the price received for coke in the City of New York. I want you to state what efforts, if any, the National Coal and Coke Company, through yourself or under your direction, have been making in the sale of coke and as to the possibility of getting higher prices for it than you are getting?

A. As I understand it, the National Coal and Coke Company was organized for the purpose of increasing the market for coke. And, of course, as we increase the market for the coke, we are able to get a better price. But the price of coke is regulatd by the price of anthracite coal. If we get the price of coke too high, we cannot sell it. We have got to confine it at a point at which the local public will take coke in preference to anthracite coal, and our endeavor is to familiarize people who are not using coke with the use of coke and with the advantages of it, and to assist them to make experi-
5717 ments which will induce them to use coke. We do that by the medium of canvassers and salesmen, by advertising and printed matter and by assisting them in making experiments. We even go so far, where we feel encouraged, to give them coke and to assist them in making the experiments. And where their boilers are not suited for the use of it, we go to the extent of advising them to change their grate bars, so they will be enabled to burn the screenings to the best advantage, to get the most economical results from it.

Q. Are these efforts to familiarize the public with coke and induce them to burn it continuous?

A. They are.

Q. Will you state what the disadvantages are of coke as compared with anthracite, in view of the suggestion that coke ought to sell for substantially anthracite prices.

A. Coke is a free burning fuel; it is porous in its character, and as it is ordinarily used in the same appliances that are used for anthracite coal, it burns so much more freely and rapidly that the consumer cannot get the same economical advantages from the use of coke that they can from coal, and that is what makes it difficult to install coke. As fuel is used in domestic houses and even in business concerns, it is more or less under the control and direction of employees, and they will not and cannot be made to take the amount of supervision or the regulation of the drafts of coke which enable it to burn with economical advantage, and the result is that coke has got to be marketed and always will be in New York City at a materially less price than anthracite coal. There are other disadvantages about coke. Coke is more bulky to store. It is more difficult to handle, and all of those work against the installation of coke and make it more difficult to market it.

Q. If the draft is left on, as you call it, coke being a quick burning fuel, what is the effect on the grate bars?

5718 A. You have an intensely hot fire and the result is that the grate bars and bricks are speedily melted down. We often have consumers who give up the use of coke and give that as the reason for it, that they have ruined their furnaces and stoves, and will not use it any longer.

Q. So as to furnaces, you can load up a furnace with anthracite coal, can you not, so it will keep the fire in all night?

A. Very difficult to do it.

Q. I am referring to anthracite coal?

A. Yes, with anthracite coal, yes.

Q. How is it with coke?

A. It is very difficult to do it with coke. It requires the closest kind of regulation, and careful attention, so that the fire will last over night. I have tried it in my own house during the coal strike, and found it of the utmost difficulty to do it by giving it the most careful personal attention, and in the average house they cannot do it; and that militates against its use for domestic purposes.

Q. Now, Mr. Doane, there is at present a shortage of coal in New York, is there not, and coke, by reason of the coal famine in the west?

A. There is a shortage of bituminous coal.

Q. On account of the coal famine in the west it is being rushed in that direction?

A. Yes.

Q. Has that rendered it possible for you temporarily to make any advance in the price?

A. Yes, sir.

Q. How much?

A. We are selling it now at $3.35.

Q. That is 10 cents advance?

A. That is 10 cents advance within the last month. The previous advance was in October, 1905.

Q. What is going to be the effect on the coke market and the price to be received for coke by throwing on the market the product of the Astoria unit when it is in full operation?

5719 A. It is going to be an extremely difficult matter to market the coke for anything like the price we have been getting.

Q. Do you think it will be possible, so far as you can see, to market coke at any higher prices than were received in 1905?

Mr. **Burr**: Objected to as incompetent, irrelevant and immaterial, being merely a conclusion of the witness and purely hypothetical and not in rebuttal to any evidence that has been presented here.

Mr. **Matherwson**: Yes, Mr. Edgerton testified that we ought to get, I don'- know how much, for coke, just as much as anthracite coal, and all that.

The **Master**: I will allow it.

Mr. **Burr**: Exception.

A. Not in any large quantity.

Q. Is it not a fact that what is known as free-burning anthracite sells for less than normal anthracite?

A. I don't think here in New York there is much difference between the free burning anthracites and the harder grades of anthracite. I think I am accurate about that. I think that the price ruling here by the retail dealers is a uniform rate, $6.50 a ton at the present time.

Q. When your company receives coke from the Consolidated Gas Company it has certain expenses in connection with it before and in connection with the sale, has it not?

A. Oh, yes, large expenses.

Q. How do results, so far as the Consolidated Gas Company, compare in reference to its receipts from coke as a residual since the organization of the National Coke & Coal Company, with the results so far as the Consolidated Gas Company before that? That is, are they now more favorable or less so?

5720 Mr. BURR: Objected to as incompetent, irrelevant and immaterial, not being proper rebuttal.

Objection overruled. Exception.

A. The company, as I said, was organized for the purpose of widening and broadening the market for coke. Since then we have marketed all the coke that the Consolidated Gas Company has for sale. At the time of the organization of the company there were large quantities of coke stored in all the stations; in some of the stations they were very much congested; at one time we had between thirty thousand and forty thousand tons of coke in storage. That works to great disadvantage, because it means additional handling to the Consolidated Gas Company, trimming of piles, the waste of coke from breakage and disintegration leading to a much larger percentage of screenings and breeze, which is sold at a reduced price.

Q. The result of the work of the National Coal & Coke Company?

A. And the selling price of coke has been raised from $2.75 to $3.35 in that time.

Q. The result of the work of the National Coal & Coke Company is the better selling of the coke and at a higher price per ton?

A. It has added largely to the profit of the coke business.

By Mr. BURR:

Q. And to the credit of the president of the company, I presume?

Mr. MATHEWSON: Unquestionably so. That is all.

Cross-examination by Mr. PAGE:

Q. Besides being president of the National Coal & Coke Company, what are you other offices?

5721 A. I am president of the Northern Union Gas Company, vice-president of the New Amsterdam Gas Company.

Q. What about the Central Union?

A. I am not an officer in that company.

Q. Are you besides being vice-president of the New Amsterdam Company, the general manager of that company?

A. Vice-president and general manager.

Q. How many canvassers and salesmen did you employ in the year 1905?

A. I should say they averaged four or five.

Q. Did you pay them anything?

A. Certainly.

Q. Will you take the State's Exhibit U for identification and find out under what item that payment is given?

A. They are all under the head of expense.

Q. Now, let us analyze that head of expense. How much salary did you get?

A. $500.

Q. $500?

A. Yes.

Q. Were your canvassers paid in proportion to the salary paid to the president?

Mr. Mathewson: Are you claiming he has been extravagant?

Mr. Page: It may be. That depends entirely.

Q. How much of that $13,830.10 of expenses was paid——

A. Mr. Brewster's salary, I think, is—I may not be strictly accurate, but probably near enough for your purposes; I did not fortify myself for that—I think he is paid $2,000 a year.

Mr. Mathewson: Who is he; what is his office?

The Witness: He is the general man in charge of the office; he spends half to three-quarters of his time outside visiting customers and that sort of thing. Then Mr. Miller is paid a salary of 5722 $1,200 a year. And there is another young man whose name I do not catch who is paid $12 a week. Then Mr. Fox, at 42nd Street Station, I think, is paid $3 a day, and then we have another man whose name I do not catch whose salary, I think, would be between $2.50 and $2.75 a day. That covers the four men.

Q. You, of course, devote little of your time to this National Coal & Coke Company?

A. I give a good deal of it to it; part of every day; particularly at the present time.

Q. Were any of these men that you have spoken of, canvassers?

A. They all act in a canvassing capacity; some of them, in addition to their salaries, get a commission for all business they bring in. And then, in addition to that, I might mention, too, that we have a standing offer of 25 cents a ton as a commission to certain men who are not in the employ of the company, for business which they influence and divert towards the company. We have a Chinaman, for instance, who has done very good work among the Chinese laundries; we pay him a commission of 25 cents for every ton of coke that he places on the books. That, I think, is the same commission that the coal people pay for the sale of coal.

Q. Well, all of the expenses, I suppose, of your office amounted to $13,830.10 a year?

A. That is right.

Q. In 1905?

A. Yes, I presume that is right.

Q. That includes, you say, salaries for your canvassers, the officers' salaries of the company and, I suppose, stationery?

A. And stationery.

Q. And books?

A. And books.

Q. And all the ordinary office expenses?

A. And all the ordinary office expenses.

5723 Q. Doesn't it include some rents?

A. No, we do not pay any rent in that; it is a separate item there, is it not?

Q. I see $1,800, so it does not include that?

A. No.

Q. You say you have also sent out very largely advertising matter and circulars?

A. Yes, sir.

Q. Did you send out any in the year 1905, or is it something you have recently begun?

A. Yes, we sent out in 1905, I should say, two or three hundred thousand.

Q. And was not that the first time that you had sent out any?

A. No, we have done that for a number of years, several years. I think we have done more of that perhaps within the last two years than before that.

Q. What were those, postal cards that you mailed to people?

A. No, they were printed matter calling attention to the advantage of coke. They were not in any sense postal cards at all. Calling attention to the advantages where it was for sale, what could be done with the fuel, and calling attention to the price and inviting people to communicate with the office and give us an opportunity of demonstrating to them the advantage of coke.

Q. How did you distribute those, through the mail?

A. They were put in every gas office, and as the receipted bills were sent out to the consumers throughout the district, they were inclosed with their bill, besides being mailed direct from lists that we had prepared. But the advantage to the coke company in having them sent out that way was that we saved postage, and we got communications in the hands of the people all over the city.

Q. I noticed that this extensive advertising in the year cost $111.25. That included the cost of the printed matter and postage?

A. No, I do not think any of that went into that. I think that
advertising is what the term advertising would mean, some-
5724 thing paid for a newspaper insertion or something of that
character.

Q. Then are we to charge up this to expenses?

A. That printing would also go into the expense item.

Q. That would also go into the expense item of $13,830.10?

A. Yes.

Q. In so far as you sent out matter in the mail, did you put a 1-cent or a 2-cent stamp on them?

A. I should imagine the Consolidated Gas Company would have to put a 2-cent stamp on its letters.

Q. I am not speaking of the Consolidated Gas Company. You said you also sent out from a list yourself?

A. Yes, those would go in a 1-cent envelope, those containing our own matter exclusively.

Q. Have you got any of those circulars with you?

A. Not with me, no. I would be glad to send you one if you would like to see it.

Q. You say the price of coke is dependent somewhat upon anthracite?

A. Entirely so.

Q. That is, if one rises and falls the other rises and falls?

A. Not entirely that, because an increase of 25 to 50 cents in anthracite coal would not make any appreciable difference in the market for coke, but if anthracite coal should cost $10 a ton, we, of course, would get a very much increased price for our commodity. But an increase of 25 to 50 cents would not make any difference, I do not think.

Q. Then you do come in competition with anthracite coal?

A. Entirely so, entirely so, entirely so.

Q. What has the shortage in the bituminous market got to do with the increase in price?

A. It has reduced the amount of coke which we have had for sale, consequently as we have had less coke for sale we can insist upon getting an increased price.

Q. That is, there being a shortage in the bituminous coal in the west, it has reduced the amount of coke which you handle?

5725 A. Produced here in New York City. We have less coke to handle.

Q. Do you mean to say that the Consolidated Gas Company has been making less gas and using less coal by reason of this shortage?

A. They have been using less bituminous coal and making less coke.

Mr. MATHEWSON: We are very seriously crippled at our coal gas plant now.

Q. Now, what is the difference between anthracite prices and coke prices?

A. Anthracite coal, just at present, is selling for $6.50. In April, you will probably remember, the coal people reduced their sel-ing price of coal.

Q. Yes.

A. I think last April it was $5.75. Then they added ten cents a ton a month until they got to $6.25; then it stood at that price until recently, and now the anthracite people, during the time when carting is difficult in the street, charge twenty-five cents more, so the selling price at the present time is $6.50. The price we are getting now is $3.35 for a load, which is what we call a chaldron.

Q. Yes, fifteen hundred pounds?

A. It does not weigh fifteen hundred pounds; as a matter of fact, it weighs nearer fourteen hundred than fifteen hundred, but in round numbers we call it fifteen hundred pounds. I think an average of eighty thousand loads of coke weighed fourteen hundred and forty pounds or fourteen hundred and fifty pounds. What does it amount to per ton?

Q. How much is it per chaldron?

A. $3.35. If the chaldron weighed fourteen hundred pounds it would be $4.71 per ton, and if it weighed fifteen hundred it would be $4.40.

Mr. MATHEWSON: Long or short tons?

The WITNESS: Short ton, two thousand pounds.

5726 Q. I understand that you anticipate that the manufacture or starting of the Astoria plant is going to break the coke market?

A. It is going to make it more difficult to market coke at anything like the present prices.

Q. Do you expect the National Coal and Coke Company will handle the Astoria coke?

A. I think they will sell what coke is sold at retail in New York; they have all the plant and all the equipment, I imagine they will.

Q. The ovens of the Astoria company will produce a higher grade of coke, will they not, than those that are being used at the Fourteenth and Forty-second Street plants?

A. I hope so, but at the present time the grade is very inferior.

Q. Well, that is a new plant, just starting up?

A. Yes, I imagine it will be better coke later on, but at the present time there is a great deal of complaint about the coke. It is dirty and smoky and it does not give the satisfaction the old coke did. Some people have refused point blank to use it.

Q. Can this coke which is produced by you be used in the manufacture of iron at all, pig iron?

A. No, I do not think so, it is too porous for that, too soft.

Q. That manufactured by some other gas company is used in iron and it can be in copper and some other metals?

A. I do not think so. It may be that the Otto coke is used, but to a very limited degree; the Connellsville coke is what they want. It brings $7 a ton in the New York market, what little is sold. It is used for metallurgical purposes.

Q. Have you heard of the plan to build some large iron plant on the shores of New York Bay, in which will be utilized some of the iron ores from New Jersey?

A. No, that has not come to my knowledge.

Q. You have not looked into that as a possible field?

5727 A. We will, if there is an opening there, we will be after it. If there is any opportunity to market any coke there, we will be after it.

Q. In Astoria they will produce more coke by a great deal than is being produced now by the various companies on the Island of Manhattan, will they not?

A. Yes, sir.

Q. And you expect to be the selling agent. Have you made any investigation at all to see how you are going to dispose of this large quantity?

A. We are, we are working on this problem now. I am, that is the reason I made the remark I did some time ago.

Q. Before they entered into the building of this large plant which would make this large amount of coke, was any investigation made by you to see what you were going to do with the product?

Mr. Mathewson: This National Coal & Coke Company has been in existence since 1901 or 1902, and Mr. Doane is not an officer of the Consolidated Gas Company and the Consolidated Gas Company began the construction of the Astoria plant before the National Coal & Coke Company was incorporated. What the Consolidated Gas Company figured as to disposing of their product, Mr. Doane does not know, except it may be as hearsay from time to time.

Q. As the proposed selling agent of the stock of coke which is to be produced at Astoria have you received any information from the officers of the Consolidated Gas Company as to the places that you could dispose of this large amount of coke?

A. I have been looking around myself to find places.

5728 Q. But I say, have any of the officers of the company communicated with you the results of any investigation they may have made?

A. Yes, I have had conferences with them and am having them now.

Q. And is it your expectation to build up the sale of the coke of Astoria with this sending Chinamen around at 25 cents per ton and ways of that kind, or is there some large wholesale place that will take your product?

A. There will have to be built up a trade very much in excess of what John Chinaman uses. At the present time I have made no effort to market any coke outside the Island of Manhattan. Of course, contiguous to Manhattan there are Brooklyn and Jersey City and all the places that can be reached from the river and all of those we expect to tap, and we hope to get a class of trade here in New York that we never have had.

Q. Do you expect to furnish to the Long Island Railroad or Pennsylvania Railroad any of your coke?

A. Well, that is something that has been spoken of. We have for a number of years sold a large quantity to the New York & New Haven. The New York & New Haven have taken from us for a good many years. The Central are taking some now.

Q. Do you know anything about the price of coke in Jersey City?

A. We sell some coke in Jersey City, but as we cart from New York, and that involves the paying of the ferriage, etc., it makes the cost high; I could not tell you just exactly what we are getting for coke there; it is considerably in excess of what we get in New York.

Q. Have you any competitor in the coke business in the City of New York?

A. I would hardly style them as a competitor; there is a little lot of coke sold here which is brought from Camden, and there is some Pennsylvania coke sold here which is used for metallurgical purposes that our coke, as I said before, is not suitable for, 5729 so I would hardly call them a competitor. It is used for that specific purpose. Outside of that, our coke has practically no competitor.

Q. The Otto coke you spoke of is sold to private consumers, is it not?

A. Very small amounts, a very small amount; there is a man over on the east side that has issued an advertisement as having that coke for sale, and we have tried to ascertain what business he was doing there, and we have not been able to locate but two consumers of ours that have used his coke, and one never duplicated the order. I do not think he does anything; he is a coal dealer over on the east side.

Q. Would it surprise you if that man gets as high as $5.50 per ton for his coke?

A. If he does, he does not sell much, if any, very little; he may sell a load or two and do something like that; we could get as much as that for ten or fifteen loads.

Q. More of the Otto coke is sold in Jersey City than here?

A. Yes, because they have a yard over on the Hackensack River, very likely.

Q. Do you know the price they are getting for their coke in Jersey City?

A. Only in a general way. They have two or three carts that are carting bagged coke in paper bags, that they sell for ten cents a bag, and I don't exacly know how much it weighs; I have the data at my office; they are doing a little business with tenement house people. They tried to introduce that same trade in New York City, and we were very glad to see them do it, because in New England they do some trade of that character. We have had in mind that there was a possibility of developing some of that trade in New York. They tried to introduce it in New York, but they have sold very little, and they have apparently been so discouraged at their efforts that they have stopped it. We have gone to those people who 5730 bought it, and they said they would not buy it any longer, that the people who bought it in bags were dissatisfied, and there was not anything in it, and so far as I know they are not doing any business here. But in Jersey City there is a different trade from what there is in New York, but I think they only have three or four wagons.

Q. At ten cents a bag, that would amount to six dollars per ton?

A. Yes, I should imagine it would be about that, but it is very expensive to handle it that way. We tried for several months to sell coke in that way, and we spent nearly $4,000 in making the experiments, and I think as the result of that $4,000 expenditure we sold not over 1,500 loads of coke.

Q. You have no idea of the extent of the business of the Otto Company in New York City, have you?

A. I think I have; I do not think they are practically doing anything here now.

Q. That being a relative amount, if they have sold since October, 10,000 tons, would you consider that a small amount?

A. No, I should think that was a pretty good amount. I know very well they have not done it.

Q. How do you know that?

A. We have men whose business—who are detailed for the purpose of following their wagons in New York, and the Otto people have tried to sell us coke. They have come to us and quoted coke as low as $2.95 a ton to me, and have been very anxious for us to take hold of it. There is quite a little Otto coke going into Brooklyn, but it does not come to New York. Of course, in Brooklyn at the present time we have no facilities for delivering coke there, so we are very glad to see them sell it there. I pass their yards every day and am familiar with the amount of coke which they have on storage and which they appear to be handling.

5731 Q. Now, I will ask you whether you know the price which is received for coke in Brooklyn?

A. The price in Brooklyn ranges from $3.50 to $4, according to the distance from the ferry, so I have been advised.

Q. Is that per load?

A. That is per load.

Mr. **Page**: That is all.

By Mr. **Burr**:

Q. Mr. Doane, do you buy or deal in any other coke than the Consolidated Gas Company's coke?

A. None whatever.

Q. Have you been president since the organization of this company?

A. No, it was organized in 1901, the beginning of 1901, and I became president, I think, in the beginning of 1902.

Q. Can you state what year you were the most successful in the operation of the business of this company?

A. I don't know that I know how to answer that. I think in the business——

Q. When did you begin to make more money during the time that you have been president?

A. The times we have made the most money was when we were handling coke for the railroad. The railroad trade was particularly profitable, because we had a station at 42nd Street, and the cartage from 42nd Street to the railroad station was a comparatively short one, and taken in trucks in large quantities it was very profitable, and there were a couple of years when the earnings of the National Coal & Coke Company showed more than in other years; but I personally do not judge of the success of the Coke Company alone by the money it is earning. It is by the results we accomplish in developing and extending the use of coke, that is the purpose for which it was instituted.

5732 Q. You organized that and it attends to the disposal of the coke of your own company, the Northern Union?

A. The Central Union disposes of its own coke.

Q. And who disposes of the Northern Union?

A. They do not make any coke; they buy the gas from the Central Union.

Q. How about the New Amsterdam?

A. They make no coke. It is a so-called water gas station.

Q. Did you attend to the disposal of the coke before the organization of this company by the Consolidated Gas Company?

A. Before the organization of the coke company?

Q. Yes.

A. No.

Q. Had nothing at all to do with it?

A. No.

Q. And the only experience you ever had was since you have been president of this company?

A. Yes. I ought to modify that. I was secretary and treasurer of the New York Gas Light Company for a good many years and they manufactured coal gas entirely for a good many years and they marketed all their output of coke in New York, and as secretary and treasurer I did have general charge of that.

Redirect examination by Mr. MATHEWSON:

Q. The trade of the railway company was lost for what reason, do you know?

A. The installation of the electric plant.

Q. Now, with reference to delivering your product in Jersey City or Brooklyn, or anywhere outside of Manhattan, would that mean an additional investment in plant?

A. Yes, that would mean that we would have to have depots established at those points, which we undoubtedly will.

Q. What is the effect on coke of handling it, loading it and unloading it and transporting it by lighters and otherwise?

5733 A. Every time you handle coke it breaks; that increases the percentage of screenings or breeze, which has to be sold at a very much reduced figure.

Q. So, in dealing with the sale of coke outside of Manhattan, you would have to obtain a large enough price to take care of the extra amount of capital and the extra cost of transportation and the extra amount of loss by breakage, and so on?

A. Yes.

Q. In reference to handling the Astoria coke, if that assumes large proportions, will that require an addition to your plant and facilities?

A. It will.

Q. At what price is the National Coal and Coke Company selling the coke to the consumer?

A. At the present time?

Q. Yes.

A. $3.35.

Q. In the Island of Manhattan?

A. In the Island of Manhattan.

Q. Now, you spoke about the Central Union coke. Were the conditions at the Central Union plant in the Bronx favorable or unfavorable for receiving a larger price than was received in Manhattan?

A. They have always been able to market their coke at a better advantage than we have downtown.

Q. State some of the reasons.

A. I think one of the principal reasons is that they manufacture a moderate amount. They have a large territory to supply, which is made up of a class of people that are somewhat different from those living in tenement houses downtown, although the character of that district now is changing in that respect. They also have an opportunity to market a good deal of coke among contractors and builders. It is a particularly desirable fuel to use in portable boilers, and one of our large sources of income down here is in that way. It is a quick fuel, and these portable boilers in the street can get up steam in a very few minutes by the use of coke, and it seems to be a very popular fuel among those classes of people and they have a large 5734 amount of trade in the Bronx, where the building interests have been active for a long time. Those seem to be sufficient to enable them to market this coke without any difficulty.

Q. And do they market it as a rule without storage and cartage?

A. And without storage; they are exceedingly well situated in that district. They load their coke from bins and the result is that their percentage of breakage is very much less than it is where it has to be transported on boats or on the water as taken out on elevators, etc.

Q. Do you know of any concern that is selling coke in large quantities in the City of New York to retail consumers at any higher price than you are obtaining for your coke?

A. There is none selling large quantities at any price.

By Mr. Burr:

Q. But they are, in selling in small quantities?

A. Small quantities, of course. Connellsville coke is sold here in small quantities at a very much larger price, but that coke I understand costs $5.35 on landing here.

By Mr. Page:

Q. That is an entirely different coke?

A. Yes, it does not compare with gas house coke, it is a different fuel entirely.

By Mr. Mathewson:

Q. Could this other coke to which you refer be sold in large quantities in your judgment, that is in such quantities as the Consolidated Gas Company produces, at an average figure higher than you sell yours?

A. No, it is impossible.

At 1.20 P. M. adjourned to 2.30 P. M.

5735 After Recess.

George W. Doane resumed.

By Mr. Mathewson:

Q. Your attention was called to what coke was selling for in small lots or otherwise, as the testimony shows, in Brooklyn and Jersey City. Why did not the National Coal & Coke Company send its coke across the river and sell it there to get this price?

A. We had no conveniences in Jersey City for the storage of coke, and any coke we sent there would have to be sent from New York.

Q. How about Brooklyn, too?

A. And the long cartage and ferriage involved, etc., has never proved it to be an attractive trade to us for the price we could get; and the same reason applies to Brooklyn.

Q. Is there any coal-gas plant in Brooklyn in operation that you know of?

A. I am under the impression that there is no coke made there now.

Q. So that coke sold there would have to be transported from some other point?

A. Transported from a large distance.

Q. Yes. And do you consider that the company would get less if it went to the expense of transporting?

A. We would net less if we delivered coke over there than we would in Manhattan.

By Mr. PAGE:

Q. Do you know what the Kings County Company make?

A. Is that the South Brooklyn Company? They used to make coke, but not now. It is entirely a water-gas plant, if you mean that station down——

Q. Fifty-ninth Street?

A. Yes, way down there. They are not making any coke at all there now.

5736 By Mr. BURR:

Q. Is that also true of the Flatbush Gas Company?

A. I would not want to say positively about that.

CHARLES G. FRANKLIN, a witness called on behalf of complainant, in rebuttal, being duly sworn, testifies as follows:

Direct examination by Mr. MATHEWSON:

Q. How long have you known the plant of the Consolidated Gas Company at 44th to 46th Streets, west of Eleventh Avenue, in the City of New York?

A. Since 1876, I think.

Q. And for how long a period has the company occupied the land which is the bed of the projected 12th Avenue, and shown on Exhibit 48 btween 44th and 46th streets?

A. Since 1876 or 1877.

Q. Has that been fenced in and used by the company since that time?

A. It has been fenced in and used by the Municipal Company all that time.

Q. And subsequently by the Consolidated Gas Company?

A. Subsequently by the Consolidated Gas Company.

Mr. BURR: No questions.

Mr. PAGE: No questions.

5737 **Frederick K. Down**, a witness called in behalf of complainant, in rebuttal, being first duly sworn, testifies as follows:

Direct examination by Mr. **Mathewson**:

Q. Are you the manager of the 42nd Street plant of the Consolidated Gas Company?

A. Yes, sir.

Q. How long have you known the plant upon 41st and 42nd Street, west of 11th Avenue?

Mr. **Burr**: May I inquire what the object of this testimony is?

Mr. **Mathewson**: You threw in some suggestions or maps and so on, which purported to show that the company was not entitled to the use of this land, not entitled to it, and I think we discussed that the other day when the testimony was introduced.

Mr. **Burr**: I submit he cannot prove adverse possessions against the city by this witness or Mr. Franklin.

Mr. **Mathewson**: That is a matter of argument, of course.

Question allowed. Exception.

A. I have known it since 1862.

Q. Now, on Exhibit 48, there appears to be indicated a projected avenue between the bulkhead line and the bulk of the plot. For how long has the company been in occupation and enjoyment of that section covered by the proposed street?

Mr. **Burr**: I object to that question as incompetent, immaterial and irrelevant.

Question allowed. Exception.

A. Since 1870.

Mr. **Burr**: No questions.

Mr. **Page**: No questions.

5738 **Albert Riblet**, a witness called on behalf of the complainant, in rebuttal, being first duly sworn, testifies as follows:

Direct examination by Mr. **Mathewson**:

Q. Are you the superintendent of the 14th Street plant of the Consolidated Gas Company, East River and 14th Street?

A. Yes, sir.

Q. I show you Exhibit 48 and refer to the blocks between Avenue D, Tompkins Street, 14th Street and 16th Street, and also refer to the plot on the westerly side of Avenue D, between 15th and 16th Streets. How long have you known that property?

Mr. **Burr**: That is objected to as incompetent, immaterial and irrelevant; on the further ground that the company, the complainant in this case, cannot establish its title to the property in question by such testimony as this witness is called upon to give.

Question allowed. Exception.

A. I have known that property since 1866.

Q. How long has the company been in the occupation and enjoyment of those three parcels which I have indicated?

Mr. BURR: Same objection to this witness's testimony all the way through.

Mr. PAGE: We join in the objection.

Same ruling. Exception.

A. I am positive since 1866.

Q. And been fenced in?

A. During that time always fenced in.

Mr. MATHEWSON: I have produced original deeds to the Manhattan Gas Light Company covering the 14th Street property, 5739 including the portions to which I have directed Mr. Riblet's attention, and offer them in evidence.

Mr. BURR: I object to these as being incompetent, immaterial and irrelevant.

Objection overruled. Exception.

Received in evidence and marked Complainant's Exhibits 297, 298, 299, 300.

THOMAS W. VARLEY, a witness called on behalf of complainant, in rebuttal, being first duly sworn, testified as follows:

Direct examination by Mr. MATHEWSON:

Q. What is your business?

A. Consulting engineer; electrical.

Q. How long have you been in the business of electricity?

A. Since 1888.

Q. Have you made tests as to electric currents, as to intensity and direction, etc.?

A. I have.

Q. How many years have you been in that business, or done that work?

A. That particular line since about 1895.

Q. In 1902, before the installation of the electric mode of propulsion on the elevated railways, did you make tests generally throughout the Borough of Manhattan as to electric currents and directions and power?

Mr. PAGE: Before you answer that I wish to object on the ground that this is not proper rebuttal. This is a subject that was taken up by the complainant in its direct case, and if they did not give such evidence as they wanted to at that time that is their misfortune. We did not open up any new subject in our defense, but 5740 merely called witnesses on the testimony they had given.

Mr. BURR: I make the same objection. The testimony given here by the complainant was through Mr. Addicks, Mr. Simpson and Professor Humphreys, covering certain conditions which they claimed because of what they discovered as to electrolysis. We made the best answer we could to the alleged facts they presented. Now, they are calling other witnesses at this time to go more extensively into that feature of their case, and I submit that that is not proper rebuttal, but is part of their main case.

Mr. Mathewson: If the Master please, the situation is this: Certain evidence was put in as to electrolysis and the damage done by it. In their case the defendants called Professor Seever and gave testimony in which they endeavored to establish that the electric difficulty did not come from the electric railway, and they have put in evidence which intimated that the grounding of the New York Edison Company might be found to be the cause of the electrolysis existing. I am now rebutting this by a demonstration that the electrolysis did not come from the Edison Company, and that it does come from the elevated, to rebut the exact propositions of the defense, and that is all.

Objection overruled.

The City and State except.

Mr. Page: I suppose the objection and exception can relate to the whole testimony here? We won't have to repeat it?

The Master: Yes, it may.

5741 Q. Did you make the tests indicated on this map and prepare the map or have it prepared under your immediate supervision?

A. I did.

Q. Describe the map and say what the different colored lines indicate, and what the different figures on the map indicate?

A. The colors are the difference of potential in reference to gas, and that is, the gas mains are positive, according to the colors, to the elevated structure and street railway. For instance, the green color here means that the gas main is negative to the street railway or the elevated along that line, and the red means that the gas mains are positive. The figures being the difference in potential between those points. Red where the gas is positive; green where it is negative.

Q. As to the gas mains?

A. As to the gas mains.

Q. And I see different points where these figures appear to indicate the points where you made your tests?

A. Yes.

Q. And are they a true statement of the difference in potential as you discovered it?

A. They are.

Q. Was the New York Edison Company operating at that time?

A. It was.

Q. And indicate about where, or state where, on the map?

A. Well, there are a number of places.

Q. Well, they are principally——

A. Their principal place is 38th and 39th Streets, East River, somewheres along in here.

By the Master:

Q. What is the significance of these hatchings on some of the lines?

A. That is a kind of erratic condition; very near neutral condition, practically neutral.

By Mr. **Mathewson**:

Q. So there is no difference in potential indicated along 5742 those lines?

A. That is the reason the figures are not shown, they are not put on.

Q. Close to the plant of the Edison Company at 39th Street, was there any difference of potential indicated?

A. No, only what you see. It was not there, or it was too slight to put on, very slight, indeed.

Q. Not appreciable?

A. Not appreciable.

Q. What is the meaning of your expression positive to the pipe or negative to the pipe?

A. Merely that the polarity is such that if you connect a wire between the pipe and the rail the current will flow from the pipe to the rail if the pipe is positive.

Q. And if negative?

A. Vice versa; backwards.

Q. Did you note the direction of the currents in these tests in making up your potentials as positive and negative?

A. We did.

Q. Now, the lower part in these green lines indicates immunity, doesn't it, from such difference?

A. Where it is green that shows it is immune from current leaving the pipe. If there was any at all it would be immune from it.

Q. Now, I see a red batch down here by the City Hall, or next to the entrance to the Brooklyn Bridge.

A. Exactly.

Q. And the electric cars were then running over the Brooklyn Bridge at that point, were they not?

A. They were.

Q. Now, after the Manhattan Elevated Railway was in operation, that is, a year later, in May, 1903, did you make further test and make another map?

A. I did.

Q. This map was made in May, 1902?

A. In 1902. Not exactly in May. It extended over two or three months.

Q. About that?

A. About that.

Mr. **Mathewson**: I offer that in evidence.

5743 Received in evidence and marked Complainant's Exhibit 301.

Mr. **Page**: I presume that as this is all new matter we will have an opportunity to rebut this, won't we, Mr. Master?

Mr. **Mathewson**: We do not consider that this is new matter. If it had been I assume it would have been excluded.

Q. Now is this the map which you prepared as the results of your tests made about May, 1903?

A. It is.

Q. Do the figures here, and do the green and red lines, indicate the same things as in the preceding map?

A. The same as before.

Q. Now, the red area as indicated on this map would be the danger area to the pipes, wouldn't it?

A. Yes, sir.

Q. And the green area would represent what?

A. The safe position for the pipes.

Q. I see the same red area here in the vicinity of the Brooklyn Bridge that was indicated on the previous map?

A. The same condition, yes, sir.

Q. And I find red areas on the avenues where the elevated railroad runs generally, and in some other sections, is that right?

A. Yes, sir.

Q. That would indicate, would it not, that the current was leaving the pipes in this down-town red area section?

A. It would indicate that it would be possible to leave it.

Q. A difference of potential?

A. Yes, sir; a dangerous condition.

Q. Now, the New York Edison Company had a distributing system all through this section in 1902, as well as in 1903, did it not?

A. Yes, sir.

Q. And sub-stations at one point and another?

A. Distributed throughout the city.

5744 Q. Do you find now a "danger area," as you call it, indicated by the red line near the station of the Edison, which was not there in 1902?

A. Yes.

Q. For Thirty-ninth Street. Was there any difference in conditions so far as the Edison Company was concerned at those two periods, so far as you will recall it?

A. I don't think so.

Q. Were you connected with the Edison Company?

A. Yes, sir.

Q. No difference?

A. No, sir.

Cross-examination by Mr. Burr:

Q. How are those maps made up? Did you have original data from which the maps were made?

A. Yes, sir.

Q. How long did it take you to make the examinations necessary to make that map which you are now testifying regarding?

A. Three or four months; maybe five.

Q. What was the procedure that you adopted?

A. To take actual readings with instruments, follow all along the line of the street, railways and elevated and cross-town.

Q. Have you got the book showing such readings?

A. Yes, sir.

Q. Were you assisted by anybody?

A. Yes, sir.

Q. By whom?

A. Some employees of the Edison Company.

Q. Do you know their names?

A. Yes, sir.

Q. Will you let me have them?

A. In the 1902 or 1903, which do you mean?

Q. Well, the first map.

A. 1902?

Q. Yes.

A. A man named Noe.

Q. What position has he with the Edison Company?

A. I don't know exactly what position, except he is there. He was assigned to me to help me on that work.

5745 Q. Did he point out the various distributing stations of the Edison Company to you and the various connections with those stations?

A. He did not have to.

Q. What particular part, then, did Mr. Noe take in getting up the data from which you made the first map which you produced here?

A. He did the actual reading of the instruments and working generally with me.

Q. Were you employed by Mr. Noe?

A. No.

Q. By whom were you employed?

A. New York Edison Company.

Q. Was Mr. Noe the only gentleman from the Edison who helped you to make up that first map?

A. Well, there may have been one or two laborers; I don't remember their names though.

Q. They were all brought to your aid by Mr. Noe?

A. No, they were set especially for me to use. I picked him out as somebody out of the ordinary.

Q. You thought he was fully familiar with the operation and work of the Edison Company and could give you all the information you needed?

A. No, I preferred him to help me out as knowing how to read instruments and that.

Q. With regard to the second map, who assisted you to get the data from which that was prepared?

A. A young man named Strong.

Q. Also of the Edison Company?

A. Yes.

Q. And some more laborers?

A. Yes.

Q. Practically under the same conditions as the first map was made?

A. The very same.

Q. And you were employed by the Edison Company to make that second map just as you were the first map?

A. Yes, sir.

Q. And you still have in your possession the original data from which both maps were made up?

A. I have.

5746 Q. Do you know whether the conditions which now exist have changed in any iota or in any character or degree from the conditions as they existed at the places on those maps in 1902 and 1903?

A. Well, 1903 has changed since 1902.

Q. In what respect?

A. Why, the red lines have extended down into the city; the danger zone, you might say, has increased.

Mr. Burr: That is all I have to ask with regard to that point.

Cross-examination by Mr. Page:

Q. When did the water-side station of the Edison Company begin its operations?

A. I am not sure; I think it was around 1900 or 1901.

Q. Did they abandon in 1900 and 1901 the various stations for manufacture that are scattered throughout the city?

A. No, it was just started up then, and that was sort of an auxiliary; they could not abandon the others.

Q. When did they abandon the others practically and manufacture all their electric currents at the water-side stations?

A. I don't think they have abandoned them yet.

Q. What sub-stations do they run?

A. They may be abandoned. I don't know as they are abandoned.

Q. Do not they manufacture current now at the water side, transmit it at a large voltage to these sub-stations and there reduce it?

A. I don't think they do manufacture it all there. Of course, I am not a member of the Edison Company and I would not state that with assurance, but I am sure they do not manufacture it all there.

Q. You are willing to admit they manufacture some?

A. Oh, yes; a great deal of it.

Q. Well, for that much, thanks. When was the three-wire system of lighting introduced in the City of New York? Can you tell that?

5747 A. That came a short time after Mr. Edison first put his plant in operation in New York City.

Q. When was this used in New York City for common or general use?

A. What year?

Q. Yes.

A. I couldn't say offhand; too far back.

Q. Can you approximate?

A. About probably 1890.

Q. Then I understand you to say that when the Edison system was first installed it was a three-wire system?

A. No, I don't say that.

Q. You said ever since the Edison system had been installed in New York City——

A. No, ever since about it was installed—the first ones he installed were two-wire. He didn't come to use a three-wire till later. It was a discovery of the three-wire system after using the two.

Q. And that was some years after the two had been used?

A. Some, but not very long.

Looking at this map (1903) I find that starting downtown and running up as far as Manhattan Avenue——

Mr. Mathewson: I do not think the second map was offered in evidence. I now offer it.

Mr. Burr: I ob-ect to the intr*do*uction of the map as incompetent, immaterial and irrelevant.

Objection overruled. Exception.

Received in evidence and marked Complainant's Exhibit 302.

Q. Looking at this map (Exhibit 302) I find that starting downtown and running up as far as Manhattan Avenue and Broadway it appears to be entirely a danger point?

A. Yes, sir.

Q. All red?

A. Yes.

Q. What elevated structure runs up Broadway?

A. That refers to the street railway and to the gas mains.

5748 Q. And that has no relevancy to the elevated structure?

A. Not on that particular one, no.

Q. Now, in making these tests what instruments did you use?

A. Weston.

Q. Weston what?

A. Voltmeters.

Q. Anything else?

A. For all those readings shown there, Weston Voltmeters.

Q. Now, as I understand, this red shows the intensity of the electric current that was flowing through those pipes?

A. No, sir.

Q. That was flowing between the pipe and the rail?

A. No, sir.

Q. Then tell us what it does show?

A. It shows the difference of potential between those points.

Q. Well, what points, for instance?

A. Gas pipes and the street railway or the elevated, as shown.

Q. Now, what do you mean by "shows the difference in potential between the street railway and the gas pipe;" what do you mean by it; interpret it into ordinary language?

A. When you say there is a difference of potential between two points, a volt, you mean there is a stress, an electrostatic stress of one volt, in electric terms. I don't know how *you* would pronounce it for you unless you might say a pressure between two points on a water pipe or between two water pipes.

Q. We will try and get it in this way—when the pressure is heavier on the gas pipe than it was on the railroad——

A. Where the gas pipe is marked red it means the gas pipe is elevated electrically above the surroundings.

Q. Let us get off the elevations and stick to the pressure you were talking about.

A. Pressure is an elevation.

Q. Not necessarily. Men are elevated sometimes when they are not under pressure, but let us use this phrase, if you will 5749 kindly stick to one particular illustration long enough for us to get that interpreted, and then we will take the elevation afterwards, if you wish; but there where it says "2" on the red line, for instance, on Complainant's Exhibit 302, does that mean that there is a greater pressure by two volts on the gas pipe than there is on the rail?

A. It means just as I say, a difference in potential between the gas pipe at the point and the rail at that point, of two volts.

Q. Now, you say there is a difference of two?

A. Yes.

Q. Does that mean there are two volts more on the gas pipe than there are on the rail, or two volts more on the rail than there are on the pipe?

A. Two volts more on the gas pipe.

Q. That is, that the gas pipe is carrying two volts more of current than the rail?

A. No, you cannot state it that way. You are mixing up electrical terms.

Q. Do you mean that the current is leaving the gas pipe and passing to the street railway system?

A. I mean it can do so.

Q. But you do not mean it was?

A. Well, I cannot see what is taking place under the ground.

Q. The instruments that you had then would not show whether currents were passing from the pipes back to the rail?

A. Not in that test.

Q. Would it in any case?

A. Yes, other tests.

Q. I mean in any you have shown on this map?

A. Not on that test, no.

Q. That is all we want, just what is put in here. Now, what do you say the green means?

A. It means the gas is of a lower potential, the way you put it, than the surroundings.

Q. No, that is the way you put it.

A. Then I will put it that way.

Q. That means what?

A. It means that the current could flow the other way.

5750 Q. That the current could flow from the street railway to the gas pipe?

A. To the gas main.

Q. Then all this map shows is the electric potentiality of the pipes at different places, is that all?

A. Relative to its surroundings.

Q. Relative to what surroundings?
A. Street railway or elevated, and such.
Q. Did you make any tests in regard to the subway?
A. The subway was not built then.
Q. By subways, I mean those that carry the telephones—electrical conductors?
A. Yes.
Q. Did you make any measurements in regard to those?
A. Yes.
Q. At the same time?
A. Yes.
Q. That is not shown on this map?
A. That is not shown on this map.
Q. And the relative potentialities of those are not shown as compared with this, in any way?
A. No, they are not shown.
Q. Then, as I understand, all this shows is that there is current flowing through these red lines or red pipe of such potentiality that it might possibly go back to the street railroad or elevated structure?
A. It is not current flowing necessarily, it shows its possibility, but if the current did flow, it would flow as you say.
Q. Then, as I understand, this map is based entirely upon possibilities, and not upon facts, is it?
A. Based upon facts of dangerous conditions.
Q. That is, that it is possible?
A. Exactly.
Q. That there is a possibility of something there, but it does not show anything that actually does exist?
A. Not on those figures, no.
Q. And there is nothing to show on this map from what source these stray currents that have electrified the pipes flow, is there, the currents, I mean, from what source they come?
A. Not on that particular map.
5751 Q. Nor on Exhibit 301?

Mr. Mathewson: 302, is it not?
Mr. Page: This is 302 and the other was 301.

Q. Is that right (previous question repeated)?
A. Not on that map.

The Master: Then he asked you what was the case regarding the preceding map, No. 301.

A. The preceding map has no dangerous area except the extreme end and this end.

Mr. Mathewson: You mean at the north end and south end?
The Witness: Yes.

Q. Then these two exhibits merely show a difference in potentialities, and do not show the flow of any current, nor the source from which the current comes in any way?
A. No.
Q. Now, just in what way did you make these measurements?

You say the difference between the gas pipe and the street railway. What part of the street railway?

A. The right part, where they stand side by side.

Q. Where what stand side by side, the rails of the street railway standing side by side with the gas pipes?

A. Standing right along the same section of the street as the gas pipe and the elevated pillars.

Q. Where was your test for potentiality made on the street railway?

A. Between the street railway and the point on the gas mains in the same section of the street, a cross section.

Q. A street railroad is made up of rails, is it not?

A. Yes, sir.

Q. And, also, there is some place where there is a conductor for electric current?

A. Yes.

Q. Now, where is your difference in potentiality between
5752 the conductor or the rail?

A. On the rail and on the pipe.

Q. Where on the elevated railroad structure?

A. On the pillars.

Q. Did you lay these pipes bare to make the tests?

A. Of the gas pipes?

Q. Yes.

A. No.

Q. How did you get at it?

A. Street lamps.

Q. Street lamps?

A. Yes. Of course, there are some cases where the pipe is exposed where you could do it, but, as a rule, street lamps.

Q. What do you mean by that, by street lamps?

A. Well, the street lamps come right up from the gas mains and that would serve as the potential conductor for you.

Q. Couldn't there have been a stray current from some other source to the lamp that would not come through the pipe?

A. I was not after that. I was after——

Q. I know you were not after it, but I am asking what could be?

A. It would depend upon the difference you want; if you want a difference in potential between the gas main and street railway and the lamp connected with the gas main——

Q. Assuming this fact, that conneted with that lamp or near the bottom of the lamp there was a leadcable carrying a current, could not that electrify this lamp and would not current flow from the gas main?

A. That would not disturb your test between the gas main and street railway. You would get that condition, no matter what caused it.

Q. It would be a test between the gas lamp and street railroad, would it not?

A. Yes, between the gas lamp and the street railroad.

Q. And not necessarily between the main and street railway?

A. Well, you will have gas mains or gas lamps—if by any chance they made no contact you would have to select another lamp; 5753 that is the only change we made in testing gas lamps, by taking a contiguous lamp across the street or something like that; but even if the gas lamp was connected with a cable, as you say, that would still act as the potential for that gas main for you, and would give you for the gas main what you are after.

Q. Take this three-wire system of the Edison Company, you have got a neutral wire there that you ground, have you not?

A. Yes.

Q. And if your current becomes unbalanced as between your other two wires, the current flows on the neutral wire, does it not, to the ground?

A. Yes, not necessarily to the ground; it flows on the neutral wire.

Q. Where does it go? It might go to a lamp post, might it not?

A. I don't think so.

Q. Then what do you do with it; it flows, it has to go somewhere, it flows along the neutral wire and it is grounded?

A. It flows between points of differential potential.

Q. Here is your neutral wire. As soon as it has a wire to travel on, the current will travel on that wire, won't it?

A. Not necessarily; if the wire connects two points of different potentiality then it will. The wire may be there and no current.

Q. I know, but I say, your two wires, and the current becoming unbalanced, the very purpose of having that wire is to carry off and so restore the balance between the wires?

A. Yes.

Q. And therefore, this neutral wire then absorbs the difference, if you may so express it, between the other two wires, and that current passes along that neutral wire, doesn't it?

A. Yes.

Q. And that neutral wire is carried down into the ground, is it not?

A. No, it is carried back to the station.

Q. How?

5754 A. It is continuous, keeping increasing all the way to the station, taking it up at different places as it goes along, one continuous wire.

Q. How does it get back to the station, do you mean that the third wire in this building runs back to the station?

A. Exactly.

Q. Through what?

A. Through the Edison three-wire system, neutral wire.

Q. Then that third wire is not grounded, is it?

A. Yes, sir.

Q. If it is a continuous wire running back to the station, where is it grounded?

A. It is grounded at the junction boxes and the station.

Q. Now, supposing you have these neutral wires running back and you have another neutral wire and there is a difference in potential of those two neutrals—that is, we call them neutral, meaning the third wire——

A. Yes.

Q. And there is a difference in potential, may there not be a flow from one neutral to the other through the earth?

A. No, not necessarily.

Q. No, not necessarily, there is not necessarily any flow here, but is not that a dangerous condition?

A. If there is a dangerous difference in potential there might possibly be so, surely.

Q. Well, is it not possible to be?

A. It is possible if there is a dangerous difference in potential. If there is a difference in potential there is a chance of current flowing.

Q. And is it not likely that the systems in different buildings would not be unbalanced to the same extent, and, therefore, your neutrals would always have a different potentiality?

A. In buildings the neutral is not grounded.

Q. You just said they were from this building, and, for instance, you said it went back and was grounded through the junction boxes, and I don't know what else.

A. Not in the building.

Q. No, but I said the wires from this building.

5755 A. The wires in any building are insulated. After leaving the building then you might have a ground.

Q. Well, that is what we are talking about. Now, are those the wires, the wires from this building that you are speaking of that are insulated and carried back to the Edison station?

A. They are.

Q. And that refers to the neutral as well as the other?

A. To the neutral, yes.

Q. Did you make any measurements at all as to the difference in voltage on the lamp posts and the voltage on the main itself; did you make any such tests, where you had taken a test of a lamp post, did you make a test on the mains?

A. That is between the lamp posts, do you mean, or along the main, or along a pieces of main, or what do you mean?

Q. Between the lamp post and the main, whether it was a piece of the main or along the main, whether you made any tests, I don't care, but whether you did make any tests between the potential on the lamp post and on the main?

A. Only as between two lamp posts.

Q. Then, we understand this represents the difference in potential between lamp posts and the street and not on mains, is that it?

A. Not necessarily. It means the mains.

Q. The only results you obtained were on the lamp posts, were they not?

A. No, I said the mains had been taken also where we could get them; the trouble is the mains are buried and you can't get them. These act as potential points.

Q. How many such tests did you make where the main was actually bared?

A. Well, in that case the main was bared, I should say, at every elevated station anyway, and a number of points between; I don't remember how many.

Q. Why at the elevated station?

A. The elevated stations were lit by gas then.

5756 Q. That is a service pipe up to the elevated station, isn't it?

A. Yes.

Q. So you did not take them there on the mains?

A. Well, that is quite a different condition from the lampposts, that is all, that is a straight screw connection.

Q. Then we will go back to the original question. Where, along that map, on Exhibit 302, point out any place where you took the measurement actually on the main in the street?

A. I cannot do it on that map.

Q. Can you do it on the other map, on Exhibit 301?

A. No, I cannot do it on the map. I would have to go back to the original records to see that?

Q. Were there many of them?

A. I do not think so.

Q. Well, were there any?

A. Yes, there were some. New York is always dug up, so you can get a number of chances.

Q. Wherever you were fortunate enough to find a place where the main was bared you took the measurement on the main, didn't you?

A. Yes.

Q. And not on the lamppost?

A. Yes.

Q. Now, you are not able to state whether the results of those measurements were represented on this map in green or in red, are you?

A. No.

Q. Those actual measurements of potentials which you took in the mains themselves?

A. No.

Q. Do you know whether these lampposts you took the measurements of were attached to Consolidated Gas Company mains or Mutual Gas Company mains or Standard Gaslight Company mains?

A. I could not tell you offhand.

Q. Well, you paid no attention to that, did you?

A. No, we took them right straight along, one after the other.

Mr. Page: That is all.

5757 By Mr. Burr:

Q. What was the object of your employment, was it to ascertain by this examination, which you say you made at these various points, what the effect of the Edison wires was upon the gas mains in the street?

A. No.

Q. What was it?

A. To find what the condition of the street was in general for anything, if there was any dangerous condition.

Q. Dangerous condition to what?

A. To the gas mains.

Q. You were employed by the Edison Company to ascertain whether there was a dangerous condition to the gas mains?

A. Yes, sir.

Q. In 1902, and again in 1903?

A. Yes.

Redirect examination by Mr. **Mathewson**:

Q. In Map 301, I observed a red or danger area near the Brooklyn Bridge, to which I called your attention, and the other red or danger area was along the route of the 135th Street overhead trolley and radiating from there for some distance, was it not?

A. Yes, sir.

Q. This upper end?

A. Up and down, yes. There is 135th Street (indicating).

Q. And do you know the overhead trolley line runs through 135th Street?

A. Yes.

Q. Once currents are let loose, assuming that they are by the elevated or trolley system, or by any other force, they would run along the conductors in a way, would they not, including the rails of street railway lines that cross?

A. Any chance at all they get for a good conductor they would follow it.

Q. And up Broadway on those rails?

A. Everywhere there is a good conductor.

5758 Q. Are you personally familiar with any substantial change in conditions in the streets of New York, electrically, between 1902 and 1903, except the electrification of the elevated railways to cause such a change?

A. No change.

Q. When it comes to test the difference in potential between the gas mains and rails you would connect your instrument both to the gas mains and to the rail in some way, wouldn't you?

A. Exactly.

Q. If there is a rod running up from the gas main, either in the shape of a service or a lamppost, it would simply save running your wire so much farther, wouldn't it?

A. Exactly.

Q. Would it make any difference in potential, so far as your test is concerned?

Mr. **Page**: Let the witness testify.

Q. The lamp service, I should say?

A. These tests I made on the lamppost were not on the shell of the lamp; there was a pipe inside, which we were very careful to get at.

Q. You made your tests on the lamp service?

A. On the regular lamp service, on the pipe that feeds the lamps.

Q. Would they show the difference in potential, between the rail and main, as though you ran your wire down to the main itself?

A. Yes, sir.

Q. And the same in the case of the service?

A. And the same in the case of the service.

By Mr. Page:

Q. I understand you to say that according to your idea all of these red lines in the upper part of New York City come from the 135th Street overhead trolley?

A. This map?

Q. Yes, 301.

A. 1902?

Q. Yes. In 1902.

A. Yes. I don't know, I surmise it does, from the indications.

5759 Q. And you think that the red line running up Amsterdam Avenue is electrified from the 135th Street trolley?

A. Yes, sir.

Q. And you think running on down Amsterdam Avenue and the Boulevard on the west side down to practically 65th Street?

A. Something like that.

Q. Or 69th Street?

A. Yes.

Q. It comes from this overhead trolley on 135th Street?

A. It comes from the upper districts, yes.

Q. As an electrical expert, how do you figure that from the 135th Street here the lines on Second Avenue, Third Avenue and Lexington would be more heavily electrified than they would on Madison Avenue, which is in direct contact with it?

A. They all come from the Bronx, over the different bridges, and they are all tied in metal-ically there, and so are connected.

Q. Does that explain why Madison Avenue, which is in direct connection with the Bronx and with the 135th Street trolley line, should be less an area of danger than the avenues to the east?

A. No, not necessarily.

Q. I ask you as an electrical expert that knows all about this very difficult subject, to say why that is.

Mr. Mathewson: But it is not. You are quite turned around. It is not more heavily electrified over there, it is less; if you will look at the map you will see you have misread the figures by inadvertence.

Q. Let us go down here to 100th Street, and there it ends and you get a neutral pipe, and on the other avenues it runs clear down to Eighty-sixth Street, that is what I am referring to. I am getting to the red and green.

A. They follow the metallic structures down the different streets.

5760 Q. Well, the metallic structure here is the gas pipe, isn't it?

A. Well, it is the gas pipe and street railroad, it follows both. Where it is red it means there is more on the gas pipes than on the others. It shows a higher potential.

Q. Where there is red and green on each street, what does that mean; that there are two gas pipes, one having a positive and the other a negative potential?

A. No, that is the distinction between the elevated and surface. The smaller figures are the elevated and the heavier the surface, with reference to gas mains.

Q. Now we will take the avenue where we have—take Third Avenue. You have, I notice, a green line and a red line running down that same avenue?

A. Yes.

Q. What does the green line mean and the red mean?

A. In that case the green means the pipes are negative to the elevated and positive to the street railways.

Q. And the red means negative to the street railway and positive to the elevated?

A. The red means the gas mains are positive to the street railway in that case.

By the MASTER:

Q. You can read those colors in connection with the size of these figures, whether they are large or small?

A. Yes.

By Mr. MATHEWSON:

Q. Where they are parallel, running along together?

A. Yes, in the same street.

Q. Now, as a matter of fact the Bronx is operated by the overhead trolley generally, isn't it?

A. Yes.

5761 Q. And it is possible that currents may come down over the Third Avenue bridge as well as the Madison Avenue bridge?

A. Yes, over all the bridges, the steel structures.

Q. The 135th Street line is part of that general Bronx system, is it not?

A. Exactly.

Mr. MATHEWSON: That is all, so far as I am concerned.

JOHN W. LIEB, JR., called as a witness on behalf of the complainant, in rebuttal, being duly sworn, testified as follows:

Direct examination by Mr. MATHEWSON:

Q. Mr. Lieb, what position do you hold in connection with the New York Edison Company, if any?

A. I am the third Vice-President and Associate General Manager.

Q. What experience have you had in electrical business, electricity for lighting and kindred subjects; very briefly?

A. Beginning with 1880, I graduated from the Stevens Institute of Technology as a mechanical engineer and became connected with

Mr. Brush, of the Brush Electric Company in Cleveland; then went with the Edison Electric Light Company and was Mr. Edison's personal assistant in connection with experiments and the installation of the old Pearl Street station in New York City in 1882. I went abroad for ten or twelve years as the chief engineer and technical director of the Italian Edison Company, which I assisted in establishing, and I had charge of the construction, designing and operation of power plants of different kinds all over Italy. In 1894 I returned to the Edison Electric Illuminating Company and occupied various positions, as associate general manager, general manager and third vice-president and general manager of
5762 the Edison Electric Illuminating Company, and then third
vice-president and associate general manager of the New York Edison Company, the position I to-day occupy.

Q. Are you practically familiar with the testing of electric currents and their effect and the circumstances under which they may operate?

A. I am.

Q. I call your attention to Complainant's Exhibits 301 and 302, being the two maps which have been just put in evidence, and ask you whether between 1902, when the first map was made, and 1903, when the second map was made, there was any change in the stations or method of operation of the New York Edison Company that could account for the difference in potentials as shown on those maps?

A. No, sir.

Q. I will ask you to what you would attribute the red or danger area at the upper end of the city as shown on Exhibit 301?

A. I would attribute that—and I made tests to determine that, or had tests made under my direction to determine that fact—that the danger areas in the upper part of this city were due to the return currents that were flowing back from the upper part of Manhattan across the bridges and across the Harlem River back into the Bronx. I will say, in order to bring that matter out clearly, at my request the power house of the Metropolitan Street Railway Company, which was operating at the time, in the neighborhood of 140th Street and Lexington Avenue, was closed down completely for a period; so that the only current that was left in the upper part of the city was that which came directly over to operate the 135th Street line, and what was left then with this power house on Manhattan thrown out of service was practically a very narrow circle of influence, due directly to the return on 135th Street alone.

5763 Mr. PAGE: You said 140th Street and Lexington Avenue; you mean 140th Street and Lenox Avenue, don't you?

The WITNESS: I was not sure whether it was Lexington or Lenox. Make it Lenox, 146th and Lenox Ave.

Q. As to the danger area which was shown around the City Hall, to what would that be attributable in your opinion?

A. That is due very directly to the return currents which are going back to Brooklyn, some of them over the bridge and some of them into the earth, and through the East River back to the Borough of Brooklyn.

Q. Now, aside from your testimony that there was no change in the Edison Company between the dates when these two maps were prepared, which would account for their changed indications, was there anything, so far as you are aware, other than the electrification of the elevated railroad, which did account for the change in 1903, as shown by Exhibit 302, as compared with 1902, and by Exhibit 301?

A. There was not.

Q. Didn't you make it your business to keep familiar with the electrical conditions and changes in the Borough of Manhattan during that period?

A. That is part of my business, sir.

Q. It was suggested in the testimony of witnesses for the defendants that electrolytic conditions, if they existed, might be due to the current or method of operation of the Edison Electric Company. Aside from these comparisons that are made on these maps have you anything to say on that subject, briefly, whether in your judgment that is so?

Mr. Page: I remember, if the Master please, that most of those sug-estions were made in the questions of counsel, and my recollection was that Dr. Sever did not rise to the opportunity I gave 5764 him on that line, but if they wish to rebut the questions of counsel——

The Master: I do not recollect what his testimony was.

Mr. Mathewson: He brought that in specifically.

Mr. Page: Counsel did, I remember, but I had sort of a recollection that counsel was disappointed at the answer of the witness.

Q. I will merely ask you generally, if you will answer in a word, whether that could have been responsible for the condition?

A. In my judgment, and as the result of my experience and numerous tests made at my instigation and under my direction, it is my judgment that the neutral return wire of the Edison three-wire system in New York City has nothing to do with the electrolytic conditions in the Borough of Manhattan as shown by these maps.

Q. Would these maps indicate to you, as an expert, that the Edison system was having any effect in that direction?

A. These maps would not give me the necessary evidence to have a definite judgment on that.

Q. You speak from your own knowledge, outside of the maps?

A. I speak from, specific tests made at my request at different times, which were made for that specific purpose.

Cross-examination by Mr. Page:

Q. Now, you say that the electrolytic condition of New York City is in no way due to the Edison Company?

A. In no substantial way, no way that——

Q. That there are no stray currents?

Mr. MATHEWSON: Let us have the answer first.

5765 The WITNESS: In no substantial way that would affect what would be denominated as the electrolytic conditions which would be likely to produce electrolysis, or which would give rise to a dangerous difference of potentials.

Q. What precautions have you taken—or have you taken precautions from time to time against electrolytic action?

A. Every precaution known to the state of the art.

Q. And have those been from time to time?

A. Continually.

By the MASTER:

Q. I think the Senator would prefer to have you describe them. I would be glad to have you do it.

By Mr. PAGE:

Q. Yes, and state when you first took the precaution and what you did from time to time.

A. It may be necessary for me to go a little far afield. As has been brought out here, the original Edison system installed in New York City here was what was known as the two-wire system; that was installed in 1882 and 1883. After that system had been in operation several years the three-wire system was invented by Mr. Edison, and subsequent installations in New York City and America generally, and abroad, were made by the three-wire system. The two-wire system in the lower part of New York City was kept operative for a long number of years. Parts of that system were still in operation only three, four or five years ago. On the introduction of the Edison three-wire system it was, as a general rule, operated without specific grounding, as it is called, of the neutral. Each outgoing feeder from the operating power houses and all of 5766 the mains and services were operated with three wires. In the case of the mains and services these three wires were of the same conductivity; in the case of the feeders the outgoing and the return wires were of greater cross section than the return, each feeder carried directly back from the system and from the nucleus of main where it was attached, carried back the return wire, directly back into the power house. The purpose of the neutral wire was to take care of any unbalancing that there might be between the currents carried by the two legs or branches of the system. The extent to which that unbalancing takes place depends upon the subdivision of the installation itself in the houses and of the number of customers that might be connected to one of the other leg or branch of the three-wire system.

In New York City that subdivision is carried out so fine, it is carried out to such an extent, that unbalancing does hardly exist. I know of no place where the translating devices used on the system are to such a large extent connected to the outside wires, and therefore, have nothing to do with the neutral. The neutral in New York City is substantially a return only for lighting circuits, and for 110-volt translating devices. So that the subdivision is so fine that the neutral carries an insignificant amount of current. The amount of copper which is provided naturally by the type of construction which I have explained is such that the cross section of copper which is provided for the insignificant amount of current that comes back over that neutral wire is many hundred times the amount of copper which is provided for the outside legs.

Later, it became the practice of companies operating the three-wire system to so call ground the neutral. The grounding of the neutral in the Edison three-wire system has nothing whatever to do with providing a by-path or any kind of a path for the current
5767 through the ground to come back to the Edison station. The grounding of the neutral is merely a precautionary measure. At first that precautionary measure was not recognized by the Board of Fire Underwriters and electrical rules generally, but as experience has been extended, the wisdom of grounding the neutral has been so far demonstrated, also from the standpoint of the insurance authorities, that the grounding of the neutral is not only permissible but is in many conditions rendered obligatory. The Edison three-wire system, as it is in New York, has been and can be and could to-day within twenty-four hours' notice be rendered absolutely independent of the ground; that would not affect the operation of the system in any way in the slightest. The grounding of the neutral is merely there is a precautionary measure in case there should develop a very serious short circuit generally on the system, which might bring the neutral wire and the outside wire on one side at the same potential and bring, therefore, between the middle wire and the remaining outside wire the full potential of the system, double what it is normally intended for, and produce in such a contingency serious results.

With the change which took place in 1894 or 1895 in New York City in the substitution of cables for the Edison three-wire system, a change took place, and instead of using for the Edison feeder system conductors with three wires, the main feeders consisted of two wires only, and the neutral was brought back to the station independently. That resulted in the development of what is known as the tree neutral, which is a system of return conductors that is independent of the outside wires and is more efficient. It enables any local unbalancing, if such there be, any minimum amount of it, to be compensated for locally without running back to
5768 the station and out again; and pursuing the same course of very large copper sections for the Edison neutral, which was the practice when the tubes were used, with three-wire conductors, there is to-day in New York City a neutral provided for each and every substation which is immensely, as I said before, many hundred times larger that the outside conductor for the purpose of carrying back to the station the infinitesimal amounts of current that comes back over the neutral conductors. We have a direct measure of that in so far as our machinery generally does not send current into the neutral at all. Our machinery has its terminals on the outside wire, and we have small balancers set in the stations of comparatively insignificant capacity as compared with the generating station that take care of that small amount of neutral current. The amount

of current that is sent back and forth over that neutral is, therefore, a matter of daily registration and accounting, and it is absolutely insignificant. That is the story.

Q. Now, let us see if we can get this. You say in 1883 was the first installation of Edison lighting in New York City, and that was the two-wire system?

A. September, 1882, the first general distribution of current for lighting power by underground conductors.

Q. And for a number of years that was a two-wire system?

A. Yes, for quite a number of years.

Q. Then, when you say that an independent third-wire return was abondoned for some different system in 1894, you are mistaken on your second date, are you not?

A. No, I said that the Edison three-wire tube system, the two Edison tubes were no longer used generally after 1894, and the cable conductors were used instead of Edison tubes, was my statement.

5769 Q. When was the three-wire system generally installed?

A. Well, in New York City——

Q. Take it particularly in the lower portion of this city.

A. I think the installation—I was not here at the time, so I can only speak generally as to the conditions here—I should think that so far as I know, the third wire system began to be generally used between possibly 1885, 1887 and 1890. My memory does not serve me quite correctly as to the exact date. I know I installed it in Milan, Italy, in connection with the Edison Lighting system there in 1886 or 1887.

Q. Do you remember when it was that the Board of Fire Underwriters of this city required all buildings to be rewired with the Edison three-wire system rather than with the two?

A. I was not here at that time.

Q. Was — not within the last four or five years?

A. That is not within the time of my connection with the New York Edison Company, sir.

Q. Well, do you mean that the last four of five years was not, or the time it was required was not?

A. Any questions that have existed as regards the Edison three-wire system and the Board of Fire Underwriters, to my knowledge, obtained between 1882 and 1893, while I was abroad; not since my return in 1894.

Q. Now, is the present practice to ground the neutral wire or any portion of it?

A. Absolutely, some places even by absolutely bare neutral conductors without any insulation whatever. It is absolutely the only safe and proper practice in the case of a three-wire system.

Q. And I understand that the amount of current that gets back to the station over these wires is an infinitesimal quantity?

5770 A. It is, where the subdivision of the power or lighting units, as is the case in New York City, where almost——

Q. We do not care for all that explanation over again.

A. Well, that is the reason for it. The——

Q. Yet the fact is, that over these grounded wires or whatever you call them, very little current goes back to the station?

A. Peculiarly so in New York City.

Q. Now, you say there might be a serious short-circuiting, and it is for that purpose that you have this wire grounded. Now, if this serious short-circuiting should occur, would it create a dangerous difference of potentiality on the subsurface structures?

A. It could not under present conditions. The results would be entirely different than what they would if the neutral were not grounded. In other words I——

Q. Well, would that throw your neutrals out of balance?

A. If there were a short circuit on one side of the system, decidedly so in such a contingency, and it is only for that contingency that the neutral is grounded.

Q. Now, I judge from these many changes that you have spoken of in your seeking to establish a return system, that you have given considerable attention to the gathering up of your stray currents and bringing them back home, is that right?

A. It is my business to be posted and familiarize myself with anything that has to do with the operation of our system.

Q. And you think that now you have got that pretty well perfected, so that most of the current that goes out from the Edison Company is brought back to the power house over your own return circuit?

A. I think that that has always been so, and now more so than ever.

Q. And that has been the purpose of electrical engineers operating any system?

5771 Mr. MATHEWSON: How does he know what the purpose is?

The WITNESS: The purpose of electrical engineering is to obtain the results desired in the best possible way at the lowest possible expense.

Q. And all this current wandering around over the inside and over the gas pipes represents just that much loss to the company that originated the current, does it not?

A. Not necessarily, that is not necessarily a question of loss.

Q. Well, when the current strays off in this way don't you lose?

A. No, I would like to explain that by a case. If there was a system necessary to return current from Harlem down to the Battery, and you had suppositionally only a very small wire, if you could allow other conducting mediums to participate in carrying that current back from Harlem to the Battery, it would be a distinct source of saving and not of loss.

Mr. MATHEWSON: Say, a gas pipe?

The WITNESS: Any convenient thing that might serve as a conducting medium.

By Mr. PAGE:

Q. Is that why you put in a neutral of such large cross-sections, that it would gather up these stray currents of other people and bring them back to you?

A. No, to make sure that all of ours were safely carried back.

Q. Every competent electrical engineer would try to carry back his own current, wouldn't he?

A. Well, he might make an effort in that direction, but the problem is not in all cases quite as simple a one as it is in the case of the Edison three-wire system. For instance, in the case of an overhead trolley system the problem is a very much more difficult one. 5772

Q. And that is the most difficult probably, the overhead trolley, is it not?

A. Yes, that is one of the problems.

Mr. Page: I think that is all.

Cross-examination by Mr. Burr:

Q. In other words, you claim that although there may be other stray currents, these stray currents do not belong to you?

A. No, sir, they do not. I make that statement emphatically.

Q. And was it for the purpose of ascertaining the existence of any of these stray currents that you had those examinations made by Mr. Valey in 1902 and 1903?

A. The purpose of that examination was to obtain information for myself and the company as to the general underground conditions obtaining in New York City, the potentials which were developed with different substructures, and to inform myself of their different stages and development as other elements by stages became operative.

Q. Well, your investigation was particularly addressed as to the effects of any wandering current belonging to you from the gas mains, wasn't it?

A. Not alone, sir, they were also addressed toward the conditions which might obtain as to other structures, subsurface structures, and elements other than gas pipes.

Redirect examination by Mr. Mathewson:

Q. If you found currents flowing back to a station producing electricity, those being discovered by tests as to the direction of the current and the points to which they were tending, would that indicate where those currents originated or from what source they came?

A. Well, such stray currents as would come back right directly, and could be traceable right directly to a power station or a substation, would indicate that there was a condition at that power station which was responsible for that returning. 5773

Q. Or if the current and its direction was taken at the structure which carried the current?

A. Yes.

Alexander Maxwell, called as a witness on behalf of the complainant, in rebuttal, being duly sworn, testified as follows:

Direct examination by Mr. Mathewson:

Q. Mr. Maxwell, what is your business?

A. Electrical engineer.

Q. Connected with what concern?

A. The New York Edison Company.

Q. Did you make last April a map of a certain portion of the city north of Canal Street, running along the North River up as far as West 4th Street and east to Broadway, showing currents of electricity at various points with their intensity and direction?

A. Yes.

Q. Is this the map (handing paper)?

A. Yes, sir.

Mr. PAGE: What is this proposed to rebut?

Mr. MATHEWSON: Professor Sever testified as to the bonding of the elevated railway, etc., so that no current which could do harm could escape, he thought, from the elevated railway.

Mr. PAGE: When that system was completed?

Mr. MATHEWSON: No, as it is now. He described the bonding, how it was done. I propose to show, or will endeavor to show briefly, that he was mistaken, that it is escaping and doing exactly what he says it could not do.

5774 Mr. PAGE: Professor Sever's testimony was as to a complete system of bonding on the subway, and that they had commenced to establish that on the elevated, and when it was completed there would be no escape.

Mr. MATHEWSON: I remember distinctly he testified as to the elevated and how it was bonded and protected.

Mr. PAGE: On page 3912, referring to the elevated road, "it is my opinion that with the construction that has been cited and with the additional construction now so successfully employed in the subway the difficulty, if any, from the elevated stray currents will be practically, if not almost entirely, done away with."

The MASTER: I do not know what is intended to be shown by this witness, but assuming that Mr. Mathewson intends to show the result of certain observations as to existing conditions, would you not consider that to be proper rebuttal of the expressions of the expert, Mr. Sever, to the contrary? Mr. Sever testified in his opinion that certain things would result, and if he puts a witness on the stand who has made certain specific observations to the contrary, would that not be rebuttal?

Mr. PAGE: This examination has not been made since the testimony?

Mr. MATHEWSON: That is a single page. If you read the record there you will see that his testimony was to minimize any effect from the currents from the elevated road. There is no doubt about it at all. I am directing this, and the following testimony, directly to that point. It is not any general testimony.

The MASTER: I am disposed to overrule the objection. I may be wrong without the record before me.

5775 Mr. PAGE: Well, I will take an exception. I suppose the objection that I have made that this is not proper rebuttal and that they testified on their direct case and brought up this question of the present condition of electrolysis, and the necessity of their having a large reserve because of the depreciation occasioned by it—

it seems to me they had all these investigations and they should have put in this testimony at that time, and they are no part of their case in rebuttal.

Mr. **Mathewson**: We are rebutting specific testimony of your witnesses as to specific structures.

The **Master**: I will allow it.

Mr. **Page**: Exception.

Q. What does this map show, Mr. Maxwell?

A. The direction and magnitude of current flowing on lead cable sheaths.

Q. Along the line of the elevated railway?

A. Yes, sir.

Q. As shown on this map marked elevated railway?

A. Yes.

Q. And did you test those currents to see to what point they were returning?

A. Yes, sir.

Q. And do these dotted lines along here so indicate?

A. No, sir; the arrow indicates.

Q. The arrow indicates?

A. Yes, sir.

Q. What was the direction of the current coming from this line along the elevated?

A. Towards the Spring Street substation of the elevated road.

Q. Did you trace it along to that point?

A. Yes, sir.

Q. Are there any other structures, or figures or letters that do not explain themselves on that map which you wish to explain?

5776 A. I think not, except that this dotted line here is the negative feeder from the substation to the west side elevated, that is about all.

By Mr. **Burr**:

Q. What street does that dotted line run through?

A. That is Spring Street.

Mr. **Mathewson**: I offer it in evidence.

By Mr. **Burr**:

Q. When was that map made?

Mr. **Mathewson**: In April, 1906.

Mr. **Page**: I want the Master to bear in mind that date, because this is admitted, I presume, on the assumption that it contradicts the prophecy of Mr. Sever, which has been made this winter.

Mr. **Mathewson**: And Mr. Marks' testimony, that there was no such thing as electrolysis which came from the elevated, etc.

Paper received and marked Complainant's Exhibit 303.

By Mr. **Mathewson**:

Q. Now, did you, in July, 1906, examine, lay bare and take up certain lengths of gas service pipe close to the pillars of the elevated railway within the section indicated by this map?

A. Yes, sir.

Mr. PAGE: This is objected to. Certainly we have not brought any gas pipes in here.

Mr. MATHEWSON: We do not have to proceed exactly along the tangible line; we can produce evidence that is competent.

Mr. PAGE: As I understand it, in the direct case they have got to produce whatever evidence they have. They cannot put a 5777 man on the stand and say there is such a thing as electrolysis, and then come along afterwards and put in all the evidence they had in their possession at the time.

The MASTER: You need not argue to me that it is the business of the complainant to exhaust his case when he presents it. The only thing is, it seems to me, so far as I can now judge and according to my best recollection of the testimony, that there were some new suggestions brought out in your case about the relations of the elevated road to some of these other structures and this question of electrolysis, and it seems to me, as I now recall, that this is proper rebuttal.

Mr. PAGE: Mr. Simpson testified distinctly as to certain places along the elevated road that he discovered this electrolysis.

Mr. MATHEWSON: Under the Brooklyn Bridge?

Mr. BURR: Two instances, one on Church Street and the Brooklyn Bridge.

Mr. MATHEWSON: Due to the Brooklyn Bridge?

Mr. PAGE: No, due to the elevated railroad.

Mr. BURR: And we met that contention by whatever testimony we could offer. Now, this opening up the whole subject of electrolysis is what they should have done in the beginning.

Mr. MATHEWSON: I do not want to argue it at length, but it seems to me so clearly in rebuttal where you bring evidence trying to negative different propositions as responsible for the electrolysis, like the Subway, it could not do it; the elevated, no, nothing serious could happen from it; and Mr. Marks' testimony to the same effect 5778 if we can show that that particular elevated is doing damage, not the general proposition that there is electrolysis, but this particular testimony, it is competent.

Mr. PAGE: That is what you are bringing in now, bringing in your pipe to show that.

Mr. MATHEWSON: No, at this particular place.

Mr. PAGE: They produced a witness who knew very little, and they opened it up and left it, and if they had the witnesses who knew more they should have exhausted their case on a subject which they opened up themselves, and not have reserved the principal part of their case for rebuttal when they claim we shall not rebut their rebuttal testimony.

Mr. MATHEWSON: We did not know you were going to discriminate and say it did not come from the elevated. This shows that the testimony your witnesses gave was utterly incorrect, and it undermines the value of all his conclusions.

Mr. Burr: Objected to as incompetent, irrelevant and immaterial and not proper rebuttal.

The Master: Objection overruled.

Exception to the defendant.

Q. And have you those pieces of pipe in court?

A. Yes, sir.

Q. Now, the first one to which I call your attention is the one taken up at 432 West Broadway. Did you take up a pipe there?

A. Yes.

Q. Was that a one and one-quarter inch gas service pipe?

A. Yes, sir.

Q. Will you produce that?

A. That is the pipe (producing pipe).

Q. Are there pittings in that pipe?

A. Yes, sir, these and a number of other lighter pits (indicating).

5779 Mr. Mathewson: I ask that that be marked as an exhibit?

Mr. Burr: I object to this being received in evidence because the testimony already in this case is that pitting may be due to other causes than electrolysis.

Mr. Mathewson: That we will show, if you will give us a chance.

Mr. Burr: You are showing some pittings and you want to show that those are due to electrolysis and nothing else, before it will be proper.

Objection overruled. Exception.

Pipe received in evidence and marked Complainant's Exhibit 304.

Q. Have you indicated by a drawing the location of that pipe as related to the elevated pillars, with the distances?

A. Yes.

Q. Is Fig. 1 that drawing?

A. That is Fig. 1 in this blue-print.

Q. And did you check the measurements so that you know they are correct?

A. Yes.

Q. Those were marked under your supervision, taken up, and then the measurements that were made by you were under your direction transcribed to this Fig. 1, were they?

A. Yes.

Q. So does that accurately indicate the situation?

A. Accurately, yes, sir.

Mr. Mathewson: I offer it in evidence.

Mr. Burr: I make the same objection to that.

Objection overruled. Exception.

Paper marked Complainant's Exhibit 305.

Q. Fig 1 shows the location of this pipe and electrical readings, is that so?

A. Yes.

5780 Q. Is this true with each other drawing which you present in regard to each of these other pipes you have referred to?

A. Yes, there is a drawing to cover each of the samples of pipe.

Q. Did you also take up a three-inch gas service at 476 West Broadway?

A. Yes, sir.

Q. Are there pittings on that?

A. Yes.

Q. Will you produce that?

A. Yes (producing pipe).

Q. Will you show us the pittings in that pipe?

A. There, and there, and there (indicating). Those are the pittings in that pipe.

Q. The pipe just previously shown was pitted through, do you remember?

A. That one, I think, has a hold in it. I don't remember at the moment but my impression is that it has.

Q. Is this pitted through, that you have, or merely pitted into the metal?

A. It is merely pitted into the metal. I do not think it is through in any place.

Mr. MATHEWSON: I offer that in evidence.

Same objection. Same ruling.

Exception.

Pipe received in evidence and marked Complainant's Exhibit 306.

Q. And this Figure II., which I show you, represents the same matter in reference to the location?

A. The electrical and location measurements both for this exhibit.

Mr. MATHEWSON: I offer that in evidence.

Mr. BURR: Same objection.

The MASTER: Same ruling.

Exception.

Paper marked Complainant's Exhibit 307.

Mr. MATHEWSON: I understand you have the same objection to all of this testimony?

The MASTER: Yes.

5781 Q. Did you also remove a one and one-half inch service pipe from 454 West Broadway?

A. Yes.

Q. Will you produce that?

A. Yes.

(Producing pipe.)

Q. That is pitted in some places through the pipe?

A. No, sir, that is not through, but it is very deeply scored.

Q. Wait a moment, I have a memorandum that it is. Just see if the pipe or fitting is not pitted through in some spot or spots?

A. Very nearly through in a number of places. I do not find that it is clear through anywhere, no sir.

Mr. MATHEWSON: I offer that in evidence.

Same objection and ruling.

Exception.

Pipe marked Exhibits 308-A and 308-B.

Q. Is figure III the figure showing the electrical and location measurements in regard to that pipe?
A. Yes, sir, the same as in the previous cases.

Mr. Mathewson: Now, I offer that in evidence.
Same objection and ruling.
Exception.
Paper marked Complainant's Exhibit 309.

Q. Did you also remove a nipple and coupling from a two-inch service from 414 West Broadway, which shows deep pitting?
A. Yes.

(Producing pipe.)
Mr. Mathewson: I offer that in evidence, also the corresponding drawing.
Same objection and ruling.
Exception.
Pipe received in evidence and marked Complainant's Exhibit 310.
5782 Drawing received in evidence and marked Complainant's Exhibit 311.

Q. Did you also remove an inch and a quarter service pipe at 448 West Broadway, and if so, produce it?
A. Yes, sir.

(Producing pipe.)

Q. This shows a hole pitted entirely through, does it not?
A. Yes, sir, clear through the wall of the pipe.

Mr. Mathewson: I offer it in evidence.
Same objection and ruling.
Exception.
Pipe received in evidence and marked Complainant's Exhibit 312.

Q. Figure V gives the same measurements for this pipe?
A. Yes.

Mr. Mathewson: I offer it in evidence.
Same objection and ruling.
Exception.
Paper received in evidence and marked Complainant's Exhibit No. 313.

Q. Did you also remove an inch and a half service 454 West Broadway?
A. Yes, sir.
Q. Produce that please?

(Witness produces pipe.)

A. This included a fitting.
Q. That shows pitting?
A. Yes, sir.
Q. In various places, does it not?

A. Pretty generally all over the whole length of the pipe.

Mr. Mathewson: I offer that in evidence together with the accompanying drawing.

5783 Mr. Burr:
Same ruling.
Exception.
Pipe marked Complainant's Exhibit 314.
Drawing marked Complainant' Exhibit 315.

Q. Did you take a 2½-inch valve and fittings from the gas pipe at 476 West Broadway?
A. Yes, sir.
Q. Will you produce that please?
A. That is No. 7, I think.
Q. Yes.

The pipe is produced.
Mr. Mathewson: I offer that in evidence.
The Witness: This is the service from 476 West Broadway.
Received in evidence and marked Complainant's Exhibit 316A and 316B.
Mr. Page: Wasn't Exhibit 306 from 476 West Broadway?
Mr. Mathewson: Yes. This is some more.

Q. Then this last exhibit appears on the second sketch (Exhibit 307)?
A. Sketch 2; yes, sir.
Q. Did you also take a one-inch gas service from 496 West Broadway?
A. Yes, sir.
Q. Produce that please?
A. This is the one inch service from 496 West Broadway (producing same).
Q. Does that show pitting entirely through the pipe?
A. Yes, sir. There is a hole in it in one place.
Q. And is the location and measure of that shown on this figure 7?
A. Shown in figure 7; yes, sir.

Mr. Mathewson: I offer that in evidence.
Received in evidence and marked (pipe) Complainant's Exhibit 317, and (drawing) Complainant's Exhibit 318.

5784 Q. And this appears on F-gure 7, does it?
A. Yes, sir.
Q. Have you also a one-inch gas service which you took from 496 West Broadway, a further one?
A. Yes, sir.

At 5 p. m. adjourned to Saturday, January 19th, 1907, at 11 a. m.

Last Exhibits:

Complainant's, 318.
State's, 000.
City's, 236.

5785 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *January 19th,* 1907—11:00 a. m.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Page, Mr. Kirby.

5786 JOHN W. LIEB, JR., recalled for further examination.

Cross-examination by Mr. BURR:

Q. Do I understand you correctly to say and to mean that stray currents from your wires can be accurately located, and were accurately located as a result of the examination made by Mr. Varely in 1902 and 1903?

A. I stated that we had made careful tests to locate and to measure differences of potential in all parts of our system, with a view to learning what the electrolytic conditions might be as affected by the grounding of our neutrals in our feeder junction boxes. That was my statement.

Q. And I understood you to say, as a result of that examination, that you had no wandering currents?

A. Not of any significance, no sir.

Q. So that if there was any damage, in other words, due by reason of wandering currents to the mains of this gas company, or to any other gas company, it could not be attributed to you?

A. Yes, sir.

Q. That is the point?

A. That is my statement, yes sir.

Q. And I further understood you to say that in your opinion those wandering currents which may or may not cause damage to the mains were currents belonging to other companies, the subway company and the L structure, and currents which came across and affected the northern part of the city, coming over from the Bronx?

A. I made that statement, excepting in reference to the subway; I don't think I referred to the Rapid Transit subway in any way.

Q. In other words, in order to make it clearer, speaking now to you as an electrical authority, is it possible to locate the currents which affect the mains in the streets of the city?

A. Not in all cases directly. We located in these surveys, 5787 making a survey first under one set of conditions, then a variable condition came into effect, to wit, the operation of the elevated railroad, their electrification; then we made another survey showing a changed condition of affairs, a kind of "before and after using" test, and, therefore, it is logical, other conditions having remained the same, to attribute the changed conditions to the new factor which had come in. In others of our surveys which have been referred to and which will probably be referred to in detail later, we were able to make a very direct, exact and local designation of where the currents came from and where they went to.

Q. Now give me the particulars of that, as that is what I wanted to clear up?

A. In examining the electrolytic surveys that have been presented in evidence, and still others that were made, we were led to believe that among the points where destructive electrolysis was likely to be at work, and the points at which the conditions for such electrolytic destruction were favorable, was, among others, the neighborhood of Spring Street and West Broadway. We were led to that conclusion——

Q. Was that because of the presence of the elevated structure at that point?

A. It is because of the presence immediately near there of a substation of the elevated railroad, which sent its current on the elevated structure, and in conjunction with the elevated structure itself. We were led to this conclusion not only by the potential tests that have been referred to but also by the fact that we actually found the lead covered cables of the New York Edison Company carrying consid-r-able currents. Therefore under my instructions our people were instructed to at once inspect the lead cables of the New York Edison Company and the sub-surface structures immediately in front 5788 of the sub-station of the Manhattan——

Q. What do you mean by the Manhattan.

A. The Manhattan Elevated Railroad.

By Mr. Mathewson:

Q. What station?

A. Near Spring Street and Broadway—West Broadway.

Q. You can refer it to anything you have here, if you wish (witness consults a blue print).

Senator Page: What exhibit is this?

Mr. Mathewson: Complainant's Exhibit 303.

The Witess: They at once investigated the Edison lead covered cables that ran along in front of that station, and they found this condition of affairs as found by this Exhibit.

Mr. Mathewson: Do not call it an exhibit—this pipe.

The Witness: Well, this pipe. This is a piece of a high tension conductor of the New York Edison Company's system, and shows here (indicating) a very characteristic pitting which was to be recognized at once as electrolytic in its character——

Mr. Burr: I object to the characterization.

Mr. Mathewson: This man is an expert. You have asked him a question.

Mr. Burr: I have not asked him to characterize the symptoms or things which he sees on that pipe. I am asking—in fact, I think Mr. Lieb is going a little beyond what I have asked him. I have not asked him with regard to what conditions you find that pipe to have and to present at this moment. The point I have tried to clear up is whether it is possible for you, representing the Edison Com-
5789 pany, having shown to your own satisfaction at least that your wandering currents do not affect the gas mains, whether it is possible for someone on behalf of the Consolidated Gas Company, equally capable with you, to locate the wandering currents, which they claim affect their mains.

The Witness: I am coming right to that in one moment. I am leading up to show how we were able to locate them, and show you physically the process of location. Here we found a perforation which ruined this piece of cable and, therefore, it was cut loose——

Mr. Mathewson: Will you show that to the Master, the perforation on this lead?

The Witness: That is a high conductor cable (showing pipe to the Master), and it is very heavily insulated with paper insulation. It carries 6,600 volts. Alongside of it there was another which also is in this same category. Now, this cable was located in this position in reference to the power house. The power house was immediately right in front of this place——

Mr. Mathewson: The centre of the pipe.

By Mr. Burr:

Q. That is, the Manhattan power house was directly in front of this pipe?

A. In the street, yes, sir; and the current that was running and traveling on this lead cable was found to be coming down this lead cable to this point——

By Mr. Mathewson:

Q. That is, the middle of the pipe?

A. Yes. The current came down the lead pipe to the point
5790 indicated by the major electrolytic pitting, when it left the pipe to go into the elevated railway power house, and there was no current flowing beyond that.

Q. Now, just show the pitting from one end to the other where the current was flowing, and this end being perfectly smooth?

A. This is where the current came down and here is where it left the pipe to go into the power house (illustrating and indicating). Beyond this by measurements there were no currents found to be flowing in the lead pipe (indicating point of major pitting).

By Mr. Burr:

Q. So that made it certain in your mind that the current which affected that pipe came from the substation of the Manhattan L?

A. Yes, sir.

Q. And can these wandering currents be controlled?

A. Within limit.

Q. Are they not being controlled to-day by the Manhattan L?

A. No, sir.

Q. Are they not installing a system to control the wandering currents on the Manhattan L?

A. I understand that changes and improvements are now in progress of being done with that end in view.

Q. But from an inspection made by you on behalf of your company you can easily locate the wandering currents that were affecting your mains or pipes or conduits?

A. I could very easily make tests so as to determine if any such conditions obtained and if they were due to our system.

Q. Or if the pitting effects which you have described here on your pipes were caused by anybody else you could locate those other currents belonging to other companies?

A. Yes, within certain limits, of course. That is owing to the fact that we can in any given section remove our—what we might call intentional connections to ground and render our system entirely isolated, which——

5791 Q. And that would be true equally as well with regard to the northern part of the Borough of Manhattan as with regard to the southern part?

A. Yes, but it is not possible with some of the other systems, so that their localization is rather more difficult.

Q. But if you wanted to know where the damage was coming from to your pipes you could locate from whence that damage arose or where it came from?

A. Yes.

Q. Now, with regard to Mr. Maxwell, Mr. Maxwell has been in your employ for some years?

A. Yes.

Q. The reason I call your attention to it is, in reading over the testimony of Mr. Simpson I see that Mr. Maxwell is the man to whom Mr. Simpson called attention in the two instances of Spring and Church Streets, and at the Brooklyn Bridge in the two pittings of which he spoke in his direct examination, so I suppose that is the same Mr. Maxwell who was consulted in that regard?

A. I suppose so, because Mr. Maxwell is in charge of our Testing Department, and I sent him to Mr. Simpson to confer with him relative to the opening of the street for the purpose of these investigations.

Q. So that whatever knowledge Mr. Maxwell has now with regard to this matter, Mr. Simpson had at the time he testified?

Mr. Mathewson: How does he know that?

Mr. Burr: He knows I don't want him to tell the impossible. I do not assume he is a mindreader.

Mr. Mathewson: Well, exactly.

Q. Do you know whether Mr. Simpson has that information which Mr. Maxwell procured from the examination of these pipes?

A. I have reason to assume a lot of it he didn't know anything about.

5792 Q. Do you know whether Mr. Simpson knew of the examination made by Mr. Varely in 1902 and 1903?

A. Oh, yes, he knew that that work was under way.

By Mr. Page:

Q. The pitting by electrolysis is occasioned by the current leaving the pipe or conductor?

A. Yes.

Q. And not by it entering it?

A. No, sir.

Q. On West Broadway you have these lead sheathed cables?

A. Yes, sir.

Q. Running the full length of it?

A. Yes, sir.

Q. And the currents that travel along down West Broadway to the power house at Spring Street would leave the cable at the power house?

A. Yes.

Q. And would enter the cable or get from the cable if it came from the elevated structure along the line above that?

A. I did not quite catch that.

Q. I say if it came from the elevated structure it would enter the point——

A. At some point above, that is very true.

Q. So lead is a much better conductor of electric current than iron, is it not?

A. I am quite sure in my mind as to the relative conductivity of lead and iron. Copper of course is very much better than either. Off-hand I think—well, I am not sure. I am not sure enough to make a statement as to that, which has the better conductivity of the two. That is a well known physical fact, that——

Q. What is?

A. That each has a definitely assigned conductivity, and any text book or reference book which shows what it is, what the relative conductivities are. I haven't in mine exactly their relations in the scale of conductivity. I can answer that question right offhand by asking one of our people, if you will permit me to, if you wish to get that information.

5793 Q. It is just as you prefer, Mr. Lieb.

The Witness: Professor?

Mr. Gans: Lead is about 9 and iron from 10 to 15.

Q. Now, interpreted in to English that means what?

A. That the conductivity—the resistance—I will have to ask the Professor whether he means in that statement the relative resistance.

Mr. Gans: Yes, or reversely, conductivity; the question was of resistance.

The Witness: That if the resistance of a given length of iron pipe were 9 or 10, the resistance of a given length of the same section of lead would be 10 to 12 or 13.

Q. I think you have that just reversed. Professor Gans says lead is about 9 and iron from 10 to 15.

Mr. **Gans**: Copper being 100.

The **Witness**: Then the conductivity of lead, 10 to 12 per cent. more than the same section of iron.

Q. And where there are two mediums of conductivity, the electricity follows the line of least resistance, does it not?

A. Yes, sir, generally.

Q. And would go on the lead in preference to the iron if they were in the same street?

A. Yes, and if both had the same cross sections of conducting medium, yes.

Q. What do you mean by cross section of conducting medium, do you mean the thickness of the pipe?

A. Yes, sir.

Q. For instance, thickness of the iron pipe as compared with the lead pipe?

A. Yes. If iron were the poorer conductor, if there happened to be more of it, of course it might overbalance its lesser conductivity.

5794 By Mr. **Mathewson**:

Q. Referring to the improvements which are in process on the elevated, and to which Professor Sever also referred, I will ask you whether in your judgment those improvements will insulate the elevated structure so that currents will not escape to the street?

A. I anticipate that they will result in an improvement of the conditions.

Q. Yes, that is not the question quite; whether it will insulate the structure so that some current will not escape to the street?

A. There may still be some; that is a question to be verified by further tests after the changes have been made.

Q. Referring to these lead pipes, which you have produced, could the pitting, as indicated there, possibly be due to the Edison current which is carried within the pipe as insulated?

A. No, sir.

Q. And referring to the charts introduced by Mr. Maxwell and to which you referred, what is there in those charts or the measurements or figures which indicates that the current comes from the elevated (handing paper)?

A. There are a number of indications here on Complainant's Exhibit 303, notably, which show the facts that all of the current in this section——

By Mr. **Burr**:

Q. What section is that?

A. Well, around about the Manhattan sub-station (indicating).

Q. When you show with your hands making a circle, describe the areas you desire to embrace?

A. Well, practically the area covered by the map.

Q. Complainant's Exhibit 303?

A. Yes. All of this map. The arrows indicate that in the territory covered by the map all of the currents are coming and tending

towards the elevated railroad substation, as you see here (in-
5795 dicating). You see all these arrows are coming in here, this goes up and this goes down, and this goes in this direction, and this goes in that direction, and this you see comes here and this here (indicating) they are all tending to return to the sub-station.

Q. The elevated sub-station?

A. Yes. And a similar condition of affairs i*n* indicated by these other charts.

By Mr. **Mathewson**:

Q. In reference to the different conductivity of lead or iron, Ohm's law, I think it is, is it not, states that a current will not all follow the line of greatest conductivity but that it will divide up among different conductors inversely in proportion to their conductivity?

A. That is true.

Q. Or in direct proportion to their conductivity?

A. That is true.

Q. And so even if there were both lead and iron of the same diameter each would carry a current in proportion to its conductivity?

A. Yes.

By Mr. **Burr**:

Q. Have you a sample of this soil from which the two pipes were taken which you have just had in your hand, those lead pipes, or can you tell the kind of soil they reposed in?

A. If my memory served me right, there were samples of that soil taken; I believe also that it was subjected to analysis.

By Mr. **Mathewson**:

Q. You have not it here?

A. No, sir; I have only a vague recollection of the circumstances.

By Mr. **Burr**:

Q. You did not take those up yourself I understand?

A. I did not.

5796 Q. So that you cannot say yourself as to where the exact location was that these pipes were taken.

Mr. **Mathewson**: I have some one who can.

A. I was not present when these were removed, no, sir.

By Mr. **Page**:

Q. Your answer to Mr. Mathewson's question that where there are two conductors of different conductivity, that the current will divide up, supposes, does it not, that both conductors are continuous?

A. Certainly.

Q. And not broken by joints?

A. Certainly.

Q. And if there is a continuous conductor that would be of greater conductivity, that is continuous, and another conductor of less conductivity that is broken by joints, the condition would be different?

A. Yes, that would bear on the effect of the general expression of their conductivity as a whole.

By Mr. Mathewson:

Q. If the joints were conductors also that would not make any difference, that would be like a continuous sheath?

A. No, if the joints were ample in section and material, the joints might be as good a conductor as the body of the pipe.

Q. Mr. Burr interrupted you just as you were about to say what those pittings were on the lead pipe; that is to say, to what action they were due. Can you from your experience and knowledge of the electrical business say whether those pittings are due to electrolytic action or something else?

A. In my judgment they bear all the earmarks of electrolytic decomposition.

By Mr. Burr:

5797 Q. I would rather that you should ask that question than that I should, but, having answered it, I want to ask about that. What leads you to believe that that is entirely or substantially due to electrolytic condition?

A. Well, my general experience, we having seen very many cases, we having seen the effects of actually passing current through lead conductors and seeing their effect and comparing them with the effects which were produced by ordinary depreciation due to subsoil conditions alone.

Q. Well, what do you mean exactly by pittings?

A. I mean the removal of the material in spots, giving it the appearance of being eaten out, not uniformly.

Q. Have you ever had any experience with gas mains at all?

A. Not excepting the seeing of the effect of both electrolytic decomposition and subsoil condition alone in iron pipes as they are laid in the ground, and——

Q. Are you aware that gas mains were affected in a similar manner, that is so far as pitting is concerned, before the introduction of electricity?

A. As I said before, the character of the pitting is somewhat different, and the electrolytic pitting has different characteristics from the ordinary sub-soil pitting or depreciation.

Q. Don't you know the character of the soil affects the duration of the main, or affects its condition?

A. It does to a degree, yes, sir.

Q. And causes pitting?

A. It may cause pitting, depending upon the character, but not pitting of this character.

Q. And it is not true that the action where there is no electricity, but where the pitting is caused by the soil, that that is due to electrical agency, by each of the numerous particles of carbon being in contact with the iron, which, aided by the moisture, forms little batteries and produce the rapid decay?

A. I would consider that to be rather hypothetical. I
5798 should not look for electricity as an operating agent, but simply consider it was a chemical action.

Q. I call your attention to a book which I hold in my hand, entitled *Gas and Gas Works*, by Hughes & O'Connor, published in London by Crosby, Lockwood & Son, in 1904, in which this statement appears, and ask you if you agree with the statement which I read:

"There are, however, certain destructive agencies which materially affect the durability of mains; thus it is said that the worst of all ground in which pipes can be laid is 'that containing ashes, cinders and moisture; in these the pipes are speedily covered with marks throughout, similar to pock marks, some of which eventually penetrate the metal. This action is undoubtedly due to electrical agency, by each of the numerous particles of carbon being in contact with the iron, which, aided by the moisture, form little batteries, and produce the rapid decay.' In sandy, saline ground a coat of oxide forms itself on the exterior, which materially diminishes the thickness of the iron of the pipe, but the metal does not alter in its nature. In made ground, cast-iron pipes become rotten and soft. Lastly, in clayey soil the iron is kept in an extraordinary state of preservation, and we have known pipes to be embedded in clay, with a view of their preservation. Therefore, the duration of mains depends entirely on the soil in which they are laid."

Do you agree with that proposition as laid down there?

A. I agree wtih that largely, excepting the somewhat hypothetical bringing in ordinary chamical action—bringing in electricity as an agent. I think that is hypothetical. I have seen just those
5799 conditions that are referred there, depreciation of iron in contact with ashes and water in the attempt to convey material, wet ashes, in conveyors without being in the ground at all; I consider that a mere case of chemical action.

Q. Have you ever seen pitted pipe from breweries or ice manufacturing establishments?

A. Not that I remember.

Q. Do you know that boiler plates pit in the presence of purest water?

A. Yes, sir.

Q. Do you know of any causes outside of what you have just stated of pitting where there could not be any extraneous current of electricity?

A. Well, I have said that I believed that pitting of a certain character could proceed without the interposition of a current of electricity.

Q. Can you say what pitting would have happened to your pipe exhibit here, assuming there was no extraneous electric current?

A. I would say the condition would be not at all as shown in the exhibits.

Q. By that you embrace all the exhibits, these pipes, do you?

A. Yes, I refer to them all.

Q. Can you describe accurately what the difference is in the pitting arising from extraneous electrical currents, and what arises from internal action of the soil and so forth, as I have mentioned?

A. Well, it is a little hard to describe that in words, it being rather an appearance; but in general a pitting that is caused by subsoil conditions is apt to be more of the character of a flaky—larger areas are involved. The material is more apt to come away in flakes, more like the ordinary rusting, or oxidation of iron. It is very much less likely to be in clearly defined removal holes of the material with a clear cut eaten contour. These effects are somewhat different. One is apt to be flaky and the other is apt to be more of the char-
5800 acter of a true pitting, and very seldom will you find a merely chemical pitting that has the shape of a hole; quite a local hole with clearly defined sharp contours, as is apt to be the case with electroyltic corrosion.

By Mr. **Mathewson**:

Q. Sort of a crater?

A. Yes, a volcanic crater is a fair analogy of the effects that are observable.

By Mr. **Burr**:

Q. Mr. Simpson testified, he being the superintendent of mains of the Consolidated Gas Company, that in all his experience he saw only two instances of what might be called pitting, and of course he did not claim to be an electrical expert, and did not know whether that pitting was actually due to the action of electricity or not, but he said inferentially that that is what he understood from Mr. Maxwell. Now, as a matter of fact there are not a great many cases of pitting in the City of New York, are there?

A. Having seen a very large number of tubes, iron tubes, Edison tubes, removed from various sections of the city I have observed very, very little of that. I have in my experience observed some cases of that where pipe in very peculiar soil, which were the detritus of past ages, and giving a very strong acid re-action, as well as that might interest the archæologist. I have seen in such soils rather unusual cases of iron pipe being eaten up, but that is not the case in New York City.

Q. Mr. Simpson says there was one case two years ago right in front of the Brooklyn Bridge, right in front of the Park Row entrance, and the other was at the corner of Church Street and Spring. Those are all the cases he was able to find, though he had
5801 seen ninety per cent. of the mains of the Consolidated Gas Company.

Mr. **Mathewson**: Not within the last two or three years, since this electrical condition has existed. Our claim is that the situation is now present, that we have got to provide for it in the future, that it is just occurring, beginning and begun. That is the point, not that it was fifteen, twenty or ten years ago.

Mr. **Burr**: But I understand it has been obviated and removed so far as this witness' company is concerned and——

Mr. **Mathewson**: Not at all.

Mr. Burr: And that the other companies are adopting precautions which will remove in so far as the L structure is concerned.

Mr. Mathewson: No.

Q. Have you explained as fully as you care to the difference between pittings caused by wandering electrical current and pittings caused by subsoil conditions?

A. My description is as near as I can put it in words, from the very numerous cases that I have seen and have seen illustrated.

By Mr. Mathewson:

Q. It is much easier to detect the difference in the character of pittings than it is to describe it, is it not?

A. Yes, sir.

Q. It is a matter of the eye?

A. Yes, it is fairly well defined, it is characteristic.

Mr. Burr: If it can be seen, I should think it could be described.

Mr. Mathewson: It is difficult to describe some things we can see.

5802 Q. These services or pipes which have been here presented and which have been put in evidence and the others which are here are all wrought iron, aren't they, if you know?

A. Yes, they are.

Q. While the mains of the Consolidated Gas Company are cast iron?

A. Yes.

Q. Now, the electrolytic action when it reaches dangerous proportions would be first observable in its effect on wrought iron, would it not?

A. Yes.

Q. That is more subject to deterioration than cast iron?

A. Well, there are other elements. Cast iron, due to its making, has a kind of thin coat which acts for a certain time as a kind of protective coating, so that electrolytic corrosion does not take hold of a gas pipe quite as quickly on account of the difference in the service presented.

Alexander Maxwell resumed.

By Mr. Mathewson:

Q. You said at the conclusion of yesterday's testimony that you also had a one-inch gas service which was also taken from 496 West Broadway?

A. Yes, sir.

Q. And the location of that with the electrical readings also appear on Figure 7, I think, which is Complainant's Exhibit 318; is that right?

A. Yes, sir, that is correct.

Q. Now, there is a hole in this pipe, is there not?

A. Yes, sir.

Q. Is that the long pipe?

A. Yes, sir.
Q. Will you point out the hole up there?
A. Here (indicating).
Q. That is quite a distinct hole, isn't it?
A. Yes, sir.

5803 Mr. Mathewson: I offer the pipe in evidence.
Mr. Burr: Same objection.
The Master: Same ruling.
Mr. Burr: Exception.
Pipe received in evidence and marked Complainant's Exhibit 319.

Q. Did you also take a two-inch service pipe from in front of 428 West Broadway?
A. Yes, sir.
Q. Will you produce that pipe?
A. Yes.

(Witness produces pipe.)
Mr. Burr: Do I understand Mr. Maxwell is the man who removed the pipes?
Mr. Mathewson: Yes, he saw them removed and labelled them and everything. I will ask a general question as to that a little later. I offer that pipe in evidence.
Mr. Burr: Same objection.
Same ruling. Exception.
Pipe received in evidence and marked Complainant's Exhibit 320*a* and 320*b*.

Q. There is a hole in this pipe 320*a*, is there not?
A. Yes, sir.
Q. Where the wire goes through?
A. Yes, sir.
Q. And that is found, as to electrical readings and locations, on Figure 8, which I show you, is it not?
A. Yes, sir.

Mr. Mathewson: I offer that in evidence.
Paper received in evidence and marked Complainant's Exhibit No. 321.

Q. Now, Mr. Maxwell, to be brief, I want to ask you whether you pointed out the pipes in each one of the instances where you have introduced pipes here, for the workmen to remove?
A. Yes, sir.
5804 Q. And you selected the pipe at that point?
A. Yes, sir.
Q. Was it removed under your supervision?
A. Yes, sir.
Q. Were these different pieces of pipe marked and tagged in your presence?
A. Yes, sir.
Q. And you know they came from the locations which are indicated?
A. Yes, sir.

Q. And which are shown on these exhibits which you have testified?

A. Yes, sir.

Q. Now, what led you to go to this particular section and have pipes uncovered for the purpose of examining them?

A. I had previously made electrical potential readings which indicated that section of the city as a section in which I would be quite likely to find electrolytic action.

Q. The conditions so far as your readings before removal of pipe showed them, seemed favorable, did they, for such action?

A. Yes, sir.

Q. You had previously made tests at Grand Street and West Broadway, had you not?

A. Yes, sir.

Q. And did you find there two gas pipes, two six-inch gas pipes, one of wrought iron and one of cast iron, do you remember?

A. Yes, sir.

Q. What was the character of the wrought iron pipe as to being offset around the joints?

A. The offset around the mains, that is, in the two laps, was of wrought iron, and the straight run was cast iron.

Q. Does this figure, which I show you, show the results of the electrical tests at that point?

A. Yes, sir.

Mr. Mathewson: I offer that in evidence.

Same objection and ruling.

Exception.

Paper marked Complainant's Exhibit 322.

5805 Q. In addition to these wrought iron services—they are wrought iron, which you have introduced, all of them?

A. Yes, sir.

Q. In addition to these wrought iron services, did you take out or have taken out two lead sections of Edison cables—do you call it?

A. Yes, sir.

Q. Which have been commented upon here and produced here this morning by Mr. Lieb?

A. Yes, I took them out myself.

Q. Will you state where they were located?

A. On the north side of Spring Street between West Broadway and Thompson.

Q. Where, in relation to the substation of the elevated road?

A. The pitted portions which I have here were immediately in front of the elevated substation or within a few feet on either side.

Q. Those two sections that have been introduced?

A. Yes, sir.

Mr. Mathewson: I offer them in evidence.

Same objection and ruling.

Exception.

The pipes were received in evidence and the long section of pipe marked Complainant's Exhibit 323 and the short section of pipe marked Complainant's Exhibit 324.

Q. Now, Mr. Maxwell, you noticed the location of the pittings on these service pipes, did you not, in relation to the elevated pillar, that is to say as to how the pittings were turned, in what direction?

A. Yes, sir.

Q. I will ask you whether the location of the pittings on the services as they lay in the ground relative to the elevated pillar were such as in your judgment would indicate that current was leaving the services and going to the pillar?

A. Quite conclusively, I should say.

5806 Q. How close were the services to the pillars, do they appear on these small maps

A. I think the distances are very generally given; ordinarily three, four or five feet——

Q. Quite close?

A. Six or seven feet in some cases.

Cross-examination by Mr. PAGE:

Q. In order to have the condition that you say, of the current leaving the pipes and going to the elevated structure, the pipes would be positive to the structure, would they not?

A. Yes.

Q. Now, these cables, sections of which you have brought here, are regular cables of the Edison Company that are laid throughout the streets of New York?

A. Yes.

Q. And as I understand it, these are not laid in sections, but are practically a continuous cable?

A. Yes.

Q. Will you take Exhibit 320-B and tell me where you discover the electrolytic action there?

A. Yes, sir. I should say that that was electrolytic action (indicating).

Q. I understand your testimony to be that the electrolytic action takes place on the side of the pipe from which the current leaves it?

A. Yes.

Q. And not on the opposite side?

A. No.

Q. Turn it over. What do you find on the opposite side?

A. Some further action.

Q. Action of what kind?

A. Electrolytic action.

Q. Then as I understand it the current was leaving this pipe in two different directions, is that right?

A. Well, not quite as you state it.

Q. Well, how do you state it, there are opposite sides of the pipe, both showing electrolytic action?

A. Yes, sir. The greater action on the side which was towards the L pillar, the heaviest action.

5807 Q. Yes, but there was also a lighter electrolytic action on the other side?

A. Yes, sir.

Q. And the currents must have been leaving this side then to produce this action?

A. This way, I should say (indicating).

Q. What do you mean to say, that it perfo-med a somersault, and started out this side and jumped over?

A. Probably.

Q. Is it probable?

A. It is the only possible explanation, I should say.

Q. On what do you base that, as to that being the only possible explanation?

A. Well, that the pitting or scoring is evidently electrolytic and that the current, in my opinion, went to the L pillar, and if it went on the off-side of the pipe it must have turned around through the ground and straightened itself out to get to the pillar.

Q. Yes, it must, I suppose, if it did that. Then you think that the current left the pipe, passed through the ground over the top of the pipe to go to the pillar?

A. Yes, sir.

Q. Now, is not the ground of higher resistance than the pipe?

A. In general.

Q. And don't you think it would go on around the pipe, out on the other side rather than pass through the ground, which was of higher resistance than the pipe?

A. Not in this particular case, I should say; no, sir.

A. As I understand, electrolytic action produces a distinct pitting, while ordinary oxidation covers a larger surface and shows a scaling off?

A. Yes, in general.

Q. Now, on one side of that pipe you say it shows a distinct electrolytic condition?

A. Yes.

Q. That is, on this side?

A. Yes, sir, there (indicating).

5808 Q. Now, do you observe the same on the other, or might that be occasioned by oxidation and the gripping of the tongs in unscrewing it?

A. I should say that that was not oxidation.

Q. That covers a surface of some inch and a half, does it not?

A. Yes, roughly.

Q. And on this side it covers a somewhat larger surface?

A. Yes, sir.

Q. Now, we notice, turning the pipe in this way, there are some marks of deterioration. What are those occasioned by?

A. They are not so definite; I should say that they were probably electrolytic, possibly due to oxidation.

Q. Then I understand that not alone was the electric current leaving this side, but it was also leaving the opposite side and also shooting up into the air from out of the pipe?

A. Yes, sir—up in the earth, not in the air.

Q. Well, up in the earth.

Mr. Mathewson: You understand Senator, that this witness has not been called to testify to anything except pipe and the identification of it. I am not introducing him as an expert on this particular subject, and while, if you care to go on I have not any objection——

Mr. Page: Yes you have, he testified this was electrolytic action.

Mr. Mathewson: I did not ask him any such thing. I asked him about the pipe, and if it showed a hole through it. I have not asked him a word as to whether it was electrolytic action or not. He said those charts showed the readings of the location and the electrical readings. I am calling attention to the fact that you are making him your own witness on this subject.

5809 Mr. Page: Not at all, I will take the risk of that on the record. You cannot put a witness on to swear he has taken the readings, and who swears the electricity has left the pipe, and that this is the result of electrolytic action, and then escape cross-examination.

Mr. Mathewson: He has not sworn to anything of that kind.

Mr. Page: Yes he has.

The Master: Well, do not argue about it, gentlemen. He is entitled to cross-examine the witness.

Q. We find, proceeding down about twelve inches, another eruptive condition, we might say, what do you think that is?

A. That might be due to electrolysis, and probably is; possibly oxidation.

Q. Let us see, that is about on a line with the first that you spoke of, is it not?

A. Yes, sir.

Q. Turn around about half way on the pipe from there and we find a considerable pockmarked condition. What is that? Is that electrolytic or oxidation?

A. For those I should say probably oxidation; possibly electrolysis.

Q. Are not these small places more clearly defined and nearer a round hole, or nearer a hole with those edges, or whatever it was that Mr. Lieb said?

A. Yes, sir; they fit Mr. Lieb's definition better.

Q. These fit Mr. Lieb's definition better than the other one you have spoken of, do they not?

A. Yes, sir.

Q. Now, Mr. Lieb is a very eminent expert, is he not, on electricity?

A. Yes, sir.

Q. And if you find a condition in a pipe where the description more nearly answers his description of the effects of electrolysis than these larger places that you specified, would you not be in-
5810 clined to think that these small places were the places where the electrolytic action has taken place?

A. I should say not in this particular exhibit.

Q. You will notice that the extension from the place that you first selected as being surely electrolytic, or what you thought was electrolytic action on top of the pipe, extends continuously for about six inches?

A. Yes.

Q. Now, we will take a look at this, which is Complainant's Exhibit 320A. I understand you are very positive that this hole is occasioned by electrolysis.

Mr. MATHEWSON: He has not stated so at all. I merely asked him if there was a hole and he said there was. He has not stated what it was due to. You are examining him about something he has not testified to on his direct examination.

Mr. PAGE: I am afraid you don't know the questions you asked and the answers he gave.

The MASTER: Well, he can answer it now, or if he cannot he may say so.

Mr. MATHEWSON: I submit this is not cross-examination, and we did not present this man as a witness on that subject.

Q. I call your attention to a place, well, within an inch and a half, of that, where there appear to be some pit marks?

A. Yes.

Q. What do you think that is occasioned by?

A. It is hard to say.

Q. Does that look like electrolytic action to you?

A. Not particularly. It might have been. The exhibit was chosen for the other action there.

Q. Chosen for what other action?

A. The action on the other section of it, which I took to be electrolytic. This was included as part of the pipe.

5811 Q. Comparing this exhibit 320-A with 320-B, the portion that you have stated to be undoubtedly electrolytic, you find great similarity?

A. Only a general similarity. I would say there are a number of points of difference.

Q. Can you say that these depressions or holes are occasioned by electrolysis or by erosion, I mean by erosion, rusting?

A. I would hardly care to state it as to these two holes.

Q. On the opposite side of this pipe we find also opposite to the hole a condition of erosion. Is this the case where the electricity was shooting out in all directions and went out on that side of the pipe?

A. That question is very hard to say. This is evidently an exceedingly old service pipe.

Q. Wrought iron service pipes will rust, won't they?

A. No doubt of it.

Q. Laid in any kind of earth. All of these exhibits that you have produced were taken within one block, were they not, except the last cable?

A. One or two—the higher numbers, 496, may go two blocks; I am not quite sure.

Q. How long ago did you remove them?

A. July, 1906.

Q. Between what streets did you take them?

A. As I just said, between Spring and either Prince or Houston, the most of them were between Spring and Prince.

Q. Did you make any observation of the soil there is there?

A. Generally, I saw it, of course.

Q. Is it filled in or is it the original soil?

A. It is the natural soil.

Q. Is it such as the archaeologist would be interested in, as Mr. Lieb said?

A. No, sir.

Q. Now, this long pipe up here, which is Complainant's Exhibit 319; there is a great deal of oxidation on that pipe throughout, isn't there?

5812 A. There is a great deal of oxidation on some parts of it, yes, sir.

Q. Well, extending pretty well the length of the pipe?

A. Yes, sir.

Q. Now, this hole that we discover is a long, narrow hole, that is, when I say long, of considerable length for its width?

A. Yes, sir. .

Q. It is not a distinct pitting, is it?

A. Well, when it goes through it ceases to be a pit, when it comes to be a hole. I think before it went through it would have been a fairly distinct pit, yes, sir.

The Master: It is about an inch long.

The Witness: Yes.

Q. Don't you find that all around this hole there is considerable oxidation?

A. I am not sure that that is oxidation.

Q. Well, just press that with your thumb nail above and see what you think of it?

Y. Yes, it is very soft.

Q. The pipe is very soft, it shows evidence of considerable oxidation, does it not?

A. It might not be oxidation.

Q. Well, what might it be?

A. Where the metal is removed, that might well be due to electrolytic action; I think a great deal of that loose material is dirt and earth caked on there.

Q. Then your idea is that the condition that we find this pipe in all through here is due to electrolytic action?

A. No, no. A good portion of that pipe was within a building, and is undoubtedly oxidation; in the air it was, a portion of it.

Q. What portion was in the air and what portion in the soil?

A. This portion down here, this lower end, was in a vault, and if I am not mistaken the wall came through in this neighborhood, or it went through the wall, rather.

5813 Q. Can you tell from the difference in oxidation which part of it was in the earth and which part was in the air?

A. Yes, sir, I should say there was quite a marked difference there from the appearance of the pipe there and there and from there up (indicating).

Q. From here up, which is about half way the length of the pipe, and leading towards—what would you call that up there, the hub joint?

A. It is a coupling.

Q. That is, it is cut off on the other side of a joint so it gives that appearance as if it were sticking out?

A. Yes, sir.

Q. Is there not in that end of the pipe a very distinct oxidation all the way from the place where you say it enters the soil?

A. Yes, there is oxidation, although it is not distinct, I should say. A great deal of those irregularities, a great many of them were caked earth. The pipes have not been cleaned; they are practically in the same condition now as when they were taken out of the street.

Q. You can pick this pipe to pieces with your finger nails, can't you?

A. I have not tried it. There is a piece of it, yes.

Q. Now, we find this condition obtaining throughout the length of pipe which was in the soil, of great oxidation, don't we, and places that were quite some pitted. Now, throughout the length is that the action of electrolysis or of oxidation, do you think?

A. The only points I would care to definitely fix upon as electrolysis are some of these deeper marks in the neighborhood of the holes.

Q. You think because there is a hole it must be due to electrolysis, and if there is considerable depreciation throughout that must be due to oxidation?

A. I did not state it quite that way.

Q. Well, you can state it any way you want to.

5814 A. I think that hole and those pittings are electrolytic.

Q. What pittings?

A. In that neighborhood right there (indicating).

Q. Well, there is a more distinct pitting below, is there not, than there is at that point?

A. That is of an altogether different character, from here down, those are irregularities, perhaps they are pits, I should say they were not electrolytic.

Q. What is the very distinct characteristic which conveys to your mind that this one spot must be the result of electrolytic action, whereas similar conditions throughout the pipe do not suggest to you that they are electrolytic?

A. I do not quite understand the question.

Q. (Question repeated.)

A. I do not think the conditions throughout the pipe are similar.

Q. Well, what is the difference, that is the point. Tell us the characteristics of electrolytic action that you see in that one spot?

A. Well, if it can be described, the pits are of quite a different character there within the line down there and what that evidently was before that went through, it would be quite different from the surface of the pipe there and three (indicating).

Q. And you refer to a straight line directly in line with the hole, a straight line about an inch and a half in length by a sixteenth of an inch in width, do you?

A. Yes, sir.

Q. Now, wrought iron pipe is welded, is it not, along the seam?

A. Yes, sir, to the best of my knowledge.

Q. And there is apt to be more deterioration along the seam than there is in the other part of the pipe, is there not, if it is subjected to oxidation?

A. I am not sure of that.

5815 Q. If that should be the case and you should find that this hole which is long and narrow and this long and narrow streak below being in the same line, would that convey to your mind that it might be along the seam?

A. I think I would want to have it more definitely shown than that; you say it was along the seam.

Q. Now, we will take this Exhibit 320A. Are not the characteristics of this part that you thought was not electrolytic very similar to the conditions around the hole in this Exhibit 319?

A. Not exactly, I should say; no, sir. I should say that this was more nearly similar to the other section.

Q. Well, what about this hole; do you think it is similar to that?

A. Not in all respects, no, sir.

Q. Then you think there is a substantial difference between the hole in Exhibit 320A and the hole in Exhibit 319?

A. Yes, sir.

Q. And such as would suggest to your mind that they arose from different causes?

A. Yes, sir.

Q. How did you remove this Exhibit 320B from the other section?

A. It was cut off.

Q. Cut off here?

A. Cut off there (indicating).

Q. And unscrewed there?

A. And as I remember it, unscrewed there.

Q. And, of course, you did not unscrew it with your own hands?

A. No.

Q. Used a pipe screw?

A. Yes, a pipe tongs; yes, sir.

Q. And was this part Exhibit 320A a part of the same pipe?

A. Yes.

Q. Did these join?

A. They go on through the coupling, I think; I think they were joined in that manner, as nearly as I remember it.

Q. I find a very similar condition on Exhibit 320A as on Exhibit 320B, that the parts that show—I believe you claim electrolytic action on both sides of the coupling, is not that so?

A. Did I claim that?

Q. Yes.

A. I think not.

5816 Q. Did you not claim that the electrical current was gyrating through the ground, climbing over the top of the pipe and going all around, so as to leave both sides of the pipe at the same time?

A. It left the two points, it probably made contact with the earth, giving preference to the part nearest the elevated pillars.

Q. Don't you find the same condition on the coupling on Exhibit 320-A that you do on Exhibit 320-B?

A. The pipe is all eroded on the coupling, but it looks quite different to me.

Q. Don't you think this action may be occasioned by the gripping of pipe tongs on an old rusty pipe?

A. Hardly, because we chose these exhibits as they lay in the ground before the tongs was put on them.

Q. Here is where the tongs did go on, is it not?

A. I think not. Of course my memory is not exact on that particular point. As I remember it, the way these pipes laid, I think the tongs would have gone on there (indicating).

Q. That is the portion of the pipe which you thought presented some distinct pitting that you think resulted from electrolytic action and looked very much like it, is it not?

A. That was not the distinct part of it, no sir. This was the distinct part of it, in my opinion (indicating).

Q. Yes, I know that was the distinct part, but the other was a very suspicious part, wasn't it?

A. Well, I think I said it might have been electrolytic.

Mr. **Mathewson**: You ought to have taken your hand and not put the nippers on.

Mr. **Page**: No, I don't think he would have produced as good an exhibit for your purposes if he had.

Mr. **Mathewson**: I think he would if he chose the pipe before the tongs were put on at all.

5817 Mr. **Burr**: These are all wrought iron services, are they?

Mr. **Mathewson**: Yes.

Q. You made this map, Complainant's Exhibit 303, did you?

A. Yes, sir.

Q. I understand that you made tests throughout the city and selected this as probably the most fruitful field. Did you find similar conditions in other parts of the city?

A. Yes, sir, in some parts of the city.

Q. What parts?

A. In the neighborhood of railway substations generally.

By Mr. **Mathewson**:

Q. Elevated railway?

A. Elevated railway, yes, sir.

By Mr. **Page**:

Q. Just state where?

A. The particular substations, do you mean?

Mr. **Mathewson**: Where are the elevated substations?

Q. No, I do not say where are the elevated railway substations, but at what elevated railway substation did you find a similar condition existing?

A. In the neighborhood of the 53rd Street Interborough, and to a slight degree in the neighborhood of the East 34th Street elevated station; my tests were not very extensive around the 34th Street station.

Q. Have you got the results of your experiments in those other stations?

A. I am not certain about the 34th Street. I have some material relating to 53rd Street.

5818 Mr. Page: That is all.

By Mr. Burr:

Q. When you speak of the Interborough stations and Manhattan stations, you mean substations belonging to the same line?

A. Yes, sir. I think I have used the word indifferently; it is the elevated railway substations that I refer to.

Q. Now known as the Interborough Rapid Transit?

A. Yes.

Q. Do you remember when you took up the pipe to which your attention has been called at 342 West Broadway?

A. 432 West Broadway?

Q. Yes.

A. One of these exhibits, do you mean?

Q. Yes.

A. I can tell you the month.

Q. The pipe is marked Exhibit 304. Do you remember the day when you took it from that locality?

A. I do not remember the exact day without referring to my notes, no, sir.

Q. Well, you do recall that it was in July?

A. Yes, sir.

Q. Or was it in April?

A. July.

Q. And after you removed these pipes, were they all removed in July, by the way?

A. Yes, sir.

Q. In the early or latter part of July?

A. Early in July.

Q. Did you call Mr. Simpson's attention to these pipes?

A. Not personally, no sir, not that I remember.

Q. When was it that you had the conversation with Mr. Simpson regarding the pipes and mains of the Consolidated Gas Company?

A. My memory is not quite clear. I saw Mr. Simpson once in May, I know, and I had seen him earlier, but I cannot place the date exactly.

Q. You say you did not see him personally. Do you know who called his attention to these pipes and when?

5819 Mr. Mathewson: There is no testimony that anybody called his attention to them. On the contrary, Mr. Lieb said he doubted it had been. Do not ask your questions in such a way as to mislead the witness.

Mr. **Burr**: I beg your pardon, I am not misleading the witness. He says he does not know personally that Mr. Simpson saw these pipes, and I ask him if he knows indirectly that Mr. Simpson saw these pipes.

The **Witness**: No, sir.

Q. You had no talk with Mr. Simpson with regard to these pipes at all?

A. No, sir, these pipes.

Q. With regard to these pipes. Have you had talks with regard to any of the pipes and services with Mr. Simpson since July?

A. I think not.

Q. You would not be sure?

A. I am pretty sure.

Q. Do you recall the two instances of pipe that you spoke with Mr. Simpson regarding the one at the Brooklyn Bridge and the other at Church Street and Spring?

A. No, sir; I do not recall that at present.

Q. Did you ever have any such conversation with him?

A. Quite possibly.

Q. But you have no recollection of it?

A. Not at the moment, no, sir.

Q. Do you know what was the character of the soil—I think you said it was not filled ground, it was natural soil at this point?

A. I recognized it as natural soil; I am hardly an expert on that, perhaps.

Mr. **Mathewson**: What point is that.

Mr. **Burr**: West Broadway.

5820 Q. Do you know the character of the soil you took all these pieces from? Was the soil in each instance natural soil or filled in soil?

A. In each instance natural soil, to my best memory.

Q. Have you ever seen a pitted pipe which was not at all affected by electricity or which it was not claimed was affected by electricity?

Mr. **Mathewson**: That is a pretty broad question.

Q. In other words, did you ever see a pipe removed from the ground in the City of New York before the use of electricity in the City of New York?

A. Well, I guess I have seen numbers of pipes removed before electricity was introduced in New York; yes, sir; I was not taking notice of pipes in those days.

Q. Has your attention ever been called to a pipe which it was claimed was corroded or pitted or affected in any degree through electric currents, wandering currents, or to another pipe which was affected solely by subsoil conditions?

A. I don't know that that comparison has ever been brought to my direct attention. I have a pretty definite idea of the difference between the two actions myself.

Q. Do you know whether the soil from which you took Exhibit 320A was wet or dry? And I will ask you the same question with regard to 320B?

A. That seems a little difficult to state offhand; it is a matter of degree altogether as to the wetness or dryness.

Q. Well, what is your recollection of it?

A. It was not swampy.

Q. Was it a moist soil?

A. As a matter of fact, it would be a little hard to tell what it would be under normal conditions. We were working on excavation and July was rainy, if you remember, and there was a great deal of surface moisture from time to time. The soil as we saw it, 5821 it was, of course, very wet sometimes, but I do not think that represented its normal condition at all. Really I don't know.

Q. Can you say whether if there was free acidity in the moisture in the soil if pitting would be caused quicker than through electrolysis?

A. Repeat that question.

Q. If there was free acidity in the moisture in the soil, would not this cause pitting quicker than electrolysis?

A. In my opinion that would not cause what I recognize as pitting.

Q. If the soil contains salt and chlorid of magnesium, would not this have more action in the iron pipe than electrolysis?

A. In this case also it will be of a different character, I think, as to the degree of the action I don't know.

Q. How long had each of these pipes been in the ground before you took it up?

A. I have no certain knowledge on that.

Q. Do you know what the usual length of life of the pipe buried in the soil is, which is not acted on electrically?

A. No, sir.

Q. Have you ever made any tests as to the effect of electrolysis on iron pipe?

A. I have made—not on pipes; I have made laboratory tests as to the effects of electrolysis on iron samples, that is all.

Q. In damp soil which is slightly acid, would not there be action between any two different metals, whether they were charged with electricity or not?

A. That has been stated, I believe. In my opinion the action would be slight.

Q. What depth or under what conditions were the pipes you have referred to and brought here as exhibits at the time they were removed from their surroundings?

A. I do not quite catch that.

Q. At what depths and under what conditions were the pipes you have referred to and brought here as exhibits at the time you 5822 removed them from their surroundings?

A. They were in general three to four or sometimes five feet under the street surface, as I remember it. I do not quite understand how you mean by the conditions other than that.

Q. I think you have stated already what you found as to their proximity to the elevated pillars?

A. I see, yes sir. They were in general quite near the elevated pillars.

Q. Have you had much experience or any experience with gas mains or gas services before this observation of yours at these points from which these pipes were removed?

A. No, sir; I should not say that I had had any very especial experience with gas mains before that time.

Mr. Mathewson: Or gas services, Mr. Burr said.

The Witness: Or gas services.

Q. Have you ever made any relative tests as to the different action of pipes corroded by acid and mineral salts in relation to the relative effect and speed of destruction, compared with a pipe affected with electrolysis, and if so, under what conditions?

A. No, sir; I have never made the tests, excepting as related to electrolysis.

Q. Upon what do you base your comparisons, then?

A. Not on direct tests. I say I based the comparison on a general impression as to the extent of local galvanic action.

Q. On a general impression instead of a scientific test?

A. Well, the general impression, I suppose, has been derived from numerous other scientific tests of other people which I have encountered from time to time.

Q. You have received an impression from other people without knowing whether it was an erroneous or correct impression and acted upon that impression?

5823 & 5824

A. Well, the impression would be drawn probably from authorities, writers of treatises and that sort of thing.

Q. Well, that is a probability upon a probability.

A. It certainly is not as good as a direct test.

Q. You were not called upon to make any examination with regard to gas mains, were you, but only with regard to these services?

A. Well, sir, I made some tests on gas mains.

By Mr. Mathewson:

Q. Referring to these different sketches, showing the location of the different pieces of pipe which you took out, where you show the letters A, B and C, that refers to mains?

A. Yes, sir.

Q. A main at A or at B?

A. Yes, sir.

Q. And where the cross pipe ends at A or B, that means a service comes out of that main?

A. That the service was connected to that main at A or B.

Q. How old are you, Mr. Maxwell?

A. I was twenty-eight years old in May, 1906.

At 1:00 P. M. adjourned to Monday, January 21st, 1907, at 11:00 A. M.

Last Exhibits:

Complainant's Exhibit 322.
State's Exhibit 000.
City's Exhibit 236.
260—396

5825 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucian L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, *January* 21, 1907.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

5826 Albert F. Ganz, a witness called on behalf of complainant, in rebuttal, being first duly sworn, testified as follows:

Direct examination by Mr. Mathewson:

Q. Where do you reside, Professor?
A. Hoboken, New Jersey.
Q. What position do you hold at present?
A. I am Professor of Electrical Engineering and head of the Department of Electrical Engineering in Stevens' Institute of Technology, Hoboken, New Jersey.
Q. And before that did you occupy the double chair of Physics and Electricity at Hoboken, in Stevens' Institute?
A. I was Assistant Professor of both Physics and Applied Electricity before that time.
Q. What degree do you hold in engineering?
A. The degree of mechanical engineer.
Q. Were you the electrical expert employed by the American Gas Light Association within the past few years to make an extended investigation of electrolysis and its effects throughout various parts of the United States?
A. I was so employed by the Committee on Electrolysis of the American Gas Light Association, and in conjunction with them I rendered a report on this subject of electrolysis to the American Gas Light Association.
Q. In that connection, in addition to your general knowledge on the subject of electrolysis and its appearance and effect, did you make a special study of the subject?
A. I did, most extensively. I reviewed all the reports and papers on the subject that had been written to date, including not only those in America but also the important ones in England and Germany, and in fact I collated the important data which had been
5827 published by that time and condensed it and it is in that condensed form published in our report to the Association. I

also myself translated the report made by the German Commission appointed to investigate this same subject, and a condensed translation of this is also published in this report. In addition to that I made a number of laboratory experiments for the purpose of familiarizing myself perfectly with the phenomena and verifying many of the facts which I knew, but which I wanted to be perfectly sure of.

Q. To confirm them by personal experiments?

A. Actual scientific experiments.

Q. Did your investigations by appointment of this Committee on Electrolysis of the American Gas Light Association extend generally over the country in many places, or was it confined to one?

A. The investigations of the reports which I referred to before were scattered all over this country.

Q. At page 3913 of the testimony Professor Sever refers to stray currents, and he is asked whether they do not mean a loss of energy and, therefore, a loss of coal and, therefore, a loss of dollars and cents. Have you read Professor Sever's testimony in this case?

A. I have.

Q. What is your answer to that proposition, in your judgment?

A. I would say that Prof. Sever's answer implies yes, while as a matter of fact the straying of currents from their proper return conductors affords a saving of energy and of coal, and not a continued loss of coal, and for the following reasons: Let us suppose the Manhattan Elevated, for example, was perfectly insulated so that all the return current would pass back to the power station over their own return conductors, that under those circumstances the loss of energy due to the drop in voltage was say ten per cent., and then let
5828 us assume a second case where the structure was so poorly insulated that half of the return current passed through the ground and back to the station, then the loss in energy would only be five per cent., and therefore, the straying of the currents under the circumstances cited really means a gain in energy and not a loss.

Q. At page 3915 Professor Sever states, if I understand him correctly, that the Edison neutral is grounded so as to neutralize the potentials in the system; is this the object?

A. No, sir.

Q. What is the purpose?

A. The Edison neutral in New York City has such an abundance of copper that there is substantially no potential difference set up between grounded points of the neutral, and, therefore, there is no object whatever in grounding the neutral for the purpose of returning any neutral current. The object of grounding the neutral is as a safety measure for the consumer and a safety measure to assure continuity of service. Without such grounding there would be a considerable additional hazard both to life and from a fire standpoint to the consumer, and it is for that reason that the neutral is grounded.

Q. Now, at page 3916 Mr. Sever refers to the passage of the current of the unbalanced neutrals of the New York Edison. Are there any ground currents due to that cause?

A. I should say that there were no ground currents of any substantial character due to the Edison neutral, because the copper provided for the return of this Edison neutral current is so large that the path shunted through the ground from these grounded ends of the neutral would substantially take no current.

Q. Did you make any tests, investigations, yourself, to determine as to the situation of the New York Edison Company, as to its 5829 stray currents or dangerous currents?

A. I was detailed by the Consolidated Gas Company to make as extended an investigation of the Edison neutral as I considered necessary to establish the fact or the facts in the case, and I made such an investigation covering a period of several weeks, and I found the conditions such as I have stated.

Q. At page 3935 Prof. Sever refers to the return feeders on the Manhattan Elevated Railway structure. Are there any return feeders?

A. There are no return feeders in the sense that that term is used. The only copper that is used to connect the structure with the negative bus bar of the station are the bare copper conductors right at the substations, but there are no return feeders paralleling the structure such as are used in the subway.

Q. Prof. Sever also says that the New York, New Haven & Hartford electrical system which is being installed for local service uses an alternating current. (3931, 3938.) Now what is the fact in reference to this installation?

A. The New York, New Haven & Hartford Railroad will employ alternating current from Woodlawn out, and it will employ the direct currents used on the New York Central Railroad from Woodlawn to the Grand Central station, and therefore, so far as the effect of stray currents on the Island of Manhattan is concerned, the New York, New Haven & Hartford is just as much a menace to the piping system as the New York Central in the territory in which our pipes are located; it employs direct current exactly as the New York Central.

Q. At page 3939 of the testimony Prof. Sever refers to the amount of voltage required to produce electrolysis. What is your view on that subject?

A. The statement Prof. Sever makes is that it takes from 5830 one and one-half to two volts to electrolyze water. That is the fact, however, only if the current passes through water from a non-oxidizable anode, but it is not the fact when current passes from an oxidizable anode, as, for instance, from iron or from lead. In the latter case or cases the iron or the lead is oxidized and furnishes a source of electromotive force in itself, so we have no electromotive force counteracting the current due to that electrochemical action. We only find in practice, and this I know from personal experiment, that when a current passes from an iron pipe, say, through the ground to another iron pipe, but that it meets small counter electromotive forces which I should say amount to one-half volt, from my experience, and these are due to changes in the densities of the electrolytes produced by the current itself and are not due to the same cause which produces the counter electromotive force of one and one-half to two volts as stated in the previous answer of Dr. Sever.

Q. Dr. Sever at page 3941 states in substance that a current would follow lead sheath rather than water and gas pipes. Do you concur in the accuracy of that statement?

A. No, sir. A current of electricity will always divide itself between all the paths open to it in the direct ratio of their respective conductivities.

Q. Is that what is known as Ohm's law, or somebody else's law?

A. It is an application of Ohm's law to divided circuits and it is exactly the same case as, for instance, if we had a cylinder containing gas under pressure and there were several leaks in that cylinder and one of the leaks were a large leak and the others small leaks, where we would have gas escaping from every one of the leaks. Just in the same way with electric current, it will divide itself between all
possible paths and, therefore, if a current straying in the
5831 ground finds open to it a lead sheath and a gas pipe, it will
divide itself between the two in direct proportion to the conductivities. It is a fact that the lead sheathings of cables are continuous conductors and do not have joints like gas pipes. On the other hand gas pipes are buried in the ground and make better contact with the ground than do the lead sheaths, and for that reason we may expect considerable currents on gas pipes, in spite of their joints.

Q. Is the return rail system of the subway as highly insulated to the ground as Professor Sever has described?

A. It was originally so highly insulated, that is the structure which Professor Sever has described, is substantially the structure which was installed. Since that time, however, connections have been made between the rails at different points, and the metal of the structure itself which is grounding the return system and thus making it possible for stray current to get into the pipes.

Q. That is the present situation?

A. That is the present situation.

Q. You saw and examined the other day the map showing the electrostatic condition in May, 1902, or about that time, as presented by Mr. Varley, being complainant's Exhibit 301, did you?

A. I did.

Q. And did you also see the map (Complainant's Exhibit 302) here later and presented by Mr. Varley, showing the different situation as to electrostatic conditions?

A. I did.

Q. In view of the testimony that no substantial change took place in conditions during the period except the installation of electricity on the elevated railway, what, in your judgment, would the change in the electrostatic condition be due to?

A. To the installation of electricity on the Manhattan Elevated Railway.

Q. Now, it appears that the danger lines, meaning the red
5832 lines on the map, were not only down the lines of the Man-
hattan Elevated according to the 1903 map, but also appeared on the rails along Broadway and in certain streets where the elevated does not run. Would that naturally follow?

A. It would.

Q. Did you also see this map showing section of the City (map, Complainant's Exhibit 303), showing certain electrical conditions in the territory between Canal Street, Hudson River, 14th Street and Broadway?

A. I did.

Q. Indicating the direction of currents to the elevated sub-station?

A. Yes.

Q. Did you also examine the various service pipes and the two lead cables which were put in evidence during Mr. Maxwell's testimony?

A. I did.

Q. And the several charts or scales showing the electrical readings as between the services and the mains with which they were connected and the elevated pillars where they were respectively taken out?

A. I did.

Q. Meaning the charts which have been marked in evidence?

A. I understand.

Q. And did you hear the testimony that all those services were taken out within a space of about two city blocks?

A. I did.

Q. And in this very location which is covered by Complainant's Exhibit 303?

A. Yes, sir.

Q. Did you find on these wrought iron service exhibits any pittings or any other marks which in your judgment were due to electrolysis?

A. I found numerous pittings which indicate electrolysis, and taken together with the location of these pipes in the ground and with the electrical readings which were taken before they were taken out, and also taken together with the measurements of currents showing that current was flowing toward the sub-station located 5833 in this very street, taking all this evidence as a whole I consider it as a positive conclusion that the pittings were due to electrolysis; and, further than that, it is my opinion that even the excessive rusting, in a large measure at least, was due to the action of stray currents which were passing at that point, because it is well known that the effect of stray currents produces, or, rather, increases the chemical action.

Q. If you found a single instance the proof would be less positive of the strength of electrolysis, wouldn't it, or would it still be clear?

A. It would depend upon the circumstances which surrounded that single instance.

Q. But if you found the condition existing in 1902 as indicated, and then the change in 1903, and you then found this map, Exhibit 303, showing the directions of currents as they there existed, and if you then found within the space of two blocks the difference in potentials between the services taken out and the elevated pillars in that immediate section, service after service within that short distance, would not that all taken together amount, in your judgment, to an absolute demonstration that it was electrolysis?

A. It would in my judgment be an absolute demonstration.

Q. Now, will you take the first gas service which was taken out, being the 432 West Broadway example, and point out from the pipe, and illustrate by the readings on the chart, Complainant's Exhibit 305, the electrolytic action.

Mr. Burr: What is the number of that exhibit?

Mr. Mathewson: That must be pipe, Complainant's Exhibit 304?

A. I find in the center of the long part of this pipe one pitting which at the bottom goes entirely through the pipe, and also a number of other pittings, which are, however, not so sharply marked as this particular one. This kind of pitting, that is this kind of hollowing out in local parts, is characteristic of electrolytic corrosion. I would, however, not base an opinion only on the object itself, but this pipe was taken out from the locality shown in Fig. 1 on the blue print, Complainant's Exhibit 305. This service pipe was connected to the gas main marked A in this print, Complainant's Exhibit 305. This gas main was found to be positive to the elevated pillar by one to two volts. This same elevated pillar was located about four feet away from this service pipe. The measurements shown in the large map, Complainant's Exhibit 303, indicate that stray electric currents were actually flowing in the underground metal in the vicinity of this street, and all converging towords the Manhattan Elevated sub-station. A further experiment made on this same street as illustrated in blue print, Exhibit 322, shows that when a gas pipe in the street was connected by a copper wire to the elevated pillar with an ammeter in circuit a large current of 90-amperes was drawn over this wire. That clearly indicates that the potentials which existed between the pipe and elevated pillar on that street were not merely electrostatic potentials, but that they were potentials due to currents, and when the points between which these potentials were existing were connected by a conductor a current flowed. Now then we know that the ground which connected the service pipe with the elevated pillar is an electrolytic conductor and therefore with the potential difference that does exist by measurement a current must have flown, and that, taken together with the actual pitting found, is evidence that this pipe was corroded by electrolysis. The remainder of the pipe is generally rusted. It is my opinion that current was leaving the pipe to a small extent all over the pipe and aggravating the chemical actions and aggravating, therefore, the general rusting and the general deterioriation of the pipe.

5834

5835

Q. And you find in the case of each other service pipe here, do you not, a similar difference, not exactly the same difference, but a similar substantial difference in potential between the pipe and the elevated pillar, as shown by these different exhibit sketches?

A. I do.

Q. And when you find that there are ten or twelve such cases of similar pitting, difference of similar potential within this space of two blocks, what effect does that have on the general conclusion which you have stated from the single instance?

A. It only strengthens it. In fact, I should say it was the most positive evidence that you could possibly get, because you cannot get down in the ground and watch this destruction. The evidence necessarily is this kind of evidence.

Q. Now, will you look at those two lead pipes behind you which have been put in evidence and are exhibits 323 and 324. Lead pipes do not rust, do they, as wrought iron does?

A. Of course that depends on what you mean by rust. They are chemically destroyed, and in that sense you might say they rust.

Q. But you do not find the same rusting that you do on wrought iron so that some not well-informed person might attribute a pitting either to rust or to electrolysis. The character of a lead pipe is substantially different, isn't it?

A. Yes, sir.

Q. Now, will you look at Exhibit 323, and do you observe that that pipe shows the pittings which you have described for half its length and then is smooth the balance of its length?

A. I do.

5836 Q. Now, if it were in the soil and that action were due to the soil alone, there would not be any such difference as that, would there, in the appearance of the two parts of that section?

Mr. Burr: I will ask you to let him state himself what he finds there. Of course I do not think it makes much difference.

The Witness: Shall I answer the question.

Q. Yes.

A. The chemical actions which occur in the soil ordinarily produce a more uniform corrosive effect than is here shown. These particular pittings are characteristic of electrolytic action. They are always found when electrolysis takes place.

Q. And did you hear the testimony as to the location of that lead pipe, Exhibit 324, in relation to the sub-station of the elevated?

A. I did.

Q. And upon that testimony and upon the examination of the pipe, to what would you say those pittings were due, and from what source would you say that the current came that did it?

A. Undoubtedly to currents which strayed from the Manhattan Elevated return and by way of this pipe went back to the sub-station in the street and in front of which this pipe was removed.

Q. And would that action be known as electrolysis?

A. Yes.

Q. I will ask you, in view of the exhibits that have been presented and the electrostatic condition which has been shown and the number of the instances which have been produced within a small area, the pittings on these wrought iron pipes and on the lead pipes could have been produced, so far as the testimony shows, by any other agency except electrolysis?

A. None in my opinion.

5837 Q. And electrolysis from the elevated railway currents?

A. That is my opinion.

Q. Now, counsel for the defendants in the examination of Mr. Maxwell extracted considerable entertainment from the suggestion that if you had a pipe, a gas main, laying some distance from an elevated pillar, that the current must come from that pipe at the point nearest the pillar and if it did do so or if it did not do so, it would not come from points on the other side of the main, and that if it was assumed to come from points on the other side of the main or on the top of the main, that would be ridiculous. What is the fact about that?

A. The fact is it might leave the pipe in any number of places around its circumference, depending entirely on the conductivity of the soil in various places surrounding the pipe. For instance, let us assume that the pavement above the pipe had been cracked——

Mr Burr: What is that paper?

Q. Just a moment. I show you a sketch. You can use this, and then I will offer it perhaps. Assume that the circle surrounded by the points A, B and C is a main, and the points A, B and C are on that main and that the street surface is where I have indicated by the line above, and that the elevated pillar and foundations are in the upright positions which I have indicated. Now, will you express yourself on the subject regarding which I just questioned you?

A. By the law of divided circuits, and assuming that the pipe makes uniform contact with the soil and also that the soil is of uniform conductivity, current will leave the pipe at every point of its circumference and go to the elevated pillar. The strongest current under those circumstances would of course be from a point 5838 nearest to the elevated structure. However, with the soil in the street we do not have that uniform condition and it may well be that the path from the point C, for instance, to the elevated pillar may, due to some accidental reason, be a better path than the path from B directly opposite to the pillar. Both paths may exist and all three in fact may exist, and more may exist, and the current may leave the pipe in just so many places and produce just so many pits.

Q. Assuming, of course, that the pipe was positive to the elevated pillar, as has been testified was the case with these exhibits which have been presented?

A. That of course is my asumption.

Q. Let me show you Complainant's Exhibit 320-A. There appears to be a hole in this pipe on the side lying towards the elevated railway, according to the testimony?

A. Yes.

Q. And on the opposite side of the pipe there seem to be some irregularities?

A. Yes, it is all over here.

Q. Would it be an unusual or uncommon thing for a pipe lying in soil like that in New York City to have the current start at point A on this diagram and arch over the pipe on the opposite side?

A. Not at all.

Q. Or at point C, and arch under the pipe?

A. Yes.

Q. It would not be an extraordinary thing but a very common thing?

A. Yes.

Q. And, therefore, if there are also pittings on the back of this pipe, which are also due to electrolysis, is there anything inconsistent in the science or the art in that?

A. Not at all.

Mr. Mathewson: I will offer this in evidence, it may be placed on the record for purposes of illustration.

5839 Paper received in evidence and marked Complainant's Exhibit 325.

Q. Testimony was given, Professor Ganz, by Professor Bemis, and some of the witnesses for the defendants, in reference to an expected very great increase in the sales of gas, which I assume would be affected by the cheapness or efficiency of other illuminating apparatus. Can you tell me whether there are improvements now in progress, or virtually attained in connection with incandescent lamps that would increase such efficiency and cheapness of that illuminant?

Mr. Kirby: I object to that; it is opening up a field into which we could go until next summer. It is not proper rebuttal.

Mr. Mathewson: I have only two or three questions on that line.

Mr. Burr: I object to it as not proper rebuttal.

Mr. Mathewson: I will say that I merely desire to show by the witness that there are two or three lamps of very much greater efficiency——

Mr. Kirby: And there are several gas lamps in the same way, and if you should bring in this we would have to bring in others, and where would we end?

Mr. Mathewson: If the Master is in doubt about it, I shall not press it. It seems pertinent to me.

The Master: At first blush to me it does not seem to be rebuttal evidence. I do not recall exactly what Professor Bemis testified to, but it may be you are quite right, and that there is some specific fact to which he testified that you may rebut.

5840 Mr. Burr: I assume it is the testimony of Dr. Marks and Professor Bemis, that the reduction in the price of gas invariably means increased consumption.

Mr. Mathewson: Yes, a very large increase, they have stated, and my purpose was to show that even if their assumption be correct as to the general theory, that there are discoveries which have been just made and devices made in the electric lighting business which would have a tendency to cut down the output of gas by the use of this cheaper electric lighting. That is exactly the point, but if the Master has doubt about it, I shall not press the question.

The Master: I am inclined to think that objection is good.

Mr. Mathewson: Very good, then I shall not press the question.

Q. Now, I will ask you whether you examined each one of these exhibits of wrought iron pipe offered during Mr. Maxwell's testimony?

A. I have.

Q. In addition to those which you have specified on the table this morning?

A. I have examined each one of them.

Q. And whether you found on each one of them pittings in your judgment due to electrolysis by currents from the elevated railroad?

A. The pittings and corroded condition of the pipes taken together with their location and the electrical readings taken from them indicated to my mind that the corrosion was at least to a large extent due to electrolysis derived from stray currents from the Manhattan Elevated Railroad.

Q. Generally, Professor, while the situation of electrolysis in New York until very recently has been more favorable than
5841 in many cities, I assume, what is your view as to the future danger of electrolysis by reason of the evidences which you have seen here as affecting the pipes of the Consolidated Gas Company?

Mr. BURR: I object to that as being too remote and speculative.

The MASTER: I will allow it.

Mr. BURR: Exception.

A. My opinion is that stray currents are now flowing from the elevated to the gas pipes, and off from them and that in the future they will continue to flow, and that some destruction is going on; whether that destruction is serious or not I do not know. You probably will not find out until the pipes are dug up, as they were in this case, and examined.

Q. What would be the tendency due to these increased currents and increased electrical construction to which reference has been made as to the New York, New Haven & Hartford and the New York Central and the subways?

A. They would increase the hazard from stray currents considerably.

Q. And would it be your view or not that damage is to be expected in the future for which provision must be made to a greater or less extent?

A. I do not think the damage can be prevented. I believe there is sure to be continual damage in the future.

Mr. MATHEWSON: That is all.

Cross-examination by **Mr. KIRBY**:

Q. I presume that you agree with Mr. Lieb that the Edison Company has been making and is to-day making efforts on
5842 their part to prevent stray currents from their curcuits?

A. It is my opinion that the Edison Company has, right from the beginning, had such an abundance of neutral copper in the ground that there never was any danger from stray currents, and I do not think that their improvements are made—or rather their additions of a neutral feeder are made for the purpose of preventing stray currents; they are simply for the purpose of making their system as effective as possible.

Q. And as a corollary to making their system as effective as possible, comes the fact that the danger from stray currents is minimized?

A. It does.

Q. Is it also not a fact that the elevated railway structure or those who control the elevated system are making efforts to-day to prevent stray currents from their structure?

A. They are making efforts inasmuch as they are substituting for the uninsulated connecting return cables at the sub-stations, insulated cables.

Q. And will this, in your opinion, improve the situation?

A. It will improve it.

Q. So that the condition in the future would be better than it is to-day?

A. The condition of the Manhattan elevated with the improvements indicated will be better in the future than it is to-day.

Q. And have been in the past?

A. And have been in the past; excepting, perhaps, in so far that the Manhattan may increase its capacity and therefore may be using larger currents, and also excepting this important point, that the Manhattan Elevated depends for the return of its current largely on the bonding of its structure and bonding of its rails; and when there bonds are new they make good contact as a rule, but as the bonds become old they are likely to deteriorate in their contact, and while they are now substituting insulated cables for the 5843 uninsulated ones at the substations, the bonding may, due to vibration of the structure and due to natural causes, become less efficient and therefore the structure itself and the rails themselves may become less efficient return conductors, and for that reason we might expect a larger increase in the stray currents.

Q. But this increase of current upon the structure itself, and decreased conductivity of the structure due to faulty bonding, is purely problematical, is it not?

A. Not at all problematical, in view of the fact that a large part at least of the electrolytic damage from single trolley railroads has in the past been due to poor bonding which was good at first and became defective through use. That has always been the experience.

Q. Take the increased use of current, have you any definite knowledge or information as to whether more current will be used in the future than is being used to-day?

A. No.

Q. Take the question of bonding, have you any information or knowledge as to whether or not those in control of the elevated railway system will not use their efforts to keep their bonding in good condition and repair?

A. I have no doubt they will use their best efforts, but even their best efforts will not enable them to locate defective bonds; it is a most difficult thing to locate, and there are so many in the elevated structure, it is, in my opinion, impossible to keep them all in effective condition.

Q. But the general conductivity of the whole structure can be kept up, can it not?

A. That is problematical; I don't know. It is a riveted structure with bonds, and whether or not the conductivity can be kept up or not is a question only time can decide. It is certainly nothing like as good a return as, for instance, we have in the subways, 5844 where a continuous copper return feeder is used—you could not compare the two.

Q. Then there is but little danger from the subway?

A. There is very much less danger from the subway than from the Manhattan elevated. How much danger there is from the subway nobody knows.

Q. That is also problematical?

A. That is in a sense problematical, yes.

Mr. **Mathewson**: Do you mean there would be less danger in the subway return than there would be in the elevated after they instal this new bonding system, or as it now is?

Mr. **Kirby**: I will ask him.

Q. The subway system is a continuous cable return, is it not?

A. In the subway system they have continuous cable returns attached to various points in the rail system and conducting the current back from those points. Whether or not all the current will return by those paths depends upon the potential differences which exist between the points in the subway which are grounded in the way I have described before. If those points can be kept at the same potential or substantially so, within one volt, I put that as the safe limit, if it can be kept within that limit, in my opinion there will be no currents which could be considered dangerous.

Q. And that is the intention and that will be the effort, will it not?

A. I don't know what their intention is.

Q. It is, in your opinion, a possible engineering result, to keep such points within the range of potentiality of which you speak, is it not?

A. It is an engineering possibility, but I do not know of a single case in this country where it is accomplished.

Q. It is accomplished in the Edison circuit, is it not?

5845 A. That is not a railway circuit. You must remember that in a railway circuit, all the current that is used has to return by the grounded conductor, whereas in the Edison system a very small fraction of all the current that is used is returned by the neutral grounded conductor and the mass of copper there employed is such that there will be no appreciable potential difference to do any damage.

Q. But in the subway system the return is by the rails and copper return cable, is it not?

A. Yes, but that does not say that all the current is going back by that path. For instance, suppose all the return cables were of the same cross section and one was a short cable and the other was a long cable, there would be still a potential difference between the ends of those cables, and if those ends should be grounded to the structure—whether they are or not at those points I don't know—but if they should be, there would be a stray current due to that cause.

Q. The reason, I presume, for grounding of the currents at certain points to the structure itself is to take advantage of the conductivity of the structure, is it not?

A. Not at all. The reason is to make it safe for workmen to work in the subway and prevent an electrostatic charge from making the rails at a higher potential than the ground. It is not at all for the purpose of making the structure the return. It was found necessary simply as a precautionary measure.

Q. Will you take up, if you will, the piece of pipe, I think it is Exhibit 324. Looking at that pipe I see it appears to be pitted along practically its whole length. Do I understand you to say that is all due to electrolytic action?

A. I did not say that. I said that the fact that the pipe was carrying current in the neighborhood of the Manhattan substa-
5846 tion in Spring Street, and that the pipe was positive to the ele-
vated pillar in that neighborhood, and the fact that these pittings—that pittings do occur which are of an electrolytic appearance —taking all these things together, I say it is conclusive evidence that at least a part of it is due to electrolysis.

Q. What would the other part be due to on that lead sheathed cable?

A. The effect of electric current when it passes from a metal into an electrolyte is to produce an acid condition and set up chemical action. Some of this may be due to secondary chemical action from that cause; I do not know.

Q. Have you made any analysis of the earth at that point?

A. I have not.

Q. Have you been informed, or do you know, whether there is any acidity at that point?

A. If there was no acidity there originally, the current would take good care to make it acid.

Q. You do not know, that is a conclusion?

A. I know that an electric current in the presence of salts, which are always found in the ground, such as chlorides, nitrates and sulphates, and the like, always produces an acid condition at the point where the current leaves the metal.

Q. Do you know whether or not there was an acid condition at that point where this pipe was taken from, and if so, how do you know it?

A. Not from tests, no.

Q. Then you are not prepared to say whether that was so or not?

A. I am prepared to state that if currents as is shown left the pipes at these points and went into the soil, the soil containing the usual salts, that acids were formed at these points.

Q. You don't know whether or not it contained the usual salts?

A. It always does.

Q. You are not prepared to say the soil did at this point, are you?

A. No.

5847 Q. You are not prepared to swear that it contained other
than the usual salts, are you? You do not know anything about what the chemical makeup of the soil was at that point?

A. I know nothing about the chemical makeup of the soil at that point.

Q. Am I to understand you that the current was leaving the entire length of that cable?

A. Yes.

Q. And that from one point to the end it has created a certain broken condition of the surface? Now, point out if you will, what is due to electrolytic action if you can, and what is due to other action?

A. I cannot point it out. Nobody can.

Q. Is there any point there at which you are more positive than the rest that it is due to electrolytic action?

A. Yes, we find from experience that when the corrosion is concentrated at local points producing pits or deep depressions, that that is the result of electrolysis, whereas the ordinary chemical actions produce a more uniform destruction. Further than that, if acids were present which would chemically act on that, they would all the more act electrochemically, that is, the current would act worse in the presence of acids and make the conditions tremendously worse than they would without.

Q. And where we have this acidity in the earth or salts, am I to understand that there may be electrolytic action without any flow of current to or from that point from an outside source?

A. Why, no, I did not say that. I said that from the evidence presented, the current was leaving this pipe.

Q. Yes, but I am not speaking of the evidence presented; I am speaking of this little electrical action which you have spoken of which might be produced when there was acid or salts present. I am asking if that is a condition which might obtain, and if electrolytic action might take place without there being any current to start up that action, such current coming from an outside source. 5848

A. I do not understand your question.

Q. We will assume we have this condition, which you have made reference to, where we have an acid earth.

A. Yes.

Q. Suppose we had two metals in that earth, could there be electrolytic action set up between those two, that is, could a battery be made?

A. Oh, yes, that is possible if the conditions were just right. If you had two metals which were so located with reference to each other in this acid earth as to produce galvanic action, that could certainly be produced, yes.

Q. What was this pipe lying next to, do you know?

A. Well, it was drawn out of a subway duct, which, as I remember it, was iron; it may possibly have been tile. I do not recollect at the moment.

Q. What would be between this lead-sheathed pipe and this iron or tile duct?

A. Probably some water.

Q. Well, then, do you know whether it was water or not?

A. I do not.

Q. Is water supposed to be present there?

A. It is not supposed to be, but it gets in.

Q. Suppose it was not there, could such corrosion take place?

A. No.

Q. Then would you say that is due to the decomposition of water and electrolytic action set up by the water that this pitting is present?

A. I did not say that. It is not the decomposition of water that makes it, it is the salts held in solution by the water to which is due the damage. I should say that certainly there was a solution of some kind, something wet between this and the duct, in which it was lying, without a doubt.

Q. It could not be produced in any other way, you think?

A. If the ducts were perfectly dry and this were lying in perfect contact I do not believe it could be produced, no.

5849 Q. The duct is intended to be dry, is it not?

A. It is intended to be dry, yes.

Q. Have you examined any service pipes or wrought iron pipes taken out of the city streets besides those which have been put in as exhibits?

A. I do not recall whether I have examined any taken out of the streets in New York. I have examined them in other places.

Q. If you have not examined them taken out of the streets of New York or out of the neighborhood from which these pipes came, how are you prepared to state that the rust on these pipes has been largely increased by electrolytic action? What comparison have you to make so as to draw your conclusion?

A. I have the facts given in the testimony in regard to the electrical readings; that is, that these pipes were all positive to the elevated pillar; further than that, that the gas pipe, or rather the gas main, was actually carrying current leading up to this district where these pipes were removed. On one of these pipes (complainant's Exhibit 307) a flow of current was actually measured on the service pipe, Exhibit No. 7. The map, Exhibit 303, shows that on underground conductors generally in this neighborhood currents were flowing generally in the direction of the Manhattan sub-station. And all these things, taken together and taken together with the pittings and the corrosion that we observe, are as conclusive evidence as can be possibly obtained.

Q. That there is electrolytic action going on?

A. That there is electrolytic action going on.

Q. Yes, I quite understand your point in that regard, but that is not at all responsive to the question which I asked you.

A. I do not understand your question.

Q. My question is this, you have stated that rusting of
5850 these pipes is due, in your opinion, or has been increased, in
your opinion, by electrolytic action?

A. Yes.

Q. Now, you are not familiar with the soil there. You don't know whether it is an acid soil or what salts may be contained therein. You have not seen the pipes taken out of the ground from that point or even in the city. You have not observed rust thereon, to what extent it may be or has been, and still you give a conclusion as stated.

Now, I want to know upon what comparison you base your conclusion?

A. From the fact that any soil, so long as it is damp or wet, is an electrolytic conductor, and these service pipes were lying within a few feet of an elevated pillar and were positive to that pillar, before the ground was removed there was unquestionably a flow of current through that ground. There could not be anything else. Of course, when the ground was removed the flow of current was interrupted because the circuit through which the current was flowing was interrupted. It was therefore manifestly impossible to measure the current flowing on these pipes, for the reason the current was interrupted by taking the pipes out of the ground. The only reason we have is that there was damp ground between the two and a potential difference in the manner indicated.

Q. You never made any comparison of pipes lying in this ground which were not subjected to electrolytic action and pipes which had been, in your opinion?

A. In this ground, no.

Q. Or in any other ground in the city?

A. Not in this city, no.

Q. You have spoken of currents flowing along the pipes. How do you know it was flowing along the pipes?

A. They were measured and are shown on some of these exhibits.

5851 Q. Do you mean to say if you take and put an ammeter between a pipe and an elevated pillar and get a reading across, that there is current flowing on the pipe or to the elevated pillar?

A. No, sir, I did not say that.

Q. How do you come to your conclusion?

A. My conclusion is based not on that exhibit, but other exhibits.

Q. What exhibit?

A. I will show you.

Mr. MATHEWSON: Current flowing along the pipe, he said.

Mr. KIRBY: Well either one.

The WITNESS: Take, for instance, this same exhibit I had last (indicating). There is an actual current of .95 amperes flowing along that pipe. It was found by measuring the drop along the pipe, along a measured length of the pipe.

Q. Now, taking this Exhibit 307, you say it was found by measuring the drop along the pipe?

A. Yes.

Q. Will you kindly point out the point where that reading was taken and what it is and what other elements enter into your conclusion that there was current flowing along the pipe?

A. The electrical readings were taken by Mr. Maxwell, and he has testified that these electrical readings were taken by himself and were correct.

Q. That is all right. Now, what were the readings and where were they taken?

A. They were taken on Exhibit 307 on this particular pipe, as shown. Mr. Maxwell will have to answer that question as to exactly what point. It is quite immaterial, so far as this case is concerned.

Q. That is not it. I want you to do so, but you seem unable to point out where the readings were taken, what particular points and what they were and upon what elements you based your conclusion that there was currents flowing in that pipe? 5852

A. I based it upon this evidence here, Complainant's Exbitit 307. That states specifically on that exhibit the current flowing equals .95 amperes from the main towards the house, and this has been put in evidence by Mr. Maxwell, and he has testified that these readings are correct, and he is competent to make these measurements, and, therefore, I have a right to consider this is the current.

Q. You have just stated that this exhibit, coupled with Mr. Maxwell's testimony, is to the effect that the current flowing from the main towards the house is .95 amperes?

A. Yes.

Q. If I remember his testimony, it was to the effect that he put an ammeter across from the pipes to the elevated railroad pillar, or whatever it might happen to be?

A. No, that is a mistake.

Mr. Mathewson: That was another thing, that is where he got the difference in potential there.

Mr. Kirby: No, you do not read difference of potential with an ammeter.

Mr. Mathewson: Another place he testified about that.

Q. Then you cannot tell me from this exhibit and from the testimony which you have listened to how Mr. Maxwell got his result, which is set down there, can you?

A. I am simply taking these exhibits for what they are.

Q. But you cannot tell me and answer my question from this exhibit and from Mr. Maxwell's testimony which you were here and listened to, how he got his conclusion that there was .95 amperes along that pipe?

A. I cannot answer it until I read over his testimony again. I do not remember whether he has testified in detail how he made this particular measurement, but I know he is perfectly competent to make such a measurement, and as long as he states that the current is .95 amperes, I take it he made it in the proper and correct way. 5853

Mr. Mathewson: He stated those were the correct electrical readings.

Q. Now, I show you Complainant's Exhibit 322, and call your attention to the statement thereon, as follows: Pipe connected to L pillar through an ammeter, pipe positive 90 amperes, 2.2 volts; pipe negative 10 amperes, .8 volts. Do you mean to say that reading with an ammeter in that way means a flow of current from the pipe to the elevated railroad pillar?

A. No.

Q. It simply means that when an ammeter which carries a conducting wire from the pipe to the ammeter which in itself is a conductor, and then to the pillar, in other words, when an ammeter is interposed between the pipe and pillar, there is a flow of amperes indicated.

A. It means more than that.

Q. It means that and more?

A. Yes.

Q. But it means that?

A. Yes, and I would like to explain what it means more, if I may.

Q. I think I understand what it means more. I have no objection to your explaining it, if you want to.

A. I would like to explain. If there was simply a high resistence connection between the gas pipes and elevated structure at some point, we might get a potential reading, but when we put an ammeter across we would not get any considerable current. The fact that we would get a considerable current in an ammeter connected between the pipe and elevated pillar indicates that there is a contact somewhere else between that pipe and the elevated pillar, and, therefore, it indicates that we have not merely an electrostatic potential, 5854 but we have a condition which is most favorable for the flow of current.

Q. As a matter of fact, there are risers which go up from most of these gas mains, to most of the elevated stations onto the structure itself, are they not?

A. Yes.

Q. That would be an excellent contact, would it not?

A. Yes.

Q. Far better than the flow of current through the earth?

A. That is comparative. I could not answer that question.

Q. Most things are by comparison. The result of all your testimony is by comparison and deduction?

A. Yes, in general, I should say very much better.

Q. We have looked at this piece of lead pipe and the pittings in it. Do you think that if, instead of the lead pipe occupying the position which this one did, Exhibit 324, it had been wrought iron pipe that the evidences of electrolytic action would have been practically the same?

A. Not quite, because the rate of corrosion of lead is about three times that of wrought iron; that is to say, a given time and a given current will remove three times as much lead as it will iron.

Q. But is the evidence, that is, the marking in one characteristic of that in the other, or do they differ, and if so, how do they differ?

A. I do not believe there is a substantial difference.

Q. You do not believe there is?

A. I do not believe there is a substantial difference.

Q. So that if a wrought iron pipe was subjected to an electrolytic action of the same intensity as a lead pipe or sheath covering of a cable and the time for the wrought iron pipe was three times that for the lead, you would expect to see practically the same result?

A. Under ordinary conditions, yes.

5855 Q. Is there any method by which, after a lead cable or wrought iron pipe has been removed from electrolytic corrosion, you can tell whether the corrosion has been recent or a long time removed?

A. Not that I know of.

Q. After a wrought iron pipe has been subjected to electrolytic action in the soil, I take it that it immediately becomes rusted at that point, does it not?

—. Well, the electrolytic corrosion is a form of rusting; it is a very broad term, rusting.

Q. If you subject, for instance, either lead or say, wrought iron particularly to electrolytic action, such action as would be damaging, which I take it is the current flowing away from the pipe, there is a deposit being taken from the pipe to something else instead of a deposit being made on the pipe, and you broke your current and looked at the pipe you would find it brightened where the electrolytic action was taking place, would you not?

A. Do you mean at a point where the current left the pipe?

Q. Yes.

A. Find it brightened?

Q. Yes, the pipe would look clean and new?

A. No.

Q. How would it look?

A. Rusty.

Q. What would rust it?

A. The acids produced by electrolysis.

Q. The acids would immediately attack it and rust it?

A. Yes.

Q. While the electrolytic action was going on, however, there would be no rust present, would there?

A. Rust is a broad term, and includes all erosion.

Q. The place would look bright and clean?

A. That is a hypothetical question, Mr. Kirby, which I cannot positively answer. I do not believe anybody knows.

5856 Q. Then we will go on a little further, and our electrolytic action is either going on or has stopped and, as you state, corrosion takes place and the point becomes rusted. You would dig your pipe up and it looks also rusty. Suppose that pipe had been subjected to electrolytic action ten years ago and it had stopped, and you took it up today, could you tell the difference in appearance between that pipe and one which you took up yesterday?

A. No, sir.

Q. And in which the electrolytic action had been present the day before yesterday?

A. No, sir.

Q. Now, coming to this pipe here, Complainant's Exhibit 320-A, about which we have had some testimony as to current leaving from the various sides thereof, I want to know if you agree with Mr. Maxwell that these various points are due to electrolytic action? Here is a hole right through it. I think it is the only hole through the pipe. You think that is due to electrolytic corrosion, don't you?

A. Looking at the pipe just by itself, and only showing what is shown there, I would not be willing to form any conclusion whatever as to the cause of that corrosion; but only when we consider the relation of the pipe to its position in the ground and the electrical reading taken thereof, all that taken together is evidence that it is electrolytic corrosion, but not the appearance of the pipe itself; but it is a fact which we get from general experience that electrolytic corrosion produces marked pittings, which are rather different in appearance from the ordinary corrosion that takes place in the ground, and such pittings I have examined in many instances, and they are characteristic. But I would not be willing to swear that a given pitting taken by itself and without any other evidence was a sufficient proof of electrolysis.

Q. In other words, it might be due to ordinary chemical action, such as rusting, or if there were more acid in the earth, due to more energetic chemical action?

A. I should say I did not know.

5857 Q. So you are not prepared then to take up any one of these pipes, except possibly this lead cable, and swear that examining them by themselves you would say that the pitting and rusting and other evidence of deterioration thereon was due to electrolytic corrosion, are you?

A. I would say that these exhibit pipes in many instances show the pittings which are characteristic, strongly characteristic, of electrolysis, but I would not be willing to swear that from the appearance of the pipe itself we could substantially say it was electrolysis.

Q. Let us take complainant's Exhibit 328, and point out to me, if you will, the pittings which are to you strongly characteristic of electrolytic action. That is what I want to see.

A. Well, this pitting in which there is a hole, this pitting over here, around which there is a long blotch (indicating).

Q. Let us mark them. Now, the one I have marked with a ring around it in lead pencil?

A. Yes.

Q. Now, how about this on this side (indicating)?

A. I don't know anything about them, the evidence is not good enough there to make anything positive at all.

Q. How about this one?

A. I don't know.

Q. Or this one?

A. I don't know.

Q. Well, we have two on which you feel quite positive?

A. No, I am not so positive about either of them as evidence in itself.

Q. But they are strongly characteristic of electrolysis?

A. They are strongly characteristic of electrolysis, but not so strong as some of the other exhibits.

Q. Let us take some of the other exhibits. If you will hand me that short piece of pipe over which we had some somersaults flying around Saturday. Take this pipe, 320-B, what strongly 5858 characteristic evidence of the electrolytic corrosion do you see on that?

A. I do not think there is any very strong evidence of what I would say, in itself and taken by itself, was evidence of electrolytic corrosion, no.

Q. Now, if I may have Mr. Mathewson's diagram, Exhibit 325. Turning for a moment to that exhibit, which has some three points marked thereon, am I to understand from your testimony that current from the point A would by preference take the path of the earth to the elevated pillar, rather than flowing through the iron pipe itself and leaving by point B?

A. I did not say so. But let us suppose, for instance, that there is a rock between the pipe and the pillar, in between here (indicating), then certainly the path from A over to the pillar, or from C over to the pillar, is better than B to the pillar.

Q. But point B being the point facing the pillar has been testified to by Mr. Maxwell as being the point where the electrolytic pitting took place.

A. That would be, under ordinary conditions, the place where the worst pitting would take place. It does not follow that all the pitting would take place there. It is my opinion that electrolytic corrosion and pitting go together, you cannot separate them. And it is my strong opinion that this corrosion from electrolysis is taking place all over there. The reason we get pitting, as that is understood today, is that at some point in the pipe or other there is a better conduction to the ground, and therefore a strongly localized current, and it is for that reason that the chemical action at that point is concentrated and aggravated and therefore produces a stronger and deeper pit than it does more uniformly.

Q. Well, let us look at Exhibit 324 again. Do you find any evidence of that current leaving, except from one side?

A. No, sir.

5859 Q. Would you agree with Mr. Maxwell that one of the strong evidences of electrolytic corrosion in the pipe would be the pittings along the straight line running parallel with the pipe, or rather not twisted around the pipe, but running down its length?

A. I would expect to find the greatest electrolytic destruction at the point nearest to the pillar, provided, of course, that the ground around here was uniform. There may be a wall between however and a dozen reasons why the path is better from some other spot.

Q. And the earth is generally other than uniform, there are stones and pebbles and things like that in it?

A. Yes.

Q. So we could expect to see current come from any and all parts?

A. Yes.

Q. And that being so, the pittings would not be in a regular straight line, but from everywhere?

A. Not as a rule, if they were in the ground, no. But this lead pipe was in a different condition, it was not in the ground, but was resting in a duct, and therefore was making contact at the bottom and not along other points.

By Mr. Mathewson:

Q. And the lines are where it was making a contact with the duct?

A. Yes. I have explained that already.

By Mr. Kirby:

Q. In this pipe shown in Exhibit 325 the distance between point A and the pillar and point B and the pillar, as far as the relative conductivity of those two paths is concerned, is infinitesimal, is it not? Take these pipes here, they are one inch pipe and two-inch pipe——

A. Yes, but the fact is this——

5860 Q. Well, that is so, is it not, it is infinitesimal, if you measure the conductivity of the earth between A and the elevated pillar and between B and the elevated pillar?

A. Yes, but that is not what counts. It is the surface contact with the ground and not the conductivity of the earth itself.

Q. So that if you had your good surface contact at A with the pillar you might have almost all your current leaving at that point as against B where the surface contact was poor?

A. Under that assumption yes, although I ordinarily would not expect it so, for this reason, too, that the effect of the current in the electrolization of the iron, increases the conducting path, so that once the action is started it is aggravated at that point and continues by preference at that point rather than at any others.

Q. But if we had this pipe buried in uniform earth and each point of the surface insured equal contact with the earth and a difference of potential between that pipe and the elevated pillar, we would expect to find the current, if there was a flow of current, leading from the point B and going to the elevated pillar, would we not?

A. The current would leave from all points, but the largest amount of the current would flow from the point B, or in the immediate vicinity of that point, but some current would flow from all points.

Q. The larger amount would mean almost the entire amount, would it not?

A. Probably, yes.

Q. So then, to have an appreciable current flowing from any other point you would have to have a poor contact of the pipe with the earth at some point or a non-conductor like a pebble, or something of that kind resting against the pipe, or some unusual condition?

A. Yes.

Q. When this pipe was taken up I do not suppose you were present?

A. No.

5861 Q. You are not aware of the nature of the ground, whether any gas pipes, or any other things were in the soil at that point?

A. No.

Q. If there had been an acid condition of the moisture, which you state must have been present in that tube in which the lead pipe was drawn, I suppose that might have produced that result?

A. It would facilitate electrochemical action even more than chemical.

Q. If there was no current?

A. It might.

Q. It might, might it not?

A. Possibly.

Q. You have spoken of the law of divided currents. The law of divided currents is what Mr. Mathewson is pleased to speak of an Ohm's law, is it not?

A. It is an application of Ohm's law.

Q. By that you mean that no matter how bad a conductor anything may be, and how low a potential there may be, that nevertheless there is a part of the current which goes through that conductor as compared with some other?

A. Yes.

Q. When we come to the Edison circuit, we find that this neutral is such a good conductor that notwithstanding the fact that the earth, which is a poorer conductor, is also present as a return, that the current almost in its entire amount returns by the neutral rather than by the earth?

A. That is so.

Q. So that while the law of divided current applies, it practically means that where we have the earth, a poor conductor under circumstances such as I have suggested, it carries a current which can be disregarded?

A. Not exactly, Mr. Kirby. We have another element to consider in this connection, and that is the counter-electromotive force, which is produced when a current enters a pipe and leaves a pipe. There is some counter-electromotive force.

Q. We have it when it enters or leaves a cable in the same way, don't we?

A. What do you mean by cable?

5862 Q. I mean copper.

A. Oh, no, it is due to electrolysis, and that prevents any voltage which is much below, say, half a volt, of producing any current which would be at all measurable from flowing on to and off the pipe.

Q. So, as a matter of fact, it would be easier for a current to stray from a copper cable than it would to stray from a lead or iron pipe?

A. No, not at all.

Q. They would be both the same?

A. Yes.

Q. That is what I tried to bring out and you seemed to disagree with it?

A. No, I don't believe you understand me yet.

Q. Yes, I think I do.

A. I hope you do.

Q. This balancing of the Edison circuit is one which every effort is made to bring about, is it not?

A. Yes.

Q. And is it done mechanically?

A. Mechanically?

Q. Yes.

A. You would have to explain what you mean by that.

Q. How is the circuit kept within balance?

A. All current due to the installation of lamps and other devices, is as nearly as is possible balanced between positive and neutral and negative and neutral.

Q. And as long as that condition prevails there is no danger of flow from one neutral to another, the potentiality of the two is practically the same?

A. Yes.

Q. Now, you have stated that this neutral is grounded?

A. It is.

Q. Grounded to take care of unusual conditions which may exist?

A. It is.

Q. I suppose the throwing out of a certain number of large office buildings suddenly by the breaking of a cable or some unfor-seen accident would throw the system out of balance for the time being?

5863 A. No, sir, because every office building in the city that I know of is wired on the three-wire plan, and it would not disturb the balance of the system in the least.

Q. Well, then, what are these hazards of which you spoke?

A. I will give you some instances. Suppose this system was not grounded and a man in his residence had a lamp cord and that cord on one side came in contact with the ground; a ground would be established on that side of the circuit and nothing particular would happen. Now, suppose that the same man or some other man in some other house came in contact with the other side of the circuit, he would receive a shock of 240 volts, and if on the other side of the circuit an accidental ground connection were made, there would be a serious short circuit due to the 240 volts. On the other hand, if the Edison neutral is grounded as thoroughly as it is, as soon as the first man gets a ground by one of his lampcords coming in contact with the ground, and the fuse automatically breaks open that circuit and the dangerous position is immediately thrown off the circuit automatically, and it further makes it impossible for anyone standing on the ground and coming in contact with either wire, of receiving a voltage greater than 120, whereas in the other case he would receive 240. You make a service continuous and safe by grounding of the Edison neutral wire.

Q. Have they not somewhat the same reasons as the subway as to being grounded?

A. Somewhat the same reasons, yes.

Q. Now, when this circuit is thrown out of balance there is a difference of potential set up between the neutral wires, is there not?

A. Of course, in order that the current may flow through the neutral wires there must be a difference of potential to make
5864 it flow, but that difference of potential would in all cases be a fraction of a volt.

Q. And according to the law of divided circuits there would be a current flowing?

A. Not an appreciable current through the ground.

Q. But a current?

A. Because if the circuit which includes the ground pipes and with which pipes again we have to deal, this counter motive force would be there and therefore the current electro would be of the character of ordinary earth currents.

Q. You have never made any measurements in the city or had any measurements made to ascertain whether there was any difference in potential between the grounded neutrals of the Edison system, have you?

A. I have made over one hundred measurements myself.

Q. Have you found any such difference of potential?

A. The average of the maximum potential that I found was about .4 of a volt and those were under the worst conditions possible.

Q. How high did you find any of them going?

A. I cannot say how high I found any potential difference due purely to the Edison neutral system, because the grounded ends of the neutrals partake of the potential of the ground due to all causes, and when I had, for instance, one terminal near the elevated structure at one side and the other terminal near the elevated structure somewhat off at a distance I found the highest potential difference of 1.3 volts momentarily. I traced in one or two cases however railroad currents.

Q. I suppose you are willing to agree with Mr. Lieb that it is possible to ascertain whether or not these currents do come from the Edison system?

A. Your question is too broad to answer.

Q. Assume that you found a difference of potental between say
a gas main and a street railroad rail or any other point in the
5865 city's streets, is it possible for you to ascertain whether or not
that difference of potential comes from the Edison system?

A. I think so, yes.

Q. The charts 301 and 302 do not show any differences of potential as late as I may say these pipes were removed, do they?

A. Well, the last chart was taken in 1903, and these samples were removed in the past year.

Q. So I understood. You have made reference in your direct examination to the answer of Sever (Record, p. 3941). I will ask you to listen to me read the question and the answer, and ask you to state the reasons which led to the conclusion which you have already given.

"Q. And it is your testimony that if there be stray currents in the ground, such currents would follow such continuous paths rather than water pipes and gas mains which afforded a more broken path and a path of higher resistance? A. Yes."

Q. Now, do I understand from your testimony that if there were interposed for the transferring of electric current a continuous lead sheath of a cable, whether for power or telegraph or telephone work, and a pipe joined every few feet that the current would by preference take the broken path of the pipe rather than the continuous path of the lead-covered cable?

A. The current would divide itelf in proportion to the conductivities in every single case. The fact that the pipe is divided by joints makes its total resistance, of course, higher than if not so divided. On the other hand, the pipe is buried in the ground surrounded by moisture. There is, therefore, a conducting path around
each joint, and for that reason and also for the reason that gas
5866 pipes have very much larger cross-sections than cable sheaths,
some current will flow along the gas pipes.

Q. But this surface contact resistance, which you have already spoken of, comes into play at every joint, does it not?

A. The surface and the resistance is a very variable element, and it is sometimes very high, at other times very low, or it varies in one case. I have seen pipes where consecutive joints were destroyed on the positive side thereof; the current left and jumped over each joint, the joints being of high resistance.

Q. That is not an unusual condition, is it?

A. It is not unusual, although not very common.

Q. Now, I also turn to page 3038, and as to the testimony there you also made certain criticisms of Dr. Sever's testimony. Dr. Sever stated as follows:

"Q. Mr. Mathewson has spoken of the installation now being put upon the lines of the New York Central and the New York, New Haven & Hartford road, and you have stated that you are familiar with the installation which is being constructed. In your opinion, is there any great danger of stray currents from the power which would be furnished over this installation? A. That is on the New York Central installation.

"Q. The New York Central installation and the New York, New Haven & Hartford, both of which have been referred to? A. I do not consider that in the case of the New York, New Haven & Hartford there is sufficient proof or evidence that there will be any trouble from the alternating current system. The plans developed for the handling of the return current on the New York Central, as
at first made, I feel are not sufficient to handle the return cur-
5867 rent, but this is now being modified so as to increase the ca-
pacity for taking care of this negative current and the endeavor being made to keep the stray currents out of the sub-surface conductors and off the cable sheaths."

Is that in any way contrary to your conclusions upon the same system?

A. No, except that, as I have already stated, that the New York, New Haven & Hartford, in common with the New York Central, uses direct current and not alternating current from Woodlawn in.

Q. Now turn to page 3935, on the top of the page, and I read as follows:

"Q. What did you mean exactly when you said that they had already commenced to put the Manhattan Elevated return system on the same basis as the subway? A. I meant that they are putting in return feeders and insulating these return feeders carefully from the structure and service rails and insulating the negative bus in the sub-stations in the effort to keep the current on those return conductors and away from the ground; that is, providing a better path than would be provided through the ground back to the structure and the sub-station."

Does that differ in any way from your conclusion upon the subject in hand?

A. It does. I do not understand that they are putting in any return feeders whatever. What they are doing is to substitute for the uninsulated connections at the sub-stations and the structure, insulated ones, but not return feeders in the sense that there are any copper conductors paralleling the structure and serving to return current along the structure.

5868 Q. That is, they are insulating the negative bus in the station from the ground?

A. In the station, yes; but inasmuch as the negative bus at the station is connected with the structure and the structure is grounded we have a ground connection right at that point and at every pillar along the structure.

Q. But the return cable from the bus to the structure or from the structure to the bus is being insulated, whereas formerly it was bare?

A. Yes.

Q. And that is for the purpose of confining the current to the cable and preventing any from straying therefrom?

A. It is for that purpose, yes.

Q. On page 3913 of the record Prof. Sever has stated, in answer to a question:

"A. Every effort should be made by operating companies to keep the current on their own property, their own paths of conduction, to diminish their own loss, and to prevent trouble with other systems, other properties."

Do you agree with that statement?

A. Why, yes.

Q. Now, you say that answer implies something. What implication do you give to it?

A. Well, the question asks whether the stray currents do not mean a loss of energy and therefore a loss of coal and therefore a loss of dollars and cents, and I had reference to that. They must make every effort to keep the current on their own property because they would have loss from electrolysis of their own cables, for instance.

Q. Then I take it from your answer that it does not mean a loss of energy or a loss of coal if the current strayed?

A. It is a saving in coal and a saving in energy if the system is so grounded that a considerable part of the current returns by way of the ground, and not a loss. I gave an instance in my direct 5869 examination: for instance, if the Manhattan Elevated were perfectly insulated and the current in returning experienced a drop of voltage corresponding to a loss of 10 per cent. in energy, and that on the other hand it was so thoroughly grounded, that one half of the current returned by way of the ground, we would reduce our loss to 5 per cent. and therefore we would save 5 per cent. of energy and coal.

Q. Well, that would simply mean, would it not, that any company which would have a condition of that kind would be taking advantage of return systems of other companies which might be in the ground?

A. They certainly would.

Q. Is that an effort which is being made by the various companies using or supplying power in the city?

A. Not an effort by the companies supplying power in the city, no. They are incidentally doing it in some cases, however.

Q. And trying to stop it in other instances?

A. They are making some efforts that have been described to minimize it, but that won't stop it.

Q. And never have been able to stop it?

A. Never will be able to stop it.

Q. And never have been able to stop it?

A. The Manhattan Elevated has only been in operation a few years. It is my opinion they never will stop it entirely, and it is also my opinion that the methods they are adopting now will not entirely stop it, for the reasons I have already stated.

By Mr. **Mathewson**:

Q. You mean it has been in operation electrically only a few years?

A. Electrically I mean, of course.

5870 By Mr. **Kirby**:

Q. These experiments which you have spoken of as having been made by you, were they laboratory experiments?

A. I have made both laboratory experiments and I have made electrolytic tests out in the ground in Jersey.

Q. You haven't made any tests here in the city?

A. I have made tests in the city, measuring potential differences between the Manhattan Elevated and the——

Q. (Interrupting.) But you never made any electrolytic tests?

A. Yes, electrolytic tests.

Q. You never made any tests upon electrolytic action in itself?

A. I don't know what you mean by that.

Q. Well, you have made laboratory tests where electrolytic action has been set up, and where you observed the form of electric current and the deposit of the electrolyte?

A. Yes.

Q. Have you ever made any such tests outside of the laboratory?

A. No.

Q. Not even in Jersey soil?

A. I have made measurements on pipes and so forth as I dug them from the Jersey soil.

Q. And such would or might not show a flow of current?

A. They did show a considerable flow of current and pittings.

Q. And from that you would make deductions as to whether or not those pittings were due to electrolytic action?

A. Decidedly.

Q. Would you make analysis of the soil at the same time to ascertain what the change would be in that soil, or what it was originally?

A. I did not make such analyses, no.

Q. And wouldn't you consider it an advisable thing to do in substantiation of your conclusions as to what electrolytic action would do? 5871

A. It is perhaps advisable, but not at all necessary.

Q. As a matter of fact, isn't it customary in conducting such experiments to very carefully analyze the soil or test it for its acids, or to see what salts may be in it, both before and after?

A. Not at all in the ordinary experiments.

Q. But where making experiments to come to a positive conclusion, wouldn't you consider it advisable?

A. I did do it in my laboratory experiments.

Q. But you did not carry such refinements to the experiments made outside of your laboratory?

A. No, sir.

Q. Isn't it customary to carry those refinements into all experiments of this nature?

A. No, sir.

Q. You would not consider it better practice to so do?

A. I should consider it better practice, but it is not customary, for this reason, that the results obtained in thousands of soils that have shown uniformly and without exception that when a current leaves pipes for these soils we get electrolytic corrosion, and very careful experiments made in Germany by this Commission of which I spoke, show that in all the soil they examined had this condition and constituency that when the current leaves we get destruction corresponding to the current.

Q. I do not think there is any question of disagreement on that point, but is it also not a fact that in these experiments which you have spoken about as having been made in Germany and accompanying the report as to the amount of current, the pittings and such, there is a report giving the chemical analyses of the earth in which the conductor was buried and the change which was due to the flow of current to that earth?

5872 A. The experiments were conducted on a very elaborate scale by Prof. Haber, of Carlsruhe. He made a large number of both chemical and electrochemical researches and they were embodied in this report, and I am familiar with the report.

Q. Then I am right, there were chemical analyses made?

A. Yes, in that particular case, but in this country I have examined hundreds of reports on electrolytic surveys, and I do not recall any at the present time in which analyses of the soil were given. It is not the customary thing at all.

Q. But probable in the future that such refinements will be used by you?

A. No. In view of the light that we have got on the subject from these very German experiments it is not necessary.

Q. But advisable. Now, you have spoken of your report to the Committee on Electrolysis of the American Gaslight Association. That is the same report to which I have made reference in the examination of Professor Sever?

A. Yes.

Q. I understand I am right in saying that you worked with, or Professor Sever worked with you, in that matter to some extent?

A. I called on Dr. Sever, who was very kind to me in opening up his entire electrolytic library, which is very extensive, and I copied down all the important articles, and promptly obtained copies myself, and then I went further, and saw a lot of other friends, and read over a lot more articles, and I got together everything that could be obtained from every possible source, because I wanted to make this report as complete and comprehensive as I could make it.

Q. Making use of such eminent experts and authorities as you could find?

A. Yes.

Q. Professor Sever included?

A. Yes, one of them; one of the important ones.

At 1:15 p. m. a recess was declared until 2:30 p. m.

5873 After Recess.

Albert F. Ganz resumes the stand for further examination.

Cross-examination by Mr. Burr:

Q. You say, Professor, that a neutral is grounded as a safety measure for the consumer. What do you mean by that exactly?

A. If the neutral were not grounded, then when an accidental ground occurred on one side of the system, the consumer standing on a grounded spot and coming in contact with the other side would receive a potential of 240 volts, whereas with a grounded neutral, the highest potential that any consumer can ever receive by coming in contact with either side of the circuit while standing on the ground, is 120; and further than that, as I have explained, by thoroughly and completely grounding the neutral and accidental ground which may be produced on the consumer's premises, can immediately correct itself by the safety fuse burning out when it occurs.

Q. In other words, it is a precautionary measure to prevent damage to the consumer, or to his property, is it not?

A. And also to protect the service mains in the street, and so assure continuity of service, yes. In addition to that, I might add that if the neutral were not grounded and by some accident one side of the circuit should come in contact with the neutral conductor, then the double voltage would be thrown onto the one side of the circuit with disastrous results.

Q. Does electrolysis affect only mains and services?

A. Electrolysis will affect any and every metal from which current passes to the ground.

5874 Q. So that a person living alongside of the elevated railroad whose property was affected by electrolysis would be able to trace it to the source from which it came?

A. He would not necessarily be able to trace it to the source from which it came, no.

Q. Why not?

A. Because it takes rather elaborate instruments, in some instances, to trace a current. Currents are not in themselves traced, they do not carry any characteristics, and it takes several experiments to determine where they come from.

Q. Very true, and by those experiments you located these stray currents affecting as you claim the service pipes which have been offered in evidence here, to the substations of the elevated railroad?

A. Yes, sir.

Q. Now, with the same experiments a person residing along the line of a railroad whose property was affected or injured through this electrolysis would be able to trace it to the same source?

A. Not so easily, because the substation of the elevated is the centre to which all the current emanating from that substation must return, whereas a person living alongside of the structure itself does not live in such a favorable locality for receiving stray currents.

Q. I understood you to say this morning that electrolysis not only would be found along the line of where the subway was constructed, but in other streets where it was not constructed?

A. I made no such statement, at least not in the terms you have used. If you will refer to my testimony and tell me where I made such a statement I will explain it.

Q. When were you detailed by the Consolidated Gas Company to make the investigation of the effect of electrolysis on the mains and services?

A. On December 24, 1906.

5875 Q. Have you ever made any investigations for them prior to that?

A. Not on behalf of the Consolidated Gas Company, no.

Q. But you had on behalf of the Edison Company?

A. I had been conducting experiments not especially with that in view, but for other purposes for the Edison Company. I was retained last summer by the Edison Company to make certain other investigations in connection with their waterside plants; that involved making tests of this character at that point.

Q. From my notes I see that you stated that the effects as shown on these pipes to which reference was made and your attention especially called this morning, were due to the installation of elecictrity by the Manhattan Railway, and this was true even on streets where the L-road does not run, do you recall making that statement?

A. I do; and that particular street is the street on which the substation is situated, and, therefore, in greater danger; pipes in that street are in greater danger than pipes in many other parts of the city adjacent to the L structure. It was one of the most dangerous spots in the city.

Q. Had you had any experience with the mains or services of the Consolidated Gas Company or any gas company in the City of New York prior to the investigation which you made on the 24th of December?

A. No, sir.

Q. Do you know that there are mains and services in the streets of the City of New York which have been there for a period of fifty to seventy-five years?

A. I have heard such statements made.

Q. You heard Mr. Maxwell say, with regard to these particular pipes or services, that they were in his opinion extremely old pipes; do you agree with that statement?

A. I don't know.

Q. In fact, you cannot say whether they are forty, fifty or seventy years old?

A. I cannot.

5876 Q. Do you know how long it is since the electrification of the L road in the City of New York?

A. Yes, sir.

Q. How many years ago is it?

A. It was between 1902 and 1903, operation began somewhere in that time.

Q. Would you swear from a mere examination of these pipes produced in evidence that they were not in the same condition in the year 1900 as they are today?

A. You mean from the appearance of the pipes and nothing else?

Q. Yes.

A. I would not.

Q. You could not?

A. No.

Q. I think you said in reply to a question by Mr. Kirby that you did not know the character of the soil either from which they were taken?

A. Not specifically. I do know in general what the character of street soils is, and especially in New York, where it is generally known that salt is present.

Q. Well, I am speaking and having especial reference to these exhibits here.

A. No, sir.

Q. And you say that these service pipes brought here as exhibits were connected to the mains? Do you know that of your own knowledge or is that the result of the information given by Mr. Maxwell?

A. It is the result of the information given by Mr. Maxwell in his testimony.

Q. So that as I understand all that your testimony says and all that you mean to say is that in your opinion, and that opinion is based upon the readings and the maps here made by these other gentlemen, Mr. Varley and Mr. Maxwell, the pittings on the pipes produced here are as a result of electrolysis?

A. It was in part due to electrolysis, yes.

5877 Q. When you say that currents escaped from the L road through poor bonding, what do you mean exactly by that?

A. I mean that the L road depends upon its structure and the surface rails to bring the current back, and that if the bonding which unites the elements of the structure, is defective in any way then potential differences would be set up between parts of the structure and these parts, being grounded through the pillars, are thus able to set up stray currents to the ground.

Q. When you speak of poor bonding do you use it as synonymous with defective bonding?

A. By either poor or defective bonding I mean bondings in which the bonds do not properly connect the pieces electrically together.

Q. Well, that is due, is it not, to negligence or carelessness on the part of the people operating the L road?

A. Not necessarily. It may be due to accident. Vibration at a specific point may loosen the bond, and other natural causes may make a bond defective in its contact at such point.

Q. Can that accident be guarded against?

A. Not entirely, no.

Q. However, can it be provided for or guarded against?

A. Nobody knows.

Q. That is a pretty broad statement, "Nobody knows," Professor.

A. Well, I think it is true.

Q. Now is it or is it not a fact that water pipes are more liable to be affected by wandering electric currents than pipes containing gas?

A. It is not a fact.

Q. What is the difference?

A. No difference.

Q. That is, it will not affect the wataer pipe as much as it will the gas pipe, if there is no difference in the situation?

A. I did not say that. I said the pipes being otherwise equal, whether they contained gas or water it makes no difference substantially, perhaps with this one exception, that if a pitting is
5878 nearly through the pipe then the pressure of the water might
dislodge the remaining part of the iron and produce a leak, and that leak, of course, would wet the soil and make it a better conductor for the current to the works, whereas gas flowing through the mains at perhaps one-seventh of a pound pressure would not escape so readily and not impress itself so quickly, and it is for that reason that gas pipes may be undergoing a great deal of destruction before anybody knows it, whereas water pipes make themselves almost immediately known.

Q. This lead cable to which you have referred this morning, that is not placed in the ground, is it? It is placed, as I understand it, in a conduit?

A. In a tiled conduit.

Q. What is the object in placing it in the tiled conduit?

A. The object is to make it possible to withdraw the cable and substitute a new one when this becomes defective, and in general the object of tile construction is to have subterranean passages into which cables carrying conductors for electricity may be drawn or withdrawn at will, for the same reason that in modern house wiring we instal pipes and draw wires into those pipes. We do not have to tear up the street to replace the cable.

Q. It is stated in a work written by Hughes and O'Connor, entitled

Gas and Gasworks, published in London by Crosby, Lockwood & Son, in 1904, that the duration of mains depends entirely upon the soil in which they are laid. Does that conform to your opinion?

A. I should imagine that was so.

Q. Calling your attention to complainant's Exhibit 324, you say there is current along the length of the lead-covered cable?

A. I do.

Q. Now, when a draught of warm moisture-laden air in summer flows along the cooler interior of a buried duct, it deposits moisture, and if in addition manure dust and street dust enter the duct
5879 also, will not this solution of manure corrode and even pit the lead cable, without the aid of an electric current?

A. It might do so.

Q. Is it not a fact that white lead, carbonate of lead, is made by corroding common lead with manure, and is not this done without electricity?

A. I am not familiar with the process.

Q. Have you ever seen pitted pipes from breweries or ice manufacturing establishments?

A. No, sir.

Q. Do you know that boiler plates pit in the presence of the purest water?

A. I do.

Q. Do you know of any case of pitting where there could not be any extraneous current of electricity?

A. Well, boiler plates is an instance that you have just cited yourself.

Q. Outside of that?

A. I do not recall any.

Q. Can you say what pitting would have happened to these exhibits, assuming there was no extraneous electric current?

A. No, sir.

Q. Now, the gas mains of the Consolidated Gas Company are cast iron, are they not?

A. I understand they are.

Q. And the service pipes are wrought iron?

A. Yes.

Q. Is there not, in the presence of moisture, an amount of galvanic action between cast iron and wrought iron?

A. In the presence of moisture there is galvanic action between any two metails which are in any way different.

Q. That answers the question. I refer simply to cast iron and wrought iron?

A. A slight action.

Q. And this action may be caused by the junction of two metals with any damp material, may it not?

A. Yes, but these junctions have existed for all the ages.

Q. If there were salt or free acid in such moisture this action would be aided?

5880 A. It would, but so would the action of electric current be still more if aided.

Q. But you admit that the action would be aided if there were salt or free acid in such moisture?

A. Certainly I do.

Q. Is it not a fact if wrought iron and cast iron were joined by a drop of pure water there would be enough current passing from one to the other to deflect a galvanometer?

A. If the galvanometer were of sufficient sensitiveness, yes.

Q. And such galvanic action would produce electrolysis, would it not?

A. It would produce a slight amount of electrolysis, yes.

Q. Would it not produce the same pitting of the pipe as shown on these exhibits?

A. That is not the general experience, and I may say for this reason, that while, of course, electricity has been commercially used only for a comparatively few number of years, yet these galvanic currents of which you are speaking have existed as long as pipes have been in the ground, and any galvanic current which could be produced thereby have also existed long before we knew anything of electricity, and it was also a fact that we did not notice these pittings to any extent before we had these railroads straying currents into the pipe and producing the pitting.

Q. Is galvanic destruction of iron in pipe any different from electrolytic destruction of iron in such pipe?

A. Why, it is the same thing, of course.

Q. Exactly what action takes place when an iron pipe is destroyed by electrolysis?

A. The current in leaving the pipe and going to ground decomposes the salt present in the ground, forms an acid and the acid attacks the iron and forms again a salt; that same action is then continued, and it is for that reason that the electric current when it passes from a pipe to the ground produces this serious pitting, this 5881 serious corrosion, because the production of the electrolysis always reproduces the same conditions which are needed for this action.

Q. What becomes of the iron?

A. It goes into solution as oxide or chloride, or sulphide, or whatever compound, depending upon the nature of the soil in which the action takes place.

Q. Might not the condition of these pipes in evidence here be caused by galvanic action?

A. Galvanic action is electrolytic action; it is one and the same thing.

Q. Well, then it might have been caused by galvanic action?

A. The evidence in the case shows that currents were flowing along the gas pipes in this vicinity, that there was a potential difference between each service and the elevated pillar which was positive, and ground, which is always moist, was present between this elevated pillar and between these pipes and, therefore, a current must have flown, and therefore I can say positively that there was electrolytic action due to the stray currents.

Q. I am speaking of the appearance of the pipes themselves; you could not tell but what their present condition might have been caused through and from galvanic action?

A. I said this morning in my testimony that the pipes themselves, taken alone separately, are not sufficient evidence, although some of them show pittings which experience has taught are very characteristic of electrolytic pittings from stray currents.

—. The testimony is here that all the exhibits shown come from two square blocks. Does not this indicate a local condition for these two square blocks and not for the whole city?

A. The other evidence shows that this vicinity has decidedly a local condition caused by the stray currents from the Manhattan Elevated Railroad.

Mr. Burr: That is all.

5882 Cross-examination by Mr. Kirby:

Q. Wherein do electrolytic pittings from stray currents differ from electrolytic pittings which may set up from and are formed by the pipe as one of the elements, and some other pipe or substance as another element, and the moist earth in between as the electrolyte; wherein would the pittings differ in one case from the other?

A. In degree; because the electromotive force which could possibly be set up between the pipes as mentioned would be so low it could not produce in my opinion the serious pittings we find when stray currents due to variable voltage——

Q. But the characteristic marking in one is identical with that in the other?

A. One would naturally expect them to be the same, and yet——

Q. Well, they are the same?

A. I don't know that they are. I notice that the experience has shown that when corrosion is produced by stray currents we have decided pittings, whereas the ordinary corrosion in pipes due from moisture while undoubtedly due to some galvanic action, does not show such pittings and it is only due to the fact that stray currents flowing at comparatively high voltage produce a greater intensity at the point where they leave the pipe.

Q. Would the pittings be deeper in one point than the other?

A. No, though generally they would be deeper with stray currents.

Q. If we had no stray currents, but if there remained the local galvanic action for a couple of years it might be the same depth, might they not?

A. If you assume that during all that time the current left from the same spot and there was no change in that——

Q. Assume that.

A. Yes, of course.

Q. So, as a matter of fact, no matter what the source is, 5883 the result produced has the same general characteristic?

A. It may have, yes.

Q. Now, you have said that since the use of electricity has come into effect the pittings and destruction due to the electrolytic causes were such as they had never been before. What experience have you had in the examination of pipes buried in the ground which would lead you to make such a statement?

A. The experience gained by examining several hundred reports, and examinations of others made in this country, in England, in Germany, and made in my capacity as consulting engineer for the Electrolysis Commission of the American Gaslight Association. In addition to that I have examined probably one hundred or more—several hundred pipes myself at different times in order to familiarize myself with conditions. I made all these investigations of other reports so as to get a broad view of the situation and see—learn what the effects were not only in this vicinity but in all other vicinities.

Q. Didn't you read in those reports that pipes had been entirely destroyed where there had been no outside source of electric current at all?

A. Oh, yes, they may be so destroyed. In fact, I know that in the direct vicinity of gas works they sometimes are destroyed, due to the local condition which existed in such places, and may be also destroyed in other localities where there are some conditions favorable thereto.

Q. Did you read the Report of Investigations made in the City of New Orleans in 1869-1870-1871 to the effect that entire services had been destroyed where, and at that time, there was no other source of electricity in the City outside of galvanic action which might have been set up entirely locally between the pipe and the surrounding substances?

5884 A. I do not remember reading such a report, but you are speaking of the services being destroyed, and I have not claimed at all that in my experience such services and mains are not destroyed by ordinary chemical action. I have only claimed that these peculiar pittings are not as a rule found.

Q. By ordinary chemical action do you mean action which differs from that which would result in galvanic action set up between the pipe and some other substance, with the earth or moist soil or whatever it might be as the electrolyte?

A. The two actions go right into each other. Electro-chemistry and chemistry are not divided by any sharp line.

Q. So you would not be able to say whether it was a real chemical action, an actual subject of loss?

A. No.

Q. Or that it would be combined with electro-chemical action or merely electro-chemical action by itself?

A. No.

Q. It might be one or all?

A. Yes.

Q. And that it might pit or be partially destroyed or entirely destroyed dependent upon the intensity of the current and the local conditions.

A. Yes, but it has been the general experience that this peculiar pitting is only found where there are stray currents.

Q. Well, before the use of electricity was had, was not such pitting observed in pipes?

A. Only in very rare instances, not as customarily as observed now when we have stray currents. Such rare instances were undoubtedly due to the local action in which currents were actually got up in some way or another.

Q. Those might be set up by the pipes and some other substance forming a battery, and the soil being the electrolyte?

A. Yes, under extraordinary circumstances, yes.

5885 Q. The elevated road, as you have stated, is making considerable effort to bond its rails and members of the structure. I pressume that the up-keep of such system would be part of its maintenance, would it not?

Mr. Mathewson: Is that pertinent? Does it make any difference whether they charge it to capital or maintenance?

Mr. Kirby: I think so.

Question allowed. Exception.

A. They are not making any particular effort at the present time or have not made any particular effort since the road was first electrified to improve the bonding to my knowledge. The bonding was installed when the system was electrified as part of the construction. The only change being made now is, as I have said before, in substituting insulated cables for uninsulated ones which connect the negative bus bar at each substation to the structure itself. The bonds will unquestionably deteriorate. That is, they will not always make as good contact as they may perhaps when first installed, and it will be an extremely difficult matter for the railroad company to so keep track of every one of those bonds as to keep them in perfect condition.

Q. I presume it is an extremely difficult matter for the railroad company to keep track of each rivet in its road, and yet, with proper maintenance, it keeps the entire structure in good working condition, does it not?

A. It is a very different matter. The bond may be good to all appearances, it may be riveted up tight, and yet an oxidizing coating may have formed between the material of the bond itself and the material of the structure, forming a higher resistance, and, therefore, a bad conducting point, although mechanically it may be a good point.

Q. And you can always test the resistance of the various bonds, can you not by——

5886 A. You can make a test determine the resistance of the bonds and bond contracts, yes.

Q. And if it shows a higher resistance than a bond of that size ought to have, it would lead an electrical engineer to suppose something was faulty there, would it not?

A. Yes.

Q. And a remedy could be applied, could it not?

A. Yes.

By Mr. Burr:

Q. May not those conditions to which you have referred calculated to entirely destroy services—may they not have existed in the two blocks from which these exhibits were taken?

A. I don't know what you mean.

Q. Well, you referred a few moments ago and, I understood, agreed with the proposition that through galvanic action these services might be entirely destroyed?

A. Services might be destroyed through galvanic action.

Q. Now, I say might not those galvanic conditions calculated to entirely destroy services have existed in the two blocks from which these exhibits were taken?

A. They might have existed, but if they did those conditions would be all the more favorable to the destruction due to stray currents from the Manhattan Elevated Railroad, which were present by the evidence here shown.

Q. As a matter of fact, galvanic action produced by the junction of cast iron and wrought iron would destroy the wrought iron probably within the course of four months, and certainly within a very few years?

A. No, sir. The galvanic action set up by the combination of wrought iron and cast iron is of such a low electro-motive force that the electrolytic action which that would produce, would, in my opinion, be insignificant.

5887 Redirect examination by MATHEWSON:

Q. As to the elevated railroad, there is a bond on every girder, supposed to be, is there not?

A. As I understand it, yes.

Q. And that would make a very great number of bonds to look after, would it not?

A. An enormous number.

Q. Is it not a fact as to the elevated railroad the fact that the structure is what is known as a pin structure on some of the lines would conduce to the straying of currents and the loss of conductivity?

A. Yes.

Q. Now, as a matter of fact, is it not true that it is not in the resistance in any single conductor but the total from its point of leakage to conductors and back through the earth to final destination which governs the flow of current?

A. Yes, sir.

Q. Is it your view that the elevated even when the proposed changes are made will be a greater danger in the straying of currents than the subway as at present bonded?

A. Decidedly so.

Q. Is it not your experience that in sub-surface conduits or vaults generally there is present moisture?

A. Always.

Q. You would make no exception of the ducts in which these lead cables are, would you, from your general experience?

A. No, sir.

Q. You say that the maps show currents in other streets than the streets where the elevated is located, and you referred to Spring Street, where the sub-station is. The question which I asked on my direct examination is whether the currents shown as existing by the red line on the map of 1903, where those red lines appeared on other streets than where the elevated runs, as, for instance, up Broadway, might not also have come from the elevated currents?

5888 A. The red lines do not represent currents but positive potentials and they, in my opinion, are due entirely to the elevated railway.

Q. You said that in your investigation of the currents of the Edison Company you discovered a maximum of .4 of a volt. Is such a voltage as that dangerous or in-ocuous?

A. The .4 was the average of the maximum values, and I should say that such a value was entirely harmless.

Mr. Mathewson: That is all.

By Mr. Burr:

Q. I just want to call your attention—are you acquainted with Dr. Elliott of the Consolidated Gas Company?

A. No, sir.

Q. If Dr. Elliott of the Consolidated Gas Company in a proceeding against the city entitled, "In the matter of opening West Farms Road and Westchester Avenue to Southern Boulevard and Boston Road" last month stated that a small amount of salt in solution would corrode, would you agree with that proposition?

A. I could not say anything unless you give me further details.

Q. If he stated with regard to the mains and services that it would corrode them in a very short time, it may be a month or two, or it might possibly be a year, but certainly within a year they would have to have very serious repairs, would you agree with that statement?

A. I don't know.

Q. What did you mean by pin construction as referred to by Mr. Mathewson in bonding?

A. I mean instead of being riveted throughout, the 9th Avenue L is occasionally put together by pins, which do not make as good contact as a riveted structure would, the pin being for the purpose of enabling expansion to take place, just as, for instance, we have on some bridges.

Q. Don't they use solder?

A. Hardly.

5889 By Mr. Kirby:

Q. In your answer to Mr. Mathewson's hypothetical question having to do with the entire flow of current, you also intend that that depends upon the resistance which is interposed as well as the point from which——

A. That, of course, includes that.

Q. That should be included?

A. Surely.

Q. And you do not mean by that that the flow of current from any one point depends upon the difference of potential to some other point and the conductivity of the substance which is between?

A. No.

Q. You could not tell by looking at the outside of a rivet whether it was rusted inside, could you?

A. No.

Q. And no one else could?

A. No.

ALEXANDER MAXWELL, recalled for further examination, testified as follows:

By Mr. MATHEWSON:

Q. Referring to Exhibit 307, the question has been raised as to the method of determining the measurement of .95 amperes from main toward the house. This is the line from the main towards the house line and not towards the elevated, is it not?

A. Yes, sir.

Q. Did you determine that by running a wire from the main to the elevated pillar or in some other manner?

A. I made that measurement as indicated in this sketch (indicating).

Q. Just describe it if you can?

A. This measurement was made by taking the drop in milli-volts across or along a measured length of the service pipe and calculating the current from tables giving the resistance of that pipe.

5890 Q. So it was a measurement of current?

A. Yes, sir; that was the purpose of the measurement.

Q. And the measurement of current on the surface pipe would be certainly as heavy, would it not, as it would along the mains from which the service pipe came?

A. Yes, sir.

Q. The question has been asked about moisture in the ducts. When these lead pipes were drawn out did you happen to observe the manhole through which they were drawn, whether there was moisture within that or not?

A. Yes, sir, I was there when this cable was drawn out and the manhole had moisture in the bottom and the manhole was evidently moist.

Q. You did not see any manure in it, did you?

A. No, sir.

Q. The question has been raised as to the services which ran up from the main to the Manhattan Elevated stations. Are those risers insulated or uninsulated?

A. Those I have seen are insalated.

Q. Special insulating joints, are there not?

A. Yes, sir.

Q. And did you make any measurement of difference of potentiality as between the sections on each side of the joint?

A. Yes, sir, I read the difference of potential between the station side and the main side, that is the side connected to the gas main and found considerable difference of potential.

Q. How did you find that compared between the difference in potential in the elevated columns and the mains as you took it in the street close by?

A. They were in exact comparison practically.

By Mr. KIRBY:

Q. Have you your readings of the difference of potent-al across these joints in the risers?

A. I have them, yes, sir.

5891 Q. Can you tell us how great a difference there was?

A. Not for any particular case without referring to the original reading.

Q. Did you go all the way up to the risers or simply take the bottom joint?

A. I read across the insulator, from one side of the insulator to the other side.

Q. Where is that insulator placed with reference to the ground?

A. Two or three feet above the ground ordinarily.

Q. Did you not go farther up on the structure?

A. No, sir, not for that measurement.

Q. Did you not make any measurement on the risers then or at another joint on the other side of the insulator?

A. To include another joint?

Q. Yes.

A. No, sir.

Q. So you don't know whether or not there was any difference in potential between the joint immediately above the insulator and the joint immediately above that?

A. I don't believe I catch your question.

Mr. MATHEWSON: There is only one insulated joint.

Mr. KIRBY: I know that.

Q. You took a reading across that insulated joint?

A. Yes, sir.

Q. So we have the difference in potential in the riser underneath, that is, the under side of the insulator and on the further side of the insulator?

A. Yes, sir.

Q. Now, we will go up fifteen feet on the riser, and we will assume that we desired to take a reading at that point, between that point and, say, ten feet above that. Did you take any such readings?

A. No, sir.

Q. Did you make or have any analysis made of the substance which — in the duct out of which Exhibit 324 was drawn? 5892

A. What substance?

Q. The moisture that was there?

A. No, sir.

Q. Or dust or whatever it might be. It was moisture, wasn't it?

A. All ordinary water what I saw.

Q. You did not analyze it, did you?

A. No.

Q. Did you test it with litmus papers to see whether it had any acid reaction or not?

A. No, I could not say.

Q. Where is the pipe which accompanies this Exhibit 307, what pipe is that?

A. Can you tell me what the exhibit number is which corresponds to Exhibit 307?

Mr. Mathewson: 306.

(Pipe produced.)

Q. Referring to Exhibit 306, I understand you that this is the pipe set down on Exhibit 307 as the one upon which you took readings of the voltage at different points?

A. Yes, sir.

Q. Now, did you remember where on this pipe you took, say, your first reading?

A. No, I could not say.

Q. How far distant were those points?

A. Probably as far apart as I could get them.

Q. Probably six feet apart, the length of this pipe, say?

A. As nearly six feet as I could get it, I don't remember.

Q. And those readings gave you a difference in voltage of 1.4 volts?

A. Oh, no, that is another measurement altogether. That is the difference in potential.

Q. Then this statement down here of .95 amperes is simply the deduction which you made from the readings which you took, applying it to certain tables which you had, to give the resistance of a pipe of this diameter?

A. Yes, sir.

5893 Q. Did you make any allowance for the increased or decreased resistance which the pipe might have by reason of the condition it is in?

A. No, sir.

Q. What tables did you use?

A. Some tables that I obtained indirectly and which I believe were originally computed by Mr. Knudson.

Q. For what kind of material was that table prepared?

A. Wrought iron pipe.

Q. Did it give different diameters of pipe?

A. Yes, sir.

Q. Different thicknesses of pipe?

A. Standard thicknesses; that is, it was for standard pipe.

Q. Do you know whether or not this pipe is standard pipe?

A. No, sir.

Q. And then this result of .95 of an ampere is simply without correction of any kind for those matters I speak of?

A. Without those refinements, yes, sir.

By Mr. Burr:

Q. Do you recall at what side that pipe, Exhibit 324—how it lay in the conduit, which was the bottom of it?

A. This would be the bottom (indicating).

Q. The side on which the corrosion is was the side which lay on the bottom of the conduit?

A. Yes, sir.

Q. Do you wish to be understood as saying positively that there was no dust or other street refuse in that conduit?

A. I did not see any.

Q. Well, you did not look for any, did you, just pulled the lead pipe out?

A. Yes, sir. Of course I could not see the length of the conduit.

5894 COLIN C. SIMPSON, recalled for further examination, testified as follows:

By Mr. MATHEWSON:

Q. What kind of pipe does the Consolidated Gas Company use in its services, standard pipe or otherwise?

A. Standard pipe only.

Q. Do you know of any instance where it has used anything but Standard pipe?

A. On service pipes, no, sir.

Q. Is there anything to indicate that that pipe before you to which Mr. Maxwell has just testified is not standard pipe?

A. No, sir, nothing at all.

By Mr. KIRBY:

Q. What do you mean by standard pipe?

A. What is sold in the market as standard weight pipe.

Q. What weight is that?

A. I could not tell you offhand from my head.

Q. Do you know what weight that pipe is, Exhibit 306?

A. I do not. I know if it is a Consolidated Gas Company's service, it is nothing but standard pipe.

Q. Do you know when that pipe was put in?

A. I do not.

Q. Do you know when it was taken out?

A. I do not.

Q. You did not know that these experiments were being made?

A. Which experiments?

Q. The electrolytic experiments?

A. Which ones are you talking about?

Q. All we have been hearing about the last two or three days?

A. I have not heard all of them.

Q. Did you know that any experiments were being made for the purpose——

A. I did—for the purpose of what? You did not finish your question.

5895 Q. For the purpose of being put in evidence in this case?

Mr. MATHEWSON: They were not made for the purpose of being put in evidence in this case.

The WITNESS: No, not for the purpose of being put in evidence in this case.

Mr. Mathewson: No notion of them until you put in your case and we had to rebut it.

Q. Then these pipes were removed without any knowledge on your part?

A. It depends where the pipes were removed from. If you will tell me where they came from, I will tell you whether I had any knowledge of it.

Q. This pipe was removed from 456 West Broadway.

A. If 456 West Broadway is at Spring Street and West Broadway they were removed with my knowledge.

By Mr. Burr:

Q. Mr. Simpson, you recall that when you were here a day or so ago on the stand, I called your attention to the question of services, you stating that the company could not put a main in the middle of the street because it would lengthen the service, and I asked you then whether you remembered stating that the services were, after being placed in the buildings, of no further utility to the company, that is, they became property that if the gas were discontinued you abandoned the property, the services themselves.

Mr. Mathewson: No, he did not testify to any such thing——

5896 Q. One moment. I asked you if in a tax proceeding you did not testify so, and you said no, it must be somebody else——

Mr. Mathewson: I object to this.

Q. The case I had reference to is in the Supreme Court, entitled the People *ex rel* the Consolidated Gas Company against James L. Wells, and others, in Special Term, Part IV, November 17, 1905, where you appeared as a witness, do you recall that?

A. Yes, sir.

Q. And did you testify in that proceeding: "That it would cost ten times as much to take out services as we could get for the material. Q. In other words, it would not be worth taking up and carrying home? A. Not by any means. Q. Is that the reason why you stated you did not take out the three thousand services you referred to as being discontinued in a certain period as was mentioned by counsel for the respondent? A. Yes, sir. We never take out—we have probably sixty thousand of them to-day which are discontinued and they are not worth taking out." Was that your testimony on that occasion?

A. I would like to qualify my answer——

Q. Was that your testimony on that occasion?

A. I testified that where services were cut off from the mains and were no longer fit for use we never took them up; I never testified that a good service was abandoned.

Q. I am not referring to that, but to services that were discontinued.

A. We repeatedly, with two or three services in the building, we replaced one of them, and the other two or three which are no more fit to use would have to be replaced at large expense, and we cut them off at the main and abandon them.

Q. Did you so testify, and if you did, is it correct?

5897 A. I would have to look over my testimony and be very careful about it before I answered that question.

Q. Look at your testimony (handing book).

A. I may say in the first place that we could not or did not lay mains in the middle of the street because it took longer services. I testified that we did not because the city would not give us a permit, and on your question whether it would pay us, I said it would not, because we would have a longer service from each side of the street.

Q. Then I called your attention to this testimony and you testified you never made such statements as I quoted, but that it must have been somebody else.

Mr. Mathewson: He did not. He made no such statement.

The Master: It is hardly cross-examination of any direct examination brought out here to-day, but now that Mr. Burr has caught him—when I say caught, I mean caught him here in the room—he may proceed.

Mr. Mathewson: How is it possibly pertinent? What difference does it make whether we abandon services which are useless or not? Of course we do, and they are marked off the property, too.

Mr. Burr: That is what you say when you want to avoid taxes, but when you want to capitalize they all appear.

Mr. Mathewson: How does it help your case?

Mr. Kirby: That is a matter of argument.

Mr. Mathewson: It is a waste of time.

Q. Well, I will not consume any more time now. Any time I would be glad to let you see the original papers.

5898 A. Very well, but I want to look at this testimony. I have been on the stand a good many times in the last three or four years and I would not say what I testified to at any particular time. I know we have thousands and thousands of services cut off from the mains that are no longer of use, and the value of the material taken up might be fifteen cents and the cost of taking them up would be more than $15, and we would not be stupid enough to take that material up, no question about that. But a good service that is still connected with the main and still going into the house and ready to supply gas at any time is always left and is kept on our book as a service. If it is cut off at the main and abandoned it is taken off our books.

Q. Did you not claim in that proceeding that the services became the property of the owner?

Mr. Mathewson: That is the inside service in the building. It is a legal question whether it is or not.

The Witness: If it is abandoned and he wants to take it he is welcome to it. We do not want it if it is an abandoned service.

By Mr. Mathewson:

Q. Where a service is abandoned, as you have indicated, it is taken off the books as an asset, is it not?

A. Yes, sir.

By Mr. **Kirby**:

Q. You mean that you report to the other department of the company that it has been abandoned?

A. Not only that, but I take it off my schedule of services at the same time, and it is reported down stairs, too.

5899 **Oscar H. Fogg**, called as a witness in behalf of the complainant in rebuttal, being duly sworn testified as follows:

Direct examination by Mr. **Mathewson**:

Q. Mr. Fogg, when Mr. Simpson was on the stand some days ago certain sketches were introduced in evidence showing the condition of the streets at various points, certain drawings or maps showing the mains of the company, subways and other structures. Were they prepared by you or under your direction at Mr. Simpson's request?

A. They were.

Q. And so far as the location of the mains is concerned, of course, the company has a record of that itself?

A. Yes.

Q. So far as the subway is concerned, was that drawn in from the maps of the subway company or their tracings?

A. Which subway do you refer to?

Q. I mean any of the subways where they occur?

A. The Rapid Transit Subway or others?

Q. Either one.

A. From the record of the company in every case.

Q. Did these measurements come out so as to take up the width of the street and fall into systematic order as you have them?

A. Yes.

Q. And are there manholes and hydrants and valves at one point and another by which you can test the accuracy of your map by the measurement of the manholes?

A. To a very great extent.

Q. And did you check up the sketches with the known dimensions and locations of manholes, valves and hydrants where they appeared?

A. Yes, in this way, with the various sections that are shown on city records, were taken from the city record by our men and verified by the street locations wherever that was possible.

5900 Q. Exactly. And the completed work, as so testified, the sketches which are introduced in evidence are the drawings?

A. Yes, sir.

Q. Did you take certain photographs, or were photographs taken under your direction of the work actually in progress, showing the laying of the mains and the difficulties?

A. Yes, sir.

Q. The first one you show me is Manhattan Street east of Amsterdam Avenue, is that the trench for the laying of a main?

A. Yes.

Q. Gas main or water main?

A. Of a gas main.

Q. All these photographs were taken either by you or in your presence?

A. Yes, I think they were all taken by me.

By Mr. **Mathewson**:

I offer that in evidence.

Photograph received in evidence and marked Complainant's Exhibit 326.

Q. Was this other taken at 112th Street west of Second Avenue?

A. Yes.

Q. What sort of a main is that being laid?

A. Gas main.

Q. What size, do you remember?

A. 36 inches in diameter.

Mr. **Mathewson**: I offer that photograph in evidence.

Photograph received in evidence and marked Complainant's Exhibit 327.

Q. And this is one at 112th Street across Lenox Avenue?

A. Yes, sir.

Q. What does that represent?

A. That is a special flat steel box, which was necessitated by the shallowness of the Rapid Transit tunnel.

Q. In laying your main?

A. In laying our main, to replace the cast iron pipe ordinarily used.

5901 Mr. **Mathewson**: I offer that photograph in evidence.

Photograph received in evidence and marked Complainant's Exhibit 328.

Q. This place which I show you now represents the intersection of 116th Street and St. Nicholas Avenue and Seventh Avenue?

A. It does.

Q. Are those chains supporting pipes of one kind or another, while the mains are being laid?

A. Yes, sir.

Mr. **Mathewson**: I offer that photograph in evidence.

Photograph received in evidence and marked Complainant's Exhibit 329.

Q. And is this photograph which I now show you a photograph of St. Nicholas Avenue and 116th Street, looking north?

A. It is.

Q. And that also shows the work in progress supporting the different pipes?

A. It does.

Mr. **Mathewson**: I offer that photograph in evidence.

Photograph received in evidence and marked Complainant's Exhibit 330.

Q. Is this pipe laying at 111th Street east of Third Avenue, which I now show you?

A. Yes, sir.

Q. What size main is that?

A. 36-inch.

Mr. Mathewson: I offer that photograph in evidence.

Photograph received in evidence and marked Complainant's Exhibit 331.

Q. Where is this work proceeding in the cut I now show you?

A. That is at the northeast corner of Broadway and Manhattan Street.

Mr. Mathewson: I offer that photograph in evidence.

5902 Photograph received in evidence and marked Complainant's Exhibit 332.

Q. And this photograph that I now show you represents Broadway south of 131st Street, east side, does it not?

A. Yes, sir.

Q. What are the logs in the trench?

A. They are put on the rock after it has been prepared for blasting.

Q. The ordinances require you to cover the rock before blasting?

A. Yes, sir.

Mr. Mathewson: I offer that photograph in evidence.

Photograph received in evidence and marked Complainant's Exhibit 333.

Q. Where is this work going on in the one I now hand you?

A. That is on the east side of Broadway and Manhattan Street.

Q. Do you know what size main is being laid there?

A. 36-inch gas main.

Q. And the sheathing braces appear there?

A. Yes, they do.

Mr. Mathewson: I offer the photograph in evidence.

Photograph received in evidence and marked Complainant's Exhibit No. 334.

The Master: Are there any there where the blocks appear?

Mr. Mathewson: Do you mean underneath?

The Master: Yes.

Mr. Mathewson: I doubt if there are. These are taken from above. I do not think any of them show the bottom of the pipe as laid.

Mr. Mathewson: That is all.

Mr. Kirby: Before taking up the cross-examination of Mr. Fogg I should like to have it stated on the record that the defendants move to strike out all of the testimony that has been put on record in reference to electrolysis, on the ground that the same is not proper rebuttal. 5903

Mr. Burr: I understand it was taken subject to the same objection we made to the other witnesses on electrolysis, that it was not proper rebuttal.

Mr. KIRBY: And I now not only object to it but move to strike it from the record.

Mr. BURR: And I make the same motion.

The MASTER: Motion denied.

Mr. BURR: Exception.

Mr. KIRBY: Exception.

Cross-examination by Mr. KIRBY:

Q. Are you in the employ of the Consolidated Gas Company?

A. Yes, sir.

Q. In what department?

A. The Department of Mains and Services.

Q. Have you ever laid mains?

A. Yes, sir.

Q. Are you familiar with the method of work of laying mains?

A. I am.

Q. What position do you occupy in reference to that part of the work?

A. I am an engineer employed by the company.

Q. Do you have charge of the men putting the mains in the ground?

A. At times, supervision of the work.

Q. Now, taking up these photographs, referring you to Complainant's Exhibit 326, showing an excavation at Manhattan Street, east of Amsterdam Avenue, will you kindly state if you know the size of the main that is now in that trench?

A. 36-inch.

Q. Was that trench excavated for the purpose of putting down another main or for putting that main in?

A. That main only.

5904 Q. How is that main supported, does it lie upon the bottom of the trench?

A. It lies upon blocks.

Q. Can you see those blocks in this photograph?

A. I don't know, I doubt very much. That would be under the main, and I do not think you could.

Q. Is that the figure of a man that I see there?

A. Yes, sir.

Q. That man seems to have his hand at about the center of the pipe, does he not?

A. It appears so, yes, sir.

Q. He is standing up, is he not?

A. Yes, he is standing up.

Q. It would, therefore, appear that there is considerable excavating underneath the main, would there not?

A. No, I do not think so.

Q. You said the size of the main was how much?

A. 36-inch.

Q. Well, the man is more than 36 inches high, is he not?

A. His head is considerably higher than that.

Mr. Mathewson: You cannot figure on perspective when you are photographing down in that manner.

Q. Is it your testimony that the man is standing on a level with the bottom of that pipe?

A. That I cannot say.

Q. So that it might be that that excavation is lower than the bottom of the pipe?

A. It is possible; I don't say so.

Q. But from this photograph and from your impression, you could not inform us just how that pipe was laid in that trench?

A. I cannot because the photograph is rather indistinct there. It is a very hard place to take one clearly. It does not look clear to me from here.

Q. You see another pipe running more or less diagonally across the trench?

A. Yes, sir.

5905 Q. Held temporarily in place, I suppose, by chains thrown over a beam laid across the trench?

A. Yes, sir.

Q. Do you know what that pipe is, what purpose it serves?

A. Yes, that is a 16-inch water main.

Q. And was there prior to the putting down of the 36-inch gas main?

A. It was.

Q. That does not run the entire length of the trench, does it?

A. No, about the point I indicate here on the photograph it enters the ground again.

Q. That is the point where the chain supports it?

A. No, a little beyond where the chain supports it.

Q. It leaves the trench?

A. At a point beyond the chain, yes sir.

Q. So this position is one where the digging and laying is complicated by the water main crossing the trench?

A. Well, not to any great extent, no; that did not enter into any very great consideration at that point.

Q. Then the interference with the digging by that main would amount to practically nothing?

A. That would not have forced *as* down to that depth. There were considerable other substructures beyond that which do not appear in the photograph that forced us to make that trench in that way.

Q. But this did not cause any great care to be taken on your part?

A. Only the necessity of taking care of it and protecting it, because it was exposed in the trench.

Q. Turning to Complainant's Exhibit 327, showing an excavation at 112th Street west of Second Avenue, I ask if you know the size of this main shown on this trench?

A. That is a 36-inch gas main.

Q. And that has just been placed in the trench?

A. Yes, a comparatively short time, and it is all *for* in the process of construction.

Q. Not for repair or anything of that kind?

A. No.

5906 Q. I see no pipes or anything laid within the trench?

A. No.

Q. Do you know the width of these joists, which are thrown across from one side of the trench to the other?

A. Do you mean the width of the joists, between the sheathing or rangers?

Q. You see here the sheathing on one side, and here the sheathing on the other side. Going across from one side to the other I notice a piece of wood, which I call a joist; I don't know what you may call it; is that a proper designation?

A. A brace or joist.

Q. Now, that brace, we will give the length of that brace the distance from one side of the trench to the other, and we will call the height the vertical dimension of it; can you tell me the height of that brace?

A. I think it is about twelve inches high, as you express it, there; that would be the width ordinarily.

Q. My first designation, therefore, is more correct than the one I have been led into?

A. Yes.

Q. That is resting upon the top of the pipe, is it not?

A. No, within a short distance of it, not right on top of th- pipe.

Q. This photograph is too indistinct on the side to show the nature of the bottom of that trench, is it not?

A. Well, the light is so that it would not show it, is rather a clear photograph, but it does not show that owing to the darkness on the side of the pipe.

Q. You would have had to take that by flashlight to bring that out?

A. Yes, I suppose so.

Q. I notice on this joist running across the trench that there is a cable or rope of some kind. Is that for the purpose of supporting the pipe?

A. That is the rubber band, pouring band which has been laid over the pipe after they hav- poured the joint.

Q. I do not mean that, that is nearer the foreground of the
5907 photograph than I referred to. That is the crosspiece.

A. No. They are the iron clips or clamps which hold the rubber band together at the top.

Q. Can you give me the approximate distance from the point here at the top of this brace to which I made reference to the top surface of the ground here?

A. No, I cannot. That is very much foreshortened in the picture, and I would not be able to do more than guess at it.

Q. Would you think it was more than twice the distance of the cross-piece, twice the height of the cross-piece, or the width?

A. I do not believe so.

Q. The width being the term which we have agreed upon as more correct than the height?

A. Yes.

Q. This triangular arrangement which I notice over the trench is, I suppose, the bottom of the derrick with which the pipe is lowered into the trench?

A. Yes.

Q. Now, coming to Exhibit 328, showing an excavation at 112th Street across Lenox Avenue, this oblong box which I see is really an oblong wrought iron pipe, is it not?

A. It is a riveted steel box.

Q. For the purpose of carrying the gas over the subway structure?

A. That is right.

Q. And that in turn will be connected with the gas main?

A. Yes, sir.

Q. By a joint bringing it down to the particular dimensions of the main?

A. That is right.

Q. Do you know the width of that box?

A. Three feet four and a half inches inside.

Q. That would mean the over-all dimension would be several inches more?

A. You are referring to the width, from this part to this part (indicating)?

Q. Yes, across the trench?

A. Three feet four and a half inches inside.

Q. Is that inside or outside dimension?

A. Inside as I remember it.

5908 Q. Do you remember the width of the flange on either side?

A. Not exactly, I think it was about four inches.

Q. So that would be eight inches added to the inside dimension to get the full width of the box?

A. Yes.

Q. Here we observe the bottom of the trench, do we not? The sun seems to be reflected upon the bottom of this trench?

A. It is at a point beyond the subway wall.

Q. Now, I fail to notice any blocking upon the bottom. Can you point out any to me?

A. No, sir, there is none there.

Q. I fail to notice any sheat-ing on either side of the trench. Can you point out any to me?

A. There is not any there. There would not have to be any there. The subway roof was altered and a special construction was necessary to take the pipe and the flat pipe was laid directly on the subway roof and a special concrete base put in and steel I-beams set in the concrete base.

Q. Yes, but the bottom of the trench which we see beyond that is not sheat-ed?

A. No, that is not ready for the pipe.

Q. But the excavation has been partially made, hasn't it?

A. Partially made, it is not down to grade there, I don't think.

Q. You don't know whether or not it is down to grade?

A. Yes, I am quite certain it is not.

Q. Is there more excavation to be done?

A. Yes.

Q. Do you know how much?

A. No, not definitely.

Q. It is pretty nearly down to grade, is it not?

A. No, there is enough more to come out to permit the laying of a 36-inch pipe to pass under the hub of the water pipe which you see exposed. It had to be cut out.

5909 Q. This water pipe had to be removed?

A. Yes.

Q. You are sure that is a water pipe? Is not that a gas pipe?

A. No, that is a water pipe. It is a water pipe which goes into a dead end, just south and we had to cut it out at that point.

Q. Coming to Exhibit 329 showing an excavation at the intersection of 116th Street and St. Nicholas and Seventh Avenues, are these pipes I see supported by chains those which have been put in, or where is the pipe which has been put in?

A. The man in the picture is standing on the pipe which has just been put in or lowered into the trench.

Q. Do you know how deep the trench is at that point?

A. To the bottom of the trench is about eleven feet deep, measured from the street surface, or pavement surface.

Q. And does the trench continue here? What is this I see over the man's head?

A. That is the construction under the railway, where it was necessary to tunnel. We were not allowed to open and it had to be tunneled out and the railroad was over it.

Q. So there is a deep hole some eleven feet to the bottom or the top of the pipe?

A. To the bottom.

Q. Up to this point where the ragged edges indicate the tunnel?

A. That point is just at the south rail of the street railway company.

Q. Is this through dirt or rock, do you know?

A. Through very hard dirt.

Q. Is there any sheat-ing here?

A. There is none necessary at that point because of the very great hardness of the dirt; it was unusually hard.

Q. Coming to Complainant's Exhibit 330, showing an excavation at 116th Street, St. Nicholas Avenue and Seventh Avenue looking north——

A. That is practically the same point as the photograph you have just been looking at *it*.

Q. The largest pipe indicated here and the one lowest
5910 down in the trench is the pipe you have just put in?

A. Yes.

Q. Again there is no sheathing indicated?

A. No, only the bracing of the dirt that has been loosened up above by the derrick legs.

Q. No necessity to use sheathing?

A. Not at that point. Just that one point from the south side of the street railroad tracks to the north side for a short distance it is very hard.

Q. Does this indicate any blocking?

A. The blocking is there, it does not show in this picture, maybe. Every foot of the main was blocked, or every six feet; I think I can safely say that I saw every length of pipe blocked.

Q. Are these two pipes shown here above the larger pipes gas mains or water mains?

A. I know that one is a gas main and I think that both of them are. One of them I am sure of. This one here (indicating).

Q. The next is Complainant's Exhibit 331, showing an excavation on 111th Street east of First Avenue. Is this a daylight photograph?

A. Yes, that is rather a poor photograph; strong sunlight and overexposed, I guess.

Q. I cannot make anything out of that.

A. This is the main here, and this is a pump. We were down to tidewater there.

Q. How far down were you in this excavation?

A. In its deepest parts we were down about twelve feet to the bottom of the pipe. At the part you are indicating with your finger, which is just where the main starts to go down, we had a cover of only three feet and some inches.

Q. What was the object of dropping the pipe at this point?

A. It was necessary to go under a sewer, some gas mains, a water main, subways and possibly some others; that is all I remember now.

5911 Q. And the size of this main was what?

A. 36 inches.

Q. None of the drawings which have been put in evidence and which were prepared under your supervision give a cross section of the avenue at this point, do they?

A. No, we did not go uptown that far with them. I don't think anything has been put in evidence above 42nd Street, and this was at 111th Street.

Q. Coming to Exhibit 332, showing excavation at the corner of Manhattan Street and Broadway, is there some tunneling being done here also?

A. No tunneling, no, sir. We are under a very large structure there. A subway manhole was here (indicating), and the subway entering on both sides, north and south, which rather gives the appearance of being tunneled, but it is actually a concrete structure. We turned right at that point, and did not follow right directly under the subway.

Q. And that meant tunnel work?

A. No, possibly only right under the crosswalk.

Q. Well, looking in the upper left hand corner of the photograph I notice several outlines of large stones or rocks, or what not. Did your trench continue in that direction?

A. No, sir.

Q. Your trench turned off to the right?

A. Followed the line of the subway shown here in this section (indicating).

Q. By here you indicate a block supported by a wire cable around a joist above?

A. That is a subway, the electrical subway; that is the concrete covering, protective covering, around the ducts which you see there.

Q. That is the Edison Company?

A. I don't know whether it is the Edison Company; it is one of the electrical companies.

Q. Either that or the Consolidated Telegraph, etc., Company?

A. I suppose so; it is one of those companies.

5912 Mr. Mathewson: Or the telephone company?

The Witness: I don't know just which one. A manhole is right there.

Q. And you followed under that subway?

A. Right at that point in crossing it, yes; crossing it and following the same general direction.

Q. And went underneath because there was not room enough between the top of this and the surface?

A. No, right above the point in the picture is a large subway manhole which we could not get past without going under it. The subway itself did not drive us down, but the manhole did.

By Mr. Mathewson:

Q. Do you mean the railroad subway, or subway for the surface railroads?

A. I mean the subway, properly speaking, the electrical conduits which were inclosed in this case with concrete.

Q. For the street railroads?

Mr. Kirby: No, he means the subways carrying conductors, either for the Edison system or the telephone system, or the telegraph system, some one of the constructions carrying the electric conductors in the street.

The Witness: Yes.

Mr. Kirby: And I asked him if he knew which subway it was and you heard his answer.

By Mr. Kirby:

Q. This main drops down at this point, does it not?

A. No, sir, that is deep there already, it does not drop at the point where you can see it.

Q. How deep is that?

A. I know about what it was.

5913 Q. Is it ten feet?

A. No, it is nine feet.

Q. Here we have Exhibit 333, showing an excavation at the corner of Broadway, south of 131st Street, east side. There is no pipe in that trench at all, is there?

A. No, that is between street intersections.

Q. You mean by that this is running along——

A. It is running north at a point north of 10th Street, or it is between the north curb of 130th Street and the south curb of 131st Street.

Q. Is there any traffic along this avenue?

A. Yes, some.

Q. I notice rock piled up on the left hand side of the trench as we look at the photograph. That was taken from the excavation?

A. It was.

Q. Is this rock on the right hand side, or is that soil?

A. Soil, and may be smaller rock, which is not big enough to hand out in pieces, and it is thrown out by shovels.

Q. Is it your custom to throw your rock on one side and your soil on the other?

A. It is necessary to cart the rock away. For that reason, in that case, it was put on one side of the trench, where it could be reached from the roadway; there is no roadway on the right side of the trench in that picture.

Q. Do you mean there is a sidewalk there?

A. There is a sidewalk, no roadway for wagons.

Q. What do you mean by roadway for wagons?

A. I mean that the wagons could not go on the sidewalk.

Q. Why could they not go on the street?

A. They could.

Q. Then there is a roadway?

A. I say there is no roadway on the right side of the trench, so that the rock has been piled on the left side of the trench so the wagons could reach it and move it. The trench is at a comparatively short distance from the curb on the right side. 5914

Q. And they could not load from each end, do you think?

A. From each end?

Q. Yes.

A. I mean that the wagons could not get in on this side (indicating). We have already thrown our earth here, and we are in rather close to the curb, and we cannot approach the trench from that side.

Q. Do you know how far it is from the immediate foreground of this photograph, to where I think I see a fence across it at the end of the open part?

A. No, not definitely. It is apparently about half the length of the block, I should say about one hundred feet.

Q. Has any pipe been put in this trench at this time?

A. No, the trench has not been gotten ready for it at this stage.

Q. Do you know where it commences?

A. In the street. No, this is Broadway, south of 131st Street.

Q. Where does that start, do you know?

A. That is a continuation of the trench that has been shown from time to time in the photographs. Do you mean right at this particular point?

Q. Yes, how far to this point have you laid your pipe?

A. I think at the time I took that photograph we were within a very short distance of it; in fact, we were held up—I remember quite clearly now the fact that we were within a short distance of this and the nature of the rock there and the trouble we had with it compelled us to stop the pipe work. I think the end is within comparatively short distance of it.

Q. A block?

A. Less than that.

Q. This dirt I see here will be thrown back in the trench?

A. The clean dirt in which there is no stone.

5915 Q. And the rock over here is going to be removed?

A. Will have to be.

Q. If there had been no rock, you would simply have tossed it all up on this side?

A. Yes.

Q. What is the character of the pavement here, do you know?

A. At that time it was macadam on a Telford base.

Q. Was it to be replaced by other pavement?

A. Yes. I don't know just how soon after we completed the work; it has been since replaced with an improved pavement.

Q. When was this photograph taken?

A. 1904, September, the latter part, or it may have been the first part of October. It was within a month either way.

Q. Most of these photographs were taken at the same time?

A. No, they were taken from the start right through the work. We started in April, and it was finished in October, all of the same year, though.

Q. Now, we come to the last one of these, Exhibit 334, showing an excavation at Broadway, north of Manhattan street, east side. Is it the same gas main?

A. The same main.

Q. And a continuation of the same trench?

A. It is.

Q. And is this macadam road here?

A. Yes, that is macadam.

Q. This main is being laid right up to the curb, is it not?

A. Yes, we were forced right up to the curb there by the other structures in the street, a big water main, the foundation of the Rapid Transit viaduct or the piers, which were very extensive, and spread out, and it was the only possible location there, and even then we had to go very deep.

Q. What is that, running along the right hand side of the trench?

5916 A. That is the same subway which was shown in another picture, that we had to carry in the trench and support.

Q. And naturally your trench had to be wide enough to permit the pipe to pass between one side of that subway and the other side of the trench?

A. Yes, that is right.

Q. Do you know the width of that trench?

A. No, I don't remember the exact width of the trench.

Q. Do you know the depth of the trench at this point?

A. At that point it had the same depth as the other picture we looked at a little while ago, just around the corner the pipe is about nine feet cover.

Mr. Mathewson: Nine feet to the top of the pipe, do you mean?

The Witness: Nine feet to the top of the pipe.

Q. Are there any obstructions other than this subway or the manhole to the same that you encountered along that length of trench?

A. Yes, sir, a 36-inch water main just—it does not show there. It is at a point just north of the derrick.

Q. And you went under the water main?

A. And we went under the water main.

Q. There was not space enough to go over it?

A. No, sir.

By Mr. Burr:

Q. When did you say these photographs were taken, in 1904?

A. They were taken between the 22nd of April and the 28th of October, 1904.

Q. Was the object in taking these photographs at that time to show some especially difficult work?

A. Oh, no.

Q. What was it?

A. Merely as a matter of interest as the work went along and as a matter of record.

5917 Q. You do not mean to say you photographed the whole work, do you?

A. Well, so far as I found time and wherever it was convenient, yes. I took photographs along the line at intervals from time to time as I say for a matter of record.

Q. In addition to being engineer of the mains are you the official photographer of the company?

A. Not yet.

Q. You hope to?

A. I hope so.

Q. I notice in this Exhibit, Complainant's Exhibit 333, that there has been blasting there evidently, as the result of which there is a great deal of rock piled on the side?

A. Yes, that is true.

Q. What do you do with the rock after you take it out as it appears there?

A. It is loaded into wagons and driven away and dumped.

Q. Sold by the company, do you know, or do you know anything about it?

A. I have never heard of its having been. It was not on that work. I never knew of it having been sold.

Q. Did you dump it some place or give it away?

A. It is dumped at the same dumps where the earth is carted to, the excess earth when it is necessary to cart excess earth from a trench.

Q. Where is that point?

A. Various city dumps. I don't know their exact location.

Q. This Exhibit 334, is that immediately below the viaduct structure?

A. It is directly to the east of the viaduct structure, yes, sir.

Q. On Broadway?

A. On Broadway.

Q. What do you say was the particular use of this steel box as it appears on Exhibit 328?

A. It was to convey the gas, a special construction necessitated by the shallowness of the roof of the Rapid Transit subway in Lenox Avenue where we didn't have space enough to get the ordinary cast iron main across at that point.

Q. In other words you were able to convey the gas by that 5918 method at a comparatively shallow depth?

A. No. By that method we got more cover than would have been possible in any other way, getting the same capacity, that is the same capacity for the conveyance of the gas.

Q. Well, because of the fact of that iron structure you were able to convey gas at comparatively shallow depth in comparison with the large, round main that you speak of?

A. No, that is not the case. This was the only possible way of making that crossing at that point. It would not have been possible to put a cast iron pipe 36 inches internal diameter across there at all. The best possible thing to do was to put some special construction there that would give the same capacity for the conveyance of the gas and would permit of more cover. The construction or the height of the Rapid Transit roof at that point made it utterly impossible to give the proper cover on even this box.

Q. How much covering did you have?

A. We had about 16 inches. That was too little, but as much as possibly could be gotten.

Q. What was the depth of the trench at that point?

A. That is where the trench has been excavated for the connecting ends to go down to their normal depth. We went to the proper cover as soon as we could get away from the subway.

Q. I mean the immediate part of the trench in which that box was sunken?

A. There is no trench at that point. We have laid the roof apart, cut out the concrete construction of the roof, set in three-inch I-beams and constructed a special roof for the subway, but properly speaking there is no trench at that point.

Q. How long have you been engaged in looking after the mains of the Consolidated?

A. I have been employed by the Consolidated Gas Company since the early part of 1904.

5919 Q. Do you weigh the mains before you put them in the ground?

A. No, sir. We record their weight which is already marked on the pipe.

Q. When, before they are taken to the place at which they are to be sunk?

A. Yes.

Redirect examination by Mr. MATHEWSON:

Q. Referring to Exhibit 336, as a matter of fact, you went down in different parts of this trench or in laying this main as deep as fifteen or twenty feet, didn't you?

A. In two places that I remember we reached a depth of between eighteen and nineteen feet to the bottom of the trench.

Q. Didn't you have to go under four 40-inch water mains and a lot of sewers?

A. We had to go under seven 48-inch water mains in one place and a valve chamber besides in one intersection.

Q. Is it part of your duty to supervise the laying of pipes when a pipe is blocked?

A. Yes, sir, it is.

Q. You say each length has two blocks, one back of the hub and the other about the middle?

A. Two blocks to every length and a block to every special; a piece of cut pipe receives the same blocking as a full length would provided it is over six feet.

Q. Now, in reference to Complainant's Exhibit 330, it appears that the pipe is running in several different directions there?

A. Yes, sir.

Q. As a matter of fact, that is the junction of St. Nicholas Avenue, 116th Street and Seventh Avenue?

A. Yes, sir; three streets.

Q. And does that account for the direction of the pipes?

A. This is north, running north on St. Nicholas, that is on Seventh, and that following St. Nicholas in a general line (indicating directions of pipes on photographs).

Q. Do you remember how many sewers you went under in that whole job?

A. I could remember it more quickly by taking it by intersections we went under the first sewer at——

5920 Q. Tell somewhere near, you need not recite them?

A. Five.

Q. As a matter of fact, is it not true that this job uptown was in a wider street than most of the streets downtown?

A. Yes, sir.

Q. And that the congestion of structures under the surface was correspondingly less than downtown?

A. Yes.

Q. And if you were laying a pipe up Broadway in the lower part of the city, instead of up Broadway in the upper part of the city, the obstructions would be comparatively greater than as shown in the photograph?

Objected to as incompetent, immaterial and irrelevant.
Question allowed. Exception.

A. Very much greater down town.

By Mr. Burr:

Q. What do you mean by the "valve chamber" to which you made reference?

A. The valve chamber I spoke of was a brick chamber enclosing four blow-off valves and the blow-off connections from a sixty, two thirty-six and one forty-eight inch water main where they blow-off into the sewer to carry away the sediment from the bottom of the main. They house their valves in a brick chamber at some particular point—I suppose they do it generally, I don't know.

Q. Do you know of any place in the lower part of New York where you have to dig lower than twenty feet?

A. Lower than twenty feet?

Q. Yes.

A. I have seen intersections or parts of intersections exposed throughout the lower part of New York where I don't see how it would be possible to get in a pipe any shallower than that, and I have seen one pipe in the course of construction where I know the depth was that great.

5921 Q. That is the depth to which I understand you claim you were compelled to go at these points shown by these photographs, or some of them?

A. That is the depth, yes. In some cases it is greater than I notice.

By Mr. Kirby:

Q. How many feet of pipe have you laid in the lower section of the city?

A. Laid none.

Q. You had charge of the laying of this pipe in the upper sections?

A. I did.

Q. You had charge of the laying of pipe in——

A. In New York, yes; supervision of it.

Q. Have you ever had charge or supervision of laying pipe in the lower section?

A. No, not particularly laying. I have had supervision of alteration work on account of the Rapid Transit subway in the lower part of the city, seen the mains laid, followed them up and inspected them.

Q. If you were obstructed by a manhole of the subway construction it would not go any lower down than was necessary to get under it, would you?

A. No.

Q. When you get to a sewer do you ever use such construction as shown in Complainant's Exhibit 328?

A. It has been used, I have never used such construction. It has been used in the city, I have seen it in the ground.

Q. You did not use any on this uptown job?

A. No, it would not have been any advantage. The points where we were forced down by sewers there were other sub-surface structures there that would have necessitated a special construction throughout, and it would be a very expensive piece of main work.

Q. Such flume work as shown in Exhibit 328 is not in itself an expensive thing, is it?

A. Yes, it is.

5922 Q. More expensive than cast iron pipe?

A. I don't know as to that. I know it is necessarily more expensive, requires more care to make and get tight.

Q. It is lighter, isn't it, and less material in it than cast iron?
A. Per running foot?
Q. Yes.
A. Very much.
Q. That would cheapen it in that regard?
A. In that respect without regard to the method of construction.

By Mr. MATHEWSON:

Q. Referring to this Complainant's Exhibit 328, and the average steel pipe, wasn't it necessary to have several steps made to get the end of this pipe to your main?
A. It was.
Q. And taking the job as a whole, isn't this very much more expensive construction than the laying of a similar amount of pipe?
A. I should consider it was very much more so.

By Mr. KIRBY:

Q. You don't know as a matter of fact?
A. I know as a matter of ordinary judgment that it must be, that the alteration where a subway roof existed necessitates a large expenditure of money, the construction of the iron top alone setting in the concrete.
Q. As for the relative cost of flume and pipe and cost therefor you never made any calculations to balance one against the other to see?
A. I have not made any calculations, no.

At 4.45 adjourned to January 22nd, 1907, at 11 A. M.

Last Exhibits:

Complainant's, 334.
State's, 000.
City's, 236.

5923 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,

vs.

Julius M. Mayer, as Attorney General of the State of New York, William Travis Jerome as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucian L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, *January* 22, 1907.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

5924 Mr. Mathewson: I call attention to the fact that State's Exhibit MMM at page 1658 of the Exhibit Book has a clerical error in printing; it represents as printed, February, 1902; it should be 1905, and so appears in the original exhibit. I have a carbon copy of it right here.

Mr. Burr: I notice on page 1660 the year is given as 1902. Does that have to be corrected?

Mr. Mathewson: That is all right.. Mr. Edgerton compared February, 1902, with December, 1904, and February, 1905.

Mr. Kirby: I will not have a chance to look at that now. If it is not a correction I will let you know.

Walter R. Addicks, recalled as a witness in behalf of the complainant in rebuttal, testified as follows:

Direct-examination by Mr. Mathewson:

Q. Mr. Addicks, Mr. Edgerton presented, and there were put in evidence, three exhibits, State's Exhibit MMM, State's Exhibit NNN, and State's Exhibit OOO, pages 1658 to 1660, inclusive, of the Exhibit Book. I find that Exhibit MMM is indicated as representing 21st Street station, February, 1902, as printed. Is that an error, and what should it be?

A. It should be February, 1905, as appears in the original Exhibit MMM, of which you furnished me a copy.

Q. And generally speaking, the figures there, so far as they are tested, compare with February, 1905, do they not, and 1902?

A. Except as to some errors.

Q. Well, I mean generally?

A. Yes, sir.

Q. Now, take State's Exhibit MMM, representing February, 1905,

and I find a column headed candle power at station, average
5925 24.95 candles. Is that correct for that month?

A. It is.

Q. And gas oil used, 1,756,027 gallons?

A. That is correct.

Q. How about the amount under gas made, which appears on the exhibit at 400,007?

A. It is 400,004 in my copy.

Q. That means 400,004 thousands of cubic feet?

A. Yes.

Q. Is that amount correct which Mr. Edgerton said that he found?

A. It is incorrect.

Q. What do the books show in fact?

A. Carburetted water gas 384,604.

Q. In other words, this 400,004 includes the oil gas made at 21st Street and which is sent to the 14th Street station as well as the gas actually made at the 21st Street station and sent out from there, does it not?

A. Yes.

Q. Now, if this table were correct you should, by dividing the gas used by the number of thousands of feet produced, get the result in the final column showing the gallons per thousand of 4.57, should you not?

A. Yes.

Q. Do you get 4.57 if you divide the gas oil used as stated by Mr. Edgerton in Exhibit MMM with the gas made as stated by Mr. Edgerton in the same exhibit?

A. It would make the gas oil used 1,828,000 when the actual amount used was 1,756,000 gallons; I am leaving the small numbers out.

Q. So that the exhibit does not check?

A. It does not.

Q. Now, take State's Exhibit NNN for identification, representing the 21st Street station for December, 1904——

The WITNESS: May I say that I reversed your question; Mr. Burr will understand that instead of dividing the make into the
5926 gas oil, I multiplied the gas oil into the make, getting the number of gallons of oil. I reversed your question unintentionally.

Q. Take State's Exhibit NNN for identification representing the 21st Street station for December, 1904. I find under the column gas made in thousands 406,366; is that correct?

A. It is not.

Q. What is the amount of gas made?

A. 468,193.

Q. Corrected or uncorrected?

A. Corrected.

Q. That does not include oil gas?

A. No, sir, that is water gas.

Q. Is the average of the candle power at station, 24.83, correct?

A. Yes, sir.

Q. How about the gas oil used, 2,232,181 gallons?

A. That is correct.

Q. Is the 4.77 gallons per thousand made correct?

A. Not as appearing, as dividing the gas made into what we use, 4.77; but 4.77 as a matter of fact is correct so far as the amount used is concerned, but it would not divide out on his figures.

Q. In other words, that figure is taken by Mr. Edgerton from the books as correct as to gallons per thousand, but his figures as to gas made, which should check out, are incorrect?

A. I will say there is no explanation of how he got that figure.

Q. You cannot find any?

A. No.

Q. Take State's Exhibit OOO, page 1660.

A. I have it.

Q. Under gas made, December, 1902, appears in thousands 406,366. That is exactly the same amount as appears for the 21st Street station for December, 1904, Exhibit NNN, is it not?

A. Why, yes; I did not notice that before.

Q. Is it right, for December, 1902?

A. It is not.

Q. What is the amount for December, 1902?

A. I have the amount, 390,777 thousands.

Q. Corrected or uncorrected?

A. Corrected. The figures I have taken are corrected figures.

5927 Q. Are you able to find where for December, 1902, Mr. Edgerton could have got any 406,366?

A. I do not recall it now.

Q. Is the candle power at stations average 23.89 correct?

A. Yes.

Q. Now, as to gas oil used, Exhibit OOO, which Mr. Edgerton introduced shows an amount in December, 1902, of 19,535,338 gallons, is that correct?

A. About 10,000,000 gallons out.

Q. More than that, is it not, about 17,000,000 gallons out of the 19,000,000 gallons out?

A. Yes, 17,000,000 gallons out. I presume the error is in the——

Q. Explain if you can, how the error apparently occurred under the column gas oil used, as it appears in the exhibit?

A. I do not think it is an error of Mr. Edgerton's, I think it is an error of the typewriter. I think you will find the two 3's—between the 5 and 8 you will find two 3's instead of one, so it will read 1,953,538.

Q. That is the amount you would suppose was intended to be put in that column, is it, instead of the 19,535,328?

A. Yes, in that column only.

Q. If you will look at Exhibit OOO for a minute it would appear that on many days the company used 5 gallons, or about that per thousand feet, but on several days here, according to this exhibit they used only 3.58 gallons or 3.64 gallons. That would indicate a great discrepancy.

Q. Was there this discrepancy in fact?

A. No, sir.

Q. Why not?

A. Because Mr. Edgerton omitted to put in all the oil.

Q. What did he omit?

A. He omitted 108,543 gallons.

Q. Of what?

A. Of naphtha.

Q. Have you an exhibit here showing the amount of naph-
5928 tha which should have appeared, but which was omitted in
Exhibit OOO?

A. I have.

Q. Now, introducing this naphtha at the proper dates, the gallons per thousand run substantially uniform for every day in the month, that is, very close to five gallons per thousand, do they not, instead of showing the great discrepancy which Exhibit OOO showed as to gallons per thousand upon the different days of the month?

A. I should think it would be very nearly the same average. There might be some slight differences as compared with the other days.

Q. Now, as a matter of fact, the gallons per thousand as stated in Exhibit OOO, average exactly five. Is that the true average, if you divide the water gas made, the true amount, as you have corrected it, into the oil used?

A. Into the amount of oil used, that Mr. Edgerton said was used?

Q. No, the amount actually used?

A. It is 5.2 and approximately 8, a shade under, I think.

Q. 5.28 gallons instead of 5?

A. Yes.

Q. Now, Mr. Addicks, have you corrected these Exhibits MMM and NNN and OOO in tables that you have, showing the whole thing in toto?

A. Yes, sir.

Q. And you have also prepared for the purposes of comparison a statement made out covering the same point for December, 1905?

A. Yes.

Mr. Mathewson: I will ask you to spread those on the record.

Mr. Burr: I do not know that the statement for the month of December, 1905, is properly rebuttal. Just as counsel stated, it is merely for the purpose of comparison. The corrections which he makes upon the various exhibits are of course concededly proper re-
buttal, but to go into another month and make another state-
5929 ment for that month, in the year 1905, is not, it seems to me,
strictly rebuttal. It is merely for the purposes of comparison,
and that opens up another question.

Mr. Mathewson: It opens up another question, perhaps, which has been brought out by Mr. Edgerton, who claimed that low grade oil would carry candle power just as well as high grade oil, and I propose to show by taking the three months which he presents in these exhibits, that December, 1905, that the drop in candle power between the works and stations varies exactly as the grade of oil you use.

The MASTER: I will allow it.

By Mr. MATHEWSON:

Q. I will first ask for Exhibit MMM, for February, 1905, as it would be if corrected to the proper amount?

A. State's Exhibit MMM, if corrected to true figures, should be as follows:

5930 CONSOLIDATED GAS COMPANY.

21st Street Station. February, 1905.

	Water Gas made M.	C. P. at station.	Gas oil used.	Specific gravity.	Gallons per M.
1	15,680	25.36	69,821		4.45
2	16,091	24.76	81,007	30	5.03
3	15,886	25.10	79,397	30	5.00
4	14,095	24.85	70,793		5.02
5	10,608	25.73	48,808	29	4.60
6	15,042	25.14	68,741		4.57
7	15,486	24.48	77,789		5.02
8	15,167	24.88	67,346	29½	4.44
9	14,353	25.24	69,441		4.84
10	14,618	25.33	66,092	29	4.52
11	13,222	24.98	59,955		4.53
12	8,720	24.52	37,712	29½	4.32
13	13,156	23.84	63,055		4.79
14	16,347	25.27	76,884		4.70
15	15,443	25.05	71,113	29½	4.60
16	14,682	25.10	71,130	29½	4.84
17	14,017	24.75	62,174	29	4.43
18	12,031	24.09	65,636		5.45
19	10,523	25.09	48,953	29½	4.65
20	13,710	25.74	65,513		4.78
21	14,566	26.16	61,113		4.20
22	11,742	25.11	49,481	29½	4.21
23	15,082	24.87	38,860		4.39
24	14,029	24.58	61,090		4.35
25	11,307	24.41	47,528		4.20
26	10,339	24.69	50,318	29½	4.87
27	13,465	24.70	61,487		4.57
28	15,197	24.88	64,790	29	4.26
	384,604	24.95	1,756,027		4.57

Q. Now, have you State's Exhibit NNN?

A. I have.

Q. Containing the correct figures?

A. I have. It is as follows:

5931

CONSOLIDATED GAS COMPANY.

21st Street Station. December, 1904.

	Water Gas made M.	C. P. at station.	Gas oil used.	Specific gravity.	Gallons per M.
1	17,114	24.38	73,501	29	4.30
2	16,135	24.91	77,263		4.79
3	13,937	24.49	68,183		4.89
4	11,407	24.03	56,480	29.5	4.95
5	16,607	24.25	75,595		4.55
6	15,531	24.11	74,814	29.5	4.82
7	16,124	24.37	71,014		4.40
8	16,105	23.75	74,027		4.60
9	16,133	23.61	78,562	29.5	4.87
10	15,505	23.59	78,618		5.07
12	16,100	25.68	74,297	31	4.61
11	12,019	24.42	59,370	32	4.94
13	15,669	25.09	74,034		4.72
14	15,205	25.77	72,917	31	4.80
15	17,345	24.63	79,533	31	4.59
16	16,082	24.90	77,576		4.82
17	14,303	24.31	67,860		4.74
18	10,832	24.82	55,771	30	5.15
19	15,252	25.48	77,200		5.06
20	16,327	25.17	80,414		4.92
21	16,230	25.12	79,306	30	4.89
22	16,513	24.44	80,593		4.88
23	16,848	25.37	78,439	30	4.66
24	15,116	24.34	72,415		4.79
25	11,024	23.83	53,539		4.86
26	11,955	25.48	59,617		4.99
27	16,815	25.98	79,974	30	4.76
28	14,954	25.99	77,193		5.16
29	16,506	25.62	61,760		4.87
20	15,078	25.93	77,871	29.75	5.16
31	13,422	25.85	64,445	30	4.80
	468,193	24.83	2,232,181		4.77

5932 Q. And State's Exhibit OOO?
A. Yes, it is as follows:

CONSOLIDATED GAS COMPANY.

21st Street Station. December, 1902.

	Water Gas made M.	C. P at station.	Gas oil used.	Naptha.	Total.	Specific gravity.	Gallons per M.
1	12,640	26.45	63,418		63,418		5.02
2	12,523	26.74	63,161		63,161		5.04
3	12,991	25.68	65,806		65,806	38	5.07
4	13,847	23.60	70,135		70,135		5.07
5	13,808	23.02	71,322		71,322		5.17
6	12,356	24.44	63,011		63,011	37	5.10
7	12,062	22.30	60,861		60,861	37	5.05
8	14,229	26.04	73,311		73,311		5.15
9	14,099	24.38	71,461		71,461	37	5.07
10	13,687	27.29	70,211		70,211	37	5.13
11	13,543	26.04	71,811		71,811		5.30
12	12,418	25.49	67,561		67,561	38	5.44
13	11,996	23.75	62,461		62,461	38	5.21
14	12,184	23.51	60,571		60,571	38	4.97
15	12,610	23.09	63,111		63,111		5.00
16	13,139	24.43	61,444	4,167	65,611		5.00
17	12,520	26.23	50,787	14,753	65,540	37	5.24
18	11,809	25.87	46,302	19,273	65,575		5.55
19	12,354	24.30	110,622	14,433	125,055	38	5.14
20	11,484	23.48	41,094	16,517	57,611		5.02
21	10,945	23.45	39,836	15,000	54,836		5.01
22	13,434	23.19	50,807	13,583	64,390	37	4.79
23	13,555	25.84	63,411	7,384	70,795		5.22
24	13,300	23.55	63,602	3,433	67,035	38	5.04
25	12,313	22.97	60,683		60,683	39	4.93
26	12,801	21.96	67,215		67,215	37	5.25
27	11,531	21.66	59,949		59,949		5.12
28	10,229	22.09	54,465		54,465	37	5.32
29	11,551	21.50	59,915		59,915		5.19
30	12,272	21.44	59,529		59,529	36	4.95
31	12,547	22.35	65,665		65,665	37	5.23
	390,777	23.89	1,953,538	108,543	2,062,081		5.28

Q. And now, have you the statement for December, 1905, on the same basis?

A. I have. It is as follows:

5933

21st Street Station. December, 1905.

	Water Gas made M.	C. P. at station.	Gas oil used.	Specific gravity.	Gallons per M.
1	18,163	26.72	92,364	34.8	5.09
2	15,755	26.53	74,912		4.75
3	14,226	26.44	67,786	34.4	4.76
4	19,158	26.51	91,817		4.79
5	19,372	26.56	94,532	35.	4.88
6	19,737	26.84	99,086		5.02
7	19,796	26.76	97,686		4.93
8	17,075	26.65	85,711	35.	5.02
9	15,405	26.40	75,181		4.88
10	16,094	26.00	77,589	34.8	4.82
11	17,611	26.69	80,978		4.60
12	18,889	26.63	84,177		4.46
13	19,003	26.80	81,875	34.	4.30
14	19,376	26.51	83,892		4.33
15	18,920	26.73	80,946	34.5	4.28
16	18,238	25.99	83,281		4.57
17	14,861	26.49	71,981		4.84
18	18,210	26.79	82,751	34.	4.54
19	19,739	26.75	89,462		4.53
20	19,808	26.83	88,150		4.45
21	20,608	26.35	94,103	34.3	4.57
22	20,141	26.89	90,409		4.49
23	17,758	26.75	77,545		4.37
24	14,169	25.82	67,817		4.77
25	15,379	26.45	70,663		4.59
26	18,393	26.20	82,855	34.7	4.50
27	19,641	26.58	92,469		4.71
28	18,884	26.39	84,007	34.7	4.45
29	18,699	26.55	82,757		4.43
30	16,922	26.13	65,263		4.43
31	15,009	26.15	63,313		4.22
	555,039	26.51	2,555,358		4.60

5934 Q. Now, taking these four sheets which are just spread on the record for December, 1902, December, 1904, February, 1905, and December, 1905, have you made out a table showing the gravity of the oil used in each one of those months, the candle power at the station, the candle power by the city's test, and the drop between the station average and the city test average?

A. Yes.

Q. Is that it (handing paper)?

A. Yes.

Q. I will ask you to spread this on the record.

A. It is as follows:

Year.	Gravity.	Candle power.		
		Station.	City test.	Drop.
Dec., 1902	36-38	23.89	21.80	2.09
Dec., 1904	29.5-32	24.83	21.08	3.75
Feb., 1905	29-30	24.95	20.06	4.89
Dec., 1905	34.5-35	26.51	23.39	3.12

Q. Now, taking 1902, December, the gravity of the oil was highest, was it not, from 36 to 38 gravity?

A. Yes.

Q. And the station test was how much?

A. 23.89.

Q. The city test averaged how much?

A. 87.80.

Q. And the difference between the average station test and the average city test of how many candles?

A. 2.09.

Q. The next highest grade of oil was used in December, 1905, was it not?

A. Yes.

Q. From 34.5 to 35 gravity?

A. Yes.

Q. And the station test average was what?

A. 26.51.

Q. And the city test?

A. 23.39.

Q. A drop of how many candles?

A. 3.12.

Q. Now, the third highest was in December, 1904, when the gravity ran from what?

A. 29.5 to 32.

Q. And the station test?

A. 24.83.

Q. And the city test?

A. 21.09.

5935 Q. A difference in the average of how much?

A. 3.75.

Q. The lowest grade oil in February, 1905, showed a drop between the average of the station test and the City test of how much?

A. 4.89.

Q. Now, as a matter of fact in December, 1902, to which State's Exhibit OOO relates and where you used 5.28 gallons per thousand even of the highest grade oil, from 36 to 39 degrees, was there in use the present improved Lowe apparatus, or was that the previous apparatus which was replaced?

A. Only in part. There were a large number of retorts making gas in the old fashioned way, making a blue gas and oil gas in retorts and mixing them together instead of mixing them in a carburet*te*r, as in the Lowe type process.

Q. Was that changed after 1902?

A. Yes.

Q. When?

A. 1904.

Q. Now, let us see how that follows out. How many gallons per thousand did you use in 1902, December? 5.28 you said, I think.

A. Your question is with regard to 1902?

Q. Yes.

A. 5.28.

Q. And in 1904, December, you used an oil of lower specific gravity, running from 29½ to 32 only, and used how many gallons per thousand?

A. 4.77.

Q. About half a gallon per thousand less, is it not?

A. Yes.

Q. Was that made possible by your new apparatus?

A. Yes.

Q. Now, take February, 1905, State's Exhibit MMM, the average at that time was 4.57 gallons, a drop of .2 of a gallon below December, 1904, for each thousand feet, was it not?

A. Yes.

Q. And of a specific gravity a trifle lower than used in December, 1904?

A. That is right, 29 to 30.

5936 Q. And that was a period of 20 candle power gas?

A. Yes.

Q. Now in December, 1905, how many gallons per thousand were you using?

A. Only .03 more, 4.60 of the higher grade oil.

Q. And that is, you were using more oil and of a higher grade?

A. Yes.

Q. That was within the period of the 22 candle power gas?

A. Yes.

Q. Do you remember what sort of a month for weather December, 1905, was?

A. The warmest December in 14 or 15 years; 1891 I think was warmer than that.

Q. And what effect would that have on the amount of oil used to produce the required candle power?

A. It should tend to have the minimum quantity of oil for the given month.

Q. Taking up now, Mr. Addicks, the subject of oil, what do you estimate the requirements for oil to be for the companies whose supply is derived from the contract of November 1st, 1905, in evidence?

A. During what years?

Q. 1907 and 1908, the quantity required?

A. 107,420,460 gallons.

Mr. Kirby: This is simply a repetition of the terms of the contract, is it not?

Mr. Mathewson: No, the contract does not specify how much shall be used. Of course the first year there was less oil used and required, and there was less cande power and less sale; and I am simply asking him to estimate the quantity of oil he thinks will be required in 1907 and 1908.

By Mr. KIRBY:

Q. That is the amount you estimate all the companies will
5937 require in the year 1907?

A. 1907 and 1908.

Mr. MATHEWSON: No, one year.

Mr. BURR: That is for each year?

By Mr. MATHEWSON:

Q. From when to when?

A. From one year then to the other. You can take any period you please.

Q. That is for each year?

A. Yes. I think specifically that is the calendar year from January to December. I can give it to you exact if you would like to have it.

Q. Referring to the amount actually received and used, under the contract, can you tell me how many gallons were taken under that contract for the last ten or eleven days, from December 21st to December 31st, 1906?

A. We received 4,604,020 gallons from December 21st to December 31st, inclusive, 11 days.

Q. Now, as bearing on the supply of oil required, storage capacity and other circumstances, will you state what the situation of the company's plants was as to oil within the last month?

A. December 21st we got within six hours of being out of oil at 21st Street station. It was on account of heavy fogs at that time. We had an emergency shipment come in of about 60,000 gallons which would last about fifteen hours. This oil was destined for some other point and happened to be in the river at the time close to the works.

Q. At what capacity was this 21st Street works running at that time?

A. About 20,000,000 cubic feet per day, and the works had to be slacked off, to make less gas.

Q. Was the situation saved by the clearing up of the weather?

A. It cleared off in the afternoon and we got another cargo of oil in. The cargoes were all delayed on account of fogs.

5938 Q. Is this an isolated instance or did a similar situation arise in 1905?

A. A similar situation arose in 1905.

Q. On December 20th, how much did all the consolidated plants combined have on hand in oil as to days, number of days' supply?

A. Estimated, two and a half days.

Q. As to the quantity of oil of course the greater the quantity required to produce a candle power the greater the storage capacity required?

A. Yes.

Q. So other things being equal, is it desirable to have, say, four gallons of oil that cost five cents or five gallons of oil that costs four cents, if they produce the same result?

A. Four gallons that costs five cents is preferable.

Q. There being a smaller amount to handle, a smaller amount of storage and smaller transportation?

A. Yes, sir.

Q. Do you agree with Mr. Edgerton that the specific gravity of the oil has no relation to the candle power that you can produce with it?

A. I do not. It is affected by other things.

Q. So that gas produced by a high grade oil does not carry its illuminating power any better than gas produced by low grade oil?

A. My opinion is it is apt to carry better with a higher gravity.

Q. In reference to Mr. Edgerton's suggestion, or the suggestion of several witnesses for the defense, that the company might make a contract for oil that would yield a lower average price and yet be sure of its supply, what is your view on that subject?

A. My view is that the company could not.

Q. You made the oil contract, you stated, did you not?

A. I did.

Q. Isn't the first consideration certainty of supply?

A. Absolutely.

5939 Q. Who provides the supply and most of the storage and the transportation by rail and the harbor transportation under your present contract?

A. The contractors.

Q. That is, the Standard Oil Company?

A. In this case, yes, sir.

Q. And that relieves the company of maintaining a fleet for the transportation of oil, doesn't it?

A. It does.

Q. What about the storage capacity?

A. It enables a minimum storage to be carried on Manhattan Island.

Q. Would it mean an addition to your capital expenditure if you had to provide these facilities that are now given you?

A. It would.

Q. What would be required, if you will state, if you were to make contracts, getting your oil where you could?

A. There would be the necessity of a fleet of barges and tugboats, and to have certainly not less than three months' supply of oil.

Q. Now, evidence has been introduced here from reports of various companies showing the price that they pay for oil. Do you find any record of the grade of the oil which these companies receive in the reports?

A. I have not had access to the reports.

Q. The evidence discloses no grade as to the oil, does it?

A. Not so far as I am able to learn. I have endeavored, through Mr. Humphreys, to get those reports, but I have not succeeded in getting them so far or in getting access to the reports of the other companies up to date.

Q. You have not yet been able to get them from the Gas Commission?

A. No, sir. We were assured we could get them.

Q. You are still trying?

A. Yes.

Q. In order to illustrate the size and requirements of those companies will you make some illustration, if you have prepared one?

A. I made an illustration of the quantity of oil that we re-5940 received in eleven days of something over four and one-half millions, and how long that oil would last the companies that were spread out on page 5014-A, introduced by the secretary of the Gas Commission. This amount of oil that came to us in eleven days would last the Brooklyn Borough Company six years and nine months, the Kings County Company three years and three months, the New York and Richmond five years five and one-quarter months, Queens Borough Gas and Electric ten years eight and one-quarter months, the Binghamton Company twenty-four years, the Mohawk Company eleven years and three months, the Newburgh Company fifteen years and nine months, the Rochester Company two years and three months, the Fulton Company fourteen years and three months.

Q. And isn't it quite a different proposition where you require such an immense amount of oil from what it would be if you required a few thousand gallons and could skirmish around the country for it?

A. It is.

Q. Now, as a matter of fact, assuming that you would require 100,000,000 gallons of oil in 1907 instead of the 107,000,000 and more to which you have referred, have you made a computation as to what in your judgment would be the expense to the company in maintaining a fleet of boats and storage facilities either in New Jersey or on Manhattan Island and a return on the capital invested per annum which would have to be added to the cost of the oil as now received, if the company were to cut loose from the present contract and skirmish for oil?

A. I have.

Mr. Burr: That is objectionable, I think, in its form. It assumes a great many things; it assumes skirmishing for oil, for in-5941 stance, and a lot of other things that are not, it seems to me, proper, and I do not think it is proper or fair rebuttal; it is a speculative attempt on the part of this witness to prognosticate what might occur in the years 1907 and 1908. Now, as a matter of fact, there might be a great fall in the price of oil that year, and it is a question, and has been a question throughout this whole case, whether by competition, by giving an order for a small part of the oil that the company requires to one company and another part to another company, the Consolidated could not get better prices.

Mr. Mathewson: We will meet that a little later in this testimony. If we got all the oil in the country outside of the Standard Oil Company it wouldn't be enough.

Mr. Burr: And some companies might be willing to deliver the oil in their own barges.

Mr. Mathewson: There are none.

Mr. Burr: Well, that is your statement.

Mr. Mathewson: Well, we will prove it later.

Mr. Kirby: We will have to bring witnesses to rebut a good many of these estimates, I suppose, as to whether or not some other company would build a fleet of barges itself, and pay the storage or not, if they had a contract with the Consolidated.

Mr. BURR: I suppose that we have traversed a good part of the ground already. Mr. Addicks, if I remember, testified he was obliged to make this contract with the Standard Oil because they could not make a contract for so large an amount of oil with the other companies, and he testified that was the best price available, that they were completely at the mercy of the Standard Oil.
5942 That is the fact, according to their contention. We showed by comparative data that other companies in this State and other States along the tide-water received oil for a less amount. They may explain the difference, as Mr. Addicks has tried to explain, that they may not use the same grade of oil, or that for some other reason there is a special exemption as to them in price, but here we are going into the realm of speculation as to what will happen in 1907.

The MASTER: The question has been answered. Read the question, Mr. Stenographer.

The question is now read.

The MASTER: I will allow it.

The State and City except.

Q. You state, in the first place, you would require a storage capacity of ninety days, did you, or three months, to be safe?

A. Yes.

Q. At present where is the storage capacity for the oil which the company receives?

A. Located at the various stations in the borough where the oil is used.

Q. You mean so far as the company is concerned, in the City of New York?

A. Yes.

Q. Well, that storage is limited, as you have stated?

A. Yes.

Q. Where are the storage tanks from which the oil comes which you use?

A. A good deal of it is at Bayonne. That is backed up further by pipe lines.

Q. Do you know of any other storage tanks in the vicinity of New York than the Standard Oil supply—which is ample, isn't it?

A. I do.

Q. What?

A. The Standard Oil is ample to supply us, as shown by the actual supply for years. There are other storage tanks in the vicinity of New York.

5943 Q. Of large capacity?

A. My information is that it is about five million gallons total.

Q. In other words, that is about what you receive in eleven days?

A. Yes.

Q. Would you feel safe to rely on any such storage capacity as that?

A. I would not.

Q. Now, will you give your statement as to what your computation is?

A. With the tide-water storage per gallon, in cents, .53303 cents per gallon.

Q. A little over half a cent a gallon?

A. Yes, sir. With Manhattan storage .6484.

Q. And in making this computation what rate of return did you assume on the capital which would have to be invested?

A. The same as the Gas Commission quoted and Mr. Hughes used in the Stevens' Investigating Committee, 8 per cent.

Q. Now, we will take some of the oil which was to be delivered by these independent refiners who testified on the other side. What did Mr. Emory testify would be the cost of Pennsylvania oil at Jersey City?

A. On page 4827, that 34 gravity oil was quoted at 3.25 cents per gallon, Bradford, plus 1.05 cents for freight, making 4.30 cents per gallon.

Q. Now, that means, as he testified, on the other side of the river?

A. It does.

Q. And that does not include storage, does it, or transportation across the river?

A. No. I would qualify, so far as calling attention to their testimony is concerned, that I think one of the Emorys (junior) stated that the freight included a storage, but not the putting into a tank for use.

Q. Oh, yes, I understand? But not storage in the sense of storage for a gas company in large supplies; and railroad freight rates as given do not include any storage whatever nor do they include the use of cars.

A. The shipper must supply his own cars.

5944 Q. Supposing we get it to Jersey City at 4.3 cents per gallon for 34 degree Baume oil?

A. Yes, sir.

Q. If you add to that the expense per gallon which you have computed, assuming that you have storage in New Jersey where it would be cheaper .533, what would it make the total cost of the oil to the company?

A. Under the date of December 22, 1906, 4.833.

Q. What is the average cost of the oil which you now use?

A. 4.524.

Q. That would cost more than you now pay, would it, on that computation?

A. Yes.

Q. Did Mr. Emory show what the capacity of his works was, or did you compute it?

A. Yes, based on the quantity of crude that they handled and on the percentage obtained, the quantity of 34 gravity oil appears to be 10,080 gallons per day, and in addition to that a 40-degree oil amounting to 1,008 gallons obtained from the oil tar by distillation.

Q. That would be how much?

A. About 11,000 gallons, roughly.

Q. A day?

A. A day.

Q. That would be insignificant in the requirements of the Consolidated Gas Company, wouldn't it, and other gas companies in Manhattan?

A. Well, that would be about 121,000 in eleven days where we receive over four million and a half gallons.

Q. As to the 73 Able, as it is called, of 44½ gravity oil, which it was testified was known as export oil and which it was said was quoted at 4.4 cent in New York, do you understand that that oil can be obtained for domestic use at that price in any quantity?

A. From information and belief, no.

Q. Have you made inquiries to find out?

A. Yes.

Q. It is known as export oil, isn't it?

5945 A. Well, it is oil for export. 73 Able is not used in this country for illuminating purposes, being of a low fire test—and when I say the country I mean in the City of New York—I don't know whether it is used in the country or not. My information is that it is not used in the City of New York.

Q. What is the fire test?

A. Open fire test of 112. 73 Able represents the flashing point with the particular cup which is used for testing the oil. It is a parliamentary standard.

Q. Would it, in your judgment, be a proper thing if you could get it in New York, or a safe thing, to have an oil of that inflammable character stored in tanks to the extent that the company would require it?

A. Certainly not. You are referring now to the three months' supply?

Q. Yes.

A. Certainly not.

Q. Would you expect that the city would consent to the storing of it here?

A. No, sir.

Q. As a matter of fact, what was the quotation for export oil of this character, known as 73 Able, when you made the contract of November 1, 1905?

A. 4.80.

Q. Not 4.40?

A. No, sir.

Q. Isn't it 4.40, including from that time to this?

A. Yes, sir.

Q. That is the average for the whole time?

A. I have it for twelve months as 4.591. That does not include the high 4.80.

Q. No. Well, this quotation of 4.8 cents, or 4.4 cents, is from the Jersey side, isn't it?

A. It is.

Q. And if you could get it in New York, and if it could be got and if the city would allow its use, it would cost, adding the additional expense per gallon which you have described, .533 or .6488 of a cent, how much?

A. As of December 2nd, 1906, based on 4.40, the figure used heretofore in the case, the tide-water storage would be 4.933; Manhattan, 5.048.

5946 Q. It isn't worth while, perhaps, to say much about Texas oil. Mr. Emory's testimony is that it "petered" out, couldn't be had; but Mr. Chamberlain of Ohio appeared here and testified in reference to oil which was not Pennsylvania oil. What was the testimony as to the cost of 34 degree oil of that character?

A. At page 4505 he testified that the price of oil in Findlay was 3 cents; also testified that the freight was a little over 1¼ cents a gallon, based on 22 cents per one hundred pounds; 22 cents per one hundred pounds is 1.56 cents per gallon, so that the price would be 4.56 cents per gallon, and not 4¼ as he stated, for 34 gravity oil. I would like to add, however, that the 22 cents per one hundred pounds of freight is incorrect. It was 21.5, which would make a very slight difference. He probably spoke from memory.

Q. Findlay is on the Pennsylvania Railroad, isn't it?

A. They have connections. I have gotten a freight rate from the Pennsylvania Railroad.

Q. The freight rate specified is to the other side of the harbor, Jersey City?

A. Yes, sir.

Q. And to that 4.56 you would have to add to give the oil to the Company in Manhattan—the transportation and whatever storage was required which you stated would be .53 in one case and .64 in another?

A. Yes, and in addition to that you would have to supply the tank cars if the shipper did not supply the tank cars for 3 cents.

Q. Assuming all these things, how would the cost of that oil compare with the cost of the oil you now get?

A. Well, 4.56 is higher than our average of 4.52, even in Jersey, and conceding the statement that 28 degree oil was worth ¼ cent less than 34 degree, taking ¼c off 4.56 leaves about 4.30. And the price of 28 degree oil is 4.28 in Manhattan and not Jersey, making without any other computation the 28 degree gravity oil higher than we are paying here.

5947 Q. Without storage or transportation on the Jersey side?

A. Yes, sir.

Q. And if those were to be included, what would be the result, larger or smaller?

A. It would be additional by upwards of—well, the figures I gave a little over .5 or a little over .6 of a cent respectively, for the two kinds of storage. I want to say that these figures you know are based on about December, 1906. Mr. Chamberlain's statement was that he sold oil—the last he sold—it is doubtful as to whether his price of three cents was in December or might have been six months away, but the Emory figure was as of December, 1906, as I read the testimony.

Q. Well, taking the cost of the export oil as it was on December 31, 1905, the day before you made the contract with the Standard

Oil Company, it would produce, wouldn't it, for 34 degree Bradford oil testified by Mr. Emory at 5.18 cents a gallon with tide-water storage, or 5.29 cents a gallon with Manhattan storage?

A. That is right. Increasing his figure of 4.30 at tide-water proportionately to the difference between 73 Able at the time he testified and the 1st of November, 1905.

Q. And th- 73 Able or export oil, if it could have been obtained in quantity, would have cost how much?

A. May I finish that answer?

Q. Yes.

A. My figure is, it would cost 4.64 in Jersey.

Q. And the 73 Able or export oil, it could have been obtained in quantity would have cost how much?

A. 5.33, tide-water; 5.44 with Manhattan storage, leaving out decimals.

Q. Let me ask you if these figures which have been produced by the defendant's witnesses and your consideration of them since, have modified your view as to the impossibility of getting an adequate and
pure supply from any other source than the Standard Oil
5948 Company?

A. It has not, sir; it has strengthened it.

Q. Will you elaborate a little on that, and indicate why it cannot be obtained from independent sources to advantage.

A. In the first place you ask me the question in regard to 34 degree oil from the Emory people at Bradford—I should further say that the apparent monthly capacity for 73 Able which they sell entirely at Philadelphia, was 525,000 gallons based on their monthly capacity of handling crude oil, and based on their percentage of 73 Able according to their testimony in one gallon of crude. They stated, however, they sold 750,000 gallons in one month. If so it must have been the manufactured product plus storage. That does not indicate that the Emorys could furnish any substantial amount of 73 Able oil for our use any more than 34 gravity. Mr. Chamberlain does not indicate he had any 34 or 28 gravity oil, but said he would not make any statement as to how much he could sell. In order to determine definitely how the situation stood throughout the United States, I consulted Bulletin 57, Census of Manufacture, 1905, which on page 43 states that the crude petroleum refined was 66,982,862 barrels of crude, of 42 gallons each. At page 8 of Commissioner Garfield's report to the President, dated May 2, 1906, there he states the independent refiners' manufacture of refined would be 11.54 per cent. of illuminating oil, and other oils in about the same proportion.

By Mr. **Burr**:

Q. Have you got that report here?

A. I have, sir. Multiplying 66,982,862 barrels by .1154 gives 7,730,822 barrels of 42 gallons to be manufactured by the independ-
ent refiners. This is equivalent by my computation to 324,-
5949 694,524 gallons of crude. On page 4808 of the testimony
Mr. Delavan Emory, as of December 3, stated that he had ob-

tained twenty per cent. of the 34 to 36 gas oil from 100 gallons of crude, that he obtained one per cent. additional from the tar (see page 4809), and, on the same page, that he obtained 35 per cent. of 73 Able, 21 per cent. of 324,694,524 gallons is equal to 68,185,850 gallons, assumed to be 34 degree Baume gas oil, assuming that every gallon of oil manufactured in the whole United States would yield the exact quantity of this particular gravity that the given quality of Pennsylvania crude yields, which is less than the amount of oil required by the Consolidated Gas Company substantially, by two-thirds, if we could obtain every gallon of it as computed.

By Mr. **Mathewson**:

Q. By two thirds?

A. Less by one-third.

Q. That is, it would be less by one-third if you could get that same result from all the oil in the United States and if you could get every gallon of it here in the City of New York?

A. Yes, sir. Taking, however, the 35 per cent. into the same quantities we would apparently have 113,643,083 gallons of 73 Able, which would be, you might say, just sufficient for our wants if we could get every gallon of it here and at a price.

Q. And if you could get the Able for domestic use instead of for export?

A. Yes, without disturbing the export market.

Q. Did you read the testimony of Mr. Emory that that was quoted for export at the figures given at less than the cost of production?

A. I did.

Q. And have you any reason to suppose that the independent refiners would put it here to you at less than the cost of production?

5950 A. I have no information except general judgment that we would not be apt to obtain it.

Q. Now, in addition to the consideration that you have advanced, the contract with the Standard Oil Company contains a stipulation of their insertion that they would give you this oil at the price stated, the stipulation being that they should furnish to you all the oil that you required, doesn't it?

A. That is my memory of it, yes, sir.

Q. Have you any information that you could get the oil which you required from them at the present price in the absence of such a stipulation as that, to take all you required?

A. That is a stipulation which they insisted on in making a price. Unquestionably the price would be higher if such a stipulation was not there.

Q. And if you could get any amount of oil from the independents would it not be necessary in your judgment to get substantially all your oil from the Standard Oil Company?

A. Yes, unquestionably.

Q. So that if they raised the price by the omission of the present stipulation to which I have called your attention it would be raising the price on the great bulk of the oil you would have to use anyway?

A. My judgment is the oil would certainly cost us more than it does under present conditions.

Q. Is this stipulation one that is inserted in other contracts with you also or in other contracts generally with gas companies, if you happen to know?

A. Well, it is familiar, the provision having seen a number of contracts.

Q. Now, in regard to the price made by other companies for oil, is it possible without knowing a great deal more than the testimony discloses, to make any comparison between their prices and the price of oil that the Consolidated pays—any intelligent comparison that would be valuable in this investigation, in your judgment?

5951 A. Only the comparison that the relation of so many cents bears to so many cents, but that would have no relation to the gas business.

Q. In other words, where oil is quoted at 3½ cents a gallon and it does not appear whether it is 23 degree oil, or whether it is drainings, is it possible to determine its value as compared with 34 degree homogeneous oil costing something over 4 cents?

A. Well, to my mind, it would not.

Q. Referring to the comparisons relating to oil used by the various companies, will you state some of the factors which are involved and which would be essential for comparison?

A. I have enumerated a number here:

First. Is the candle power furnished as stated?

Second. Whether the candle power is taken on a bar photometer or whether on a Lowe jet photometer, or a Jones jet photometer, or a Knox jet photometer, which is similar to the Jones? If taken on a bar photometer, whether the results all corrected for temperature and pressure of atmosphere?

Third. Whether the temperature of the photometer room is normal?

Fourth. Whether the candle power is determined at the station or over a mile from the works?

Fifth. Whether the make of gas is corrected for temperature of the gas passing through the station meter, and if so, how such temperatures were obtained and the number and nature of the readings.

Sixth. Whether results are figured on the make corrected or uncorrected, or on the sales.

Seventh. The percentage of unaccounted-for gas.

Eighth. Are the oil figures based on small supply tank measurements, or on oil meter measurements, or oil storage tank measurements, or on gallons of oil that are paid for? I might say
5952 you may find in some of Mr. Edgerton's figures where he gave
some figures of so many gallons lost.

Ninth. The gravity of oil has a bearing which depends somewhat on the atmospheric temperature; in other words, upon whether the oil which is used produces a fixed gas at all normal temperatures and pressures met with in the given locality.

Tenth. A gravity oil which is obtained by every heavy tar products mixed with light gasolene products must give different results from a homogeneous oil which consists of constituents that by their closer relationship by gravity are perhaps more easily heated are acted upon more similarly by the same temperature, such temperatures as are met with in gas manufacture.

Eleventh. The inspection by sworn inspectors by a public authority, at least a mile from the works, is an influence not to be neglected.

Twelfth. The frequency of such inspections is of importance.

Thirteenth. The penalty for violation, particularly when it is grossly excessive, is of vital importance, since the company must maintain such a safety margin that under no circumstances can the test fall below the standard.

These are some of the influences that relate as to oil and candle power. I have no doubt there are many others that I have not mentioned.

Q. Up the State, if I understood Mr. Emory correctly, there are sections where oil is produced. In other words, Pennsylvania oil, he testified, comes from Pennsylvania and some part of New York State, and a few places in the southeastern part of Ohio. Would not the proximity of the oil wells influence the price of any grade of oil which might be used by a company near those oil wells in New York State?

A. They might.

5953 Mr. Burr: That is purely speculative. He has no knowledge of the working of the mind of the Standard Oil people or other oil producers.

The Master: I do not think I would dwell on that aspect of it, Mr. Mathewson, except in argument.

Mr. Mathewson: No, I do not propose to. I merely wish to show that some of these companies were operating in a region where oil is produced.

Mr. Burr: The Standard Oil Company, according to your own statement, is evidently taking advantage of your situation to get all that it possibly can.

Mr. Mathewson: I think that is according to your statement. I have not made any statement I think on the subject, except to answer yours.

The Witness: I think Mr. Chamberlain showed that his sales were at short distances from wells and low freight amounts and the price of oil was less in that case than it would be in our case. He expressly stated it in cents per gallon.

Q. In addition to what you have stated here, must you not take into consideration the distance from the oil fields, and freight and things of that sort?

A. That should have a material bearing, but the long haul clause might possibly have a bearing as to the price at two places which were quite far distant from a single place.

Q. Doctor Marks made certain comparison of the prices of oil in New York cities, saying he got his information from Brown's Directory, and he gave only a few cities whose average, I think, was 3.65 cents per gallon, wasn't it?

A. I don't recall his figures. That sounds familiar.

Q. Did you find he had omitted a great many towns mentioned in Brown's Directory?

5954 A. I made some notations also from Brown's Directory in the absence of being able to get the information from the Gas Commission.

Q. Will you supply what you got from the same?

A. Yes; Cooperstown, Fort Plain, Granville, Huntington, Patchogue, Port Henry, Port Jervis, Sag Harbor, Saratoga, Suffern and Watertown varied from 4.12 to 7 cents a gallon. Now, dividing the number of towns by the price; it is not multiplying the make and the use of oil and dividing either in that way. The average price of twenty-six companies in 1905, which included all of Mr. Marks' companies, was 4.25 cents per gallon, as against the Consolidated 4.08 cents per gallon in that same year.

Q. And you don't know whether that 4.25 cents per gallon represented oil of 23 degrees gravity or some other gravity?

A. I know nothing about it whatever, except those figures.

Q. As a matter of fact, what is the truth as to the candle power maintained up the State as compared with New York City, according to your information?

A. I had those figures in my mind exactly, but I do not recall now.

Q. More or less?

A. I cannot recall definitely. My impression is it was less up the State, but then the question of where they tested their gas and all the considerations I gave you would make it idle, it seems to me, to make a comparison.

Q. I agree with you. There were four small companies mentioned as operating within the limits of the Greater City of New York: The Brooklyn Borough, Kings County, New York and Richmond, and the Queens Borough Gas and Electric Company. Have you made such investigations as you could in reference to the oil used by them and the result?

A. I have.

Q. Well, take the Brooklyn Borough.

5955 A. In the first place I found that Brooklyn Borough is not tested by the city for candle power as yet. It is a low gravity oil they are using, no gravity is specified, it comes from the Long Island Refinery. According to the report, page 5014-A, that the secretary of the Gas Commission put in, calculated by me, it gives the make and also gives the gallons of oil, showing 5.61 gallons per thousand. They are not using quite that, I think, now. I think it is nearer 5.52.

Q. As against your use of 4.6?

A. Dependent on whether ours is corrected or uncorrected. Uncorrected in one of our works would be as low as 4.27.

Q. And you don't know whether they are maintaining their twenty-two candle power in the absence of inspection there or not, do you?

A. I do not know that they are not. The price of oil to them has been increased over the price that was given of 3¼ cents, I think, to 3.625, an increase of 20 per cent. This oil would be utterly unacceptable to the Consolidated Gas Company. I might add on the question of oil, if you have an oil that drops in candle power, I mean that condenses—you will find that condensation throughout your whole system right up to the burner very frequently, and particularly so in the meters, so that if you have a grade of oil of that description it is not only the question of what the oil costs but irrespective of any inspection by an authority it would be objectionable because of maintenance of the plant outside.

Q. Does that company use any great amount of oil as compared with the Consolidated Gas Company, or don't you know?

A. They only use 670,000 gallons per year, and, as I stated before, our eleven days' supply would last them six years and nine months.

5956 Q. Take the Kings County Company——

Q. Now, take the Kings County Company. The Kings County Company uses in the year how much?

A. They use 1,395,488 gallons, by the testimony heretofore introduced. They are tested by the city; the tests were commenced on August 6th——

Q. That eleven days' supply would last the Kings County Company three years and three months you testified, is that right?

A. Yes, sir. The tests of their gas began on August 6th, 1906, and they have been below the standard of 22 candle since then for that part of August fifteen times, or at the rate of 17.61 for the full month; for September 5 times, for October 5 times; for November 8 times; for December 8 times; a total of 41 times, and allowing for the full month of August, 43.61 times, which would be an average of 8.72 times monthly. If they maintained that average for twelve months it amounts in fines at the customary rate of a thousand dollars if they were required to make 22 candle power gas, to $104,640, which divided into the amount of oil used represents 7½ cents a gallon on fines, irrespective of the amount they pay for oil.

Mr. Kirby: That is all very interesting, but I hardly think it is relevant.

Mr. Mathewson: I think it is pretty relevant, if you undertake to proceed on that theory.

The Witness: The price of oil was 3.125 cents which made 10/625 cents a gallon as the cost of oil under those conditions. I find that this oil is a Texas product of low specific gravity and they stated that when it was cold they sent the candle power as high as possible.

Q. Well, that is the Texas oil that you refer to that has petered out and could not be got any way, Mr. Emory says, in large quantities?

5957 A. Yes. This, I understand, is from the Gulf Refining Company, its refinery is in Texas at Port Arthur. This information I obtained from page 58 of the Garfield Report in May, 1906. They also had tanks at Beverley, as well as at Bayonne.

Q. Is this the company which you said, according to your information, had a total storage capacity in Bayonne or Jersey City of only five million gallons?

A. Yes, sir. The division I understand to be 1,750,000 gallons of gas oil and the rest were refined and fuel oils.

Q. Considering your knowledge of that oil and the results as to candle power, aside from the fact that it could not be got in large quantities, would you consider it wise for the Consolidated Gas Company to purchase it even at the price specified for this other company?

A. My information confirms my judgment heretofore, that I should not recommend the Consolidated Gas Company under any circumstances to purchase that oil, even if the oil was available.

Q. Take the New York and Richmond Company——.

A. Pardon me, I said under any circumstances I mean these circumstances. The New York & Richmond Company, I also consulted the city tests, and I find that they were below 20 candle power.

Q. Well, the tests did not begin there until the 20th of April, did they?

A. That is correct. They were up to candle power in July, and in August they had one failure, September 2, October 1, November 1 and December 9.

Q. How many times in the six months?

A. Fourteen times for the six months, which is at the rate of 28 times a year, which at the customary thousand dollar fine would be $28,000. Dividing that by the number of gallons, 832,405 would
represent 3.364 cents on the price of oil. Adding the actual
5958 price as stated in the testimony, 2.651 makes a total of 6.15
per gallon. My information is that in that case there is no gravity clause, that they obtain what they can, that it is from residual products and heavy material, and they are using now in excess of six gallons a thousand and have also abandoned the use of that oil, and are now obtaining *the* a lighter gravity oil.

Mr. Burr: This is objectionable, of course, the greater part of it, as being merely hearsay, and then again as being entirely outside the widest scope of rebuttal. It is a refinement of calculation that Mr. Addicks has indulged in that has been undoubtedly of great interest to counsel and to himself, but it does not affect the main issue here at all. We might as well assume that they would correct their methods if their methods were not proper in April or in August, and that if for the balance of the year they would be correct, and that they would not have this dropping of the candle power that they had before. It is all a mere matter of consmuption and speculation and is not a rebuttal.

Mr. Mathewson: These are the companies which you yourselves cited, and it certainly shows that the oil they are using is not maintaining their candle power, and as to its being hearsay, it is information derived—and I do not think it becomes counsel to be very technical in that regard, in view of the way in which Dr. Marks and Prof. Bemis presented their information, and inquiries of Mr. Richards of the Boston Gas Company, or Mr. Schaff of the Commission, and asking the secretary or treasurer of the Cleveland Company what they paid for oil, in other words, general information.

5959 Mr. Burr: There is another element that enters into this whole matter, that we cannot diagnose just here, which is, the human element, the man running the works, whether they are run economically or not, or whether the proper use was made of the oil or not, and unless you have that, you cannot make any definite finding on the result of these speculations.

The Master: Do not discuss it further, gentlemen. I will allow the testimony.

Mr. Burr: Exception.

Q. Now, the last of these is the Queensborough Gas Company. Do you know when the candle power tests began in that section?

A. October 22, 1906.

Mr. Burr: My objection lies to all this testimony, Mr. Mathewson.

The Master: Yes.

Q. What is your information as to the gallons of oil used to produce the candle power, say, in December?

A. In December it was 6.51, in October 5.27 and November 5.76.

Q. They did not begin the tests until October 22, 1906?

A. No, and it is shown in the statement on page 5014, my calculation is they were using last year about five gallons only.

The Master: Is my recollection right, that reference was made here, in the course of the defendants' case, to some of these candle tests of Professor Love, or some other candle tests on file in the City department, without making formal proof of them here?

Mr. Mathewson: Yes.

5960 Mr. Burr: We got the candle tests from the books of the Consolidated Gas Company themselves.

Mr. Mathewson: They are available, of course, and are public records, and the public record can be produced if it is considered necessary, but I suppose it is hardly necessary.

The Master: In so far as Mr. Burr's objection goes to the question of competency and that this is hearsay, there may be something in it, unless the fact that the witnesses on the other side used similar sources of information, and they were not put to strict proof.

Mr. Mathewson: They did, undoubtedly.

Mr. Kirby: We used similar sources of information in that; instead of bringing down the City records or Professor Love to testify that the statements in the City records were in fact the results of his tests, we referred to them and gave the tests as purported to be made by him.

Mr. Mathewson: Yes.

Mr. Kirby: So far as saying whether or not this superintendent reported that he had given up using an oil for which the contract was in existence at the time we had our testimony placed upon the record, why we never had a thought, nor did we ever try to put such clearly hearsay testimony.

Mr. Mathewson: You were not here during most of the time——

Mr. Kirby: I have been here since August 18th.

Mr. Mathewson: Testimony was put in freely by Dr. Marks and Prof. Bemis, and over my objection the Master stated it was an equity case and he would accept it for what it is worth.

Mr. Burr: I am not objecting to that so much, Mr. Mathewson, as to the tests of the City; any document you find or state as being the result of the official tests of the City, that is one thing, but when Mr. Addicks testifies that he is informed that they only use so much oil and that so and so is going to be done, that is another matter, and I think that is clearly outside the purview of the case. 5961

The Master: I think that is true. I think that should be eliminated. I think it is proper rebuttal for him to take the same sources, the City tests, that you did, and to show where they would land in the case of these companies you referred to in the course of your defense, but he ought not to interject anything in there which is purely hearsay in the sense of information from officials.

Mr. Mathewson: May I ask whether we are to be excluded now from presenting information which the witness has obtained in the same manner as Mr. Bemis and Dr. Marks obtained their information, inquiries of the officials of companies and investigations? It is utterly impossible to bring the whole nation here, and if you will recall it was admitted for what it was worth over my objection.

The Master: Yes, it was in some sporadic cases, but, of course, the question of whether an elaborate series of calculation based solely on that kind of information should be admitted may be another thing. I am disposed to allow it, as I did the other, for what it may be worth up to a certain amount.

Q. I will ask you——

The Witness: May I say a word?

Q. Yes.

A. These calculations, Mr. Master, are not based on anything that was told me; they are based on the City tests and based on the amount of oil that was put right in the case here on the other side on page 5014. 5962

The Master: I so understood that it was the City tests you were testifying about.

The Witness: Yes, sir; but the amount of oil is already testified about by the secretary of the Gas Commission.

Mr. Kirby: I do not object to any deductions made upon that testimony, nor have I objected——

Mr. Mathewson: And you do not ask us to bring the City test books here which are open to your inspection?

Mr. Kirby: No, no more than you have asked us to bring those books here; but so far as the other statements are concerned, the statements for what it is worth, we should have the sources from which Mr. Addicks got his information.

The Master: We will go on, and if there is any objection to be made it may be more specific.

Q. You know this Queens Borough Company consumes a very small amount of oil?

A. It is only 421,000 gallons used according to page 5014A.

At 1:05 P. M. adjourned until 2:20 P. M.

5963 After Recess.

Walter Addicks resumed.

By Mr. **Mathewson**:

Q. The Queens Borough Gas & Electric Company uses what kind of oil, if you know?

A. Texas Distillate from the Gulf Refining Company.

Q. The same oil as one of these other companies you mentioned?

A. The same as the Kings County, at least I so understand it is the same oil.

Q. Have you the contract between the Queens Borough Gas Company and this Guffey Oil Company?

A. I have (producing paper).

Q. Is this the original contract which you produce?

A. Yes, sir. It confirms the price of oil as compared with——

Q. The time of this contract is between April, 1905, and April, 1906, is it?

A. Yes.

Q. And has it a provision that the liability of the first party, that is, the Gulf Refining Company, of Port Arthur, Texas, ceases when a shipment is delivered to the railroad company?

A. Yes, it does.

Mr. **Burr**: I object to that as irrelevant, incompetent and immaterial. I do not see what bearing it can have.

Mr. **Mathewson**: You have shown they are paying so much for oil, and I am showing the terms under which they get it, and the contract.

Mr. **Kirby**: The contract itself would be the best evidence.

Mr. **Mathewson**: I offer the contract in evidence.

Mr. **Kirby**: I object to the contract as irrelevant and incompetent and not proper rebuttal.

Mr. **Burr**: I also join in that objection.

The **Master**: I will allow it.

5964 Mr. **Burr**: Exception.

Mr. **Kirby**: Exception.

(Paper received in evidence and marked Complainant's Exhibit 335.)

Mr. **Mathewson**: I suppose there will be no objection to substituting a copy, as we have of the other papers.

Mr. **Kirby**: Not as far as I am concerned.

Mr. **Mathewson**: I call attention to the further provision:

"In case of strike, fire, failure of railway or vessel service, as public or private carriers, or any unavoidable act of God, or Providential cause happening to either party of the contract, the suffering party may, at its or their option, suspend terms and conditions of this contract for a reasonable period, and no liability for damages shall attach against either party on account thereof."

Q. Mr. Addicks, as the responsible executive officer of the Consolidated Gas Company, would you consider the making of a contract with any company having those provisions, for the Consolidated Gas Company?

A. No, sir, I should not.

Mr. BURR: Objected to as incompetent, irrelevant and immaterial.

The MASTER: It seems to me that is open to objection. It is a matter of argument. I am capable of drawing that conclusion from facts, if it is warranted.

Mr. BURR: I move that the answer be stricken out.

The MASTER: If you regard it as of sufficient importance we will strike it out.

Q. Now, the Standard Oil Company has a pipe line to Bayonne, has it not?

A. Yes, sir.

5965 Q. So that it is independent of railway transportation?

A. Yes, sir.

Q. Do you know of any other company that has pipe lines to New York harbor?

A. I do not.

Q. Reference was made to Williamsport oil, the price of oil to the Williamsport Gas Co., 3.375 cents. Have you any information as to the gravity of that oil, whether it was below or above 28?

A. The information was that it was about 26, but no gravity, I understand, was specified in the contract.

Q. If it be that, 3.375, what is the freight to Jersey City, per gallon?

A. 15 cents a hundred pounds.

Q. How much a gallon does that make?

A. I approximate it at 1 cent a gallon.

Q. That would make a total at Jersey City of 4.375 on the Williamsport basis, would it not?

A. Yes. Heretofore I gave an exact figure for I think 22—I could figure it out exactly.

Q. Well, it is about that, is it not?

A. Yes.

Q. In other words, would it be more or less than we are paying in New York City for our 28 degree oil?

A. It would be more. That was in the evidence, Mr. Mathewson, the 3.375. I am simply adding the freight.

Q. Testimony was given by Mr. Bemis I think in reference to Lowell, Massachusetts, and the oil which was used there, and he made some observations as to information that he derived. Do you know or have you obtained information as to the candle power that that oil produces per gallon?

A. The information is that it is about 4½ candle power to the gallon of oil.

Q. How much does the Consolidated Gas Company get from its oil in candle power?

A. Uncorrected, with uncorrected gas, from 5.73 to 5.98 in 1905. The corrected would be from 5.42 to 5.74.

Q. In reference to Lowell and the other Massachusetts cities, what is the standard fixed by law for candle power?

5966 A. 16 candle power, and an examination not oftener than once a week, but based on the number of millions of feet sold. The exact amount I do not recollect. And the penalty of one hundred dollars for three successive violations, and no penalty if violation should be twice in succession.

Q. Do you happen to know the gravity of the oil at all?

A. No, I do not recall. I thought I knew, but——

Q. Considering the candle power required and the meagreness of the tests and penalty, what would you say as to the requirement as compared with a city like New York which requires 22 candle power? Would it require a higher or lower gravity of oil in Massachusetts to maintain the same candle power?

A. In my judgment it is very much less important, the question of gravity.

Q. You testified that you were consulting engineer for the Boston companies and chief engineer for some of them, too?

A. Yes. I was chief engineer of all but one, I think.

Q. And Mr. Bemis has testified in reference to the price paid for oil in Boston, and information that he obtained from the officers of the Boston Consolidated Company. What was your information obtained from the same sources in reference to the character of that contract? Does it call for any specified gravity of oil?

A. It either called for no limitation of gravity or a gravity between the limits of 28 and 34; I cannot recall now which that was, but it enabled the contractor furnishing the oil to furnish oil at 28 gravity so far as the contract shows.

Q. The legal requirement of candle power is what?

A. The same as in Lowell, 16 candle, with a penalty for three violations to maintain candle power, but the tests there are 5967 certainly once a week, because the quantity of gas made is such that the inspectors test every week.

Q. And what is your information as to the satisfactoriness of the oil that they are using?

A. Their chief engineer told me they are having a great deal of difficulty with his oil.

Q. Even to maintain the candle power required?

A. To maintain sufficient candle power to enrich his coal gas——

Mr. Kirby: I object to all these answers. "The chief engineer told me"——

Mr. Mathewson: Your own witness, Prof. Bemis, has produced a statement from Mr. Richards, and said Mr. Richards told him——

Mr. Burr: We presented it in the form of a letter.

Mr. Mathewson: Is a letter stating such a fact any more proof than an oral statement? Not a particle.

Mr. Burr: We presented a written document from the Commissioners of Gas and Electricity in Massachusetts, and a letter from the president of this Consolidated Gas Company in Boston, himself. Mr. Addicks says he may have told him a number of things. I do not think it is proper.

Mr. **Mathewson**: The president may have told Mr. Bemis a vast number of things. I do not think you can put in such informaton as that and exclude us from the same sources.

Q. As a matter of fact, Mr. Addicks, do you know whether the gas of the Consolidated Gas Company of Boston is coke oven gas to a considerable extent?
A. I do.

Mr. **Kirby**: I object to this as improper rebuttal.

5968 Q. How much is?

Mr. **Kirby**: I object.
The **Master**: I will allow it.
Mr. **Kirby**: I except.
Mr. **Burr**: I object to it also and take an exception.

Q. I do not care for the exact proportion, but is it a half or such a matter, or more?

Mr. **Burr**: Objected to as incompetent, irrelevant and immaterial and not being rebuttal.
Objection overruled. Exception.

A. During the time I was connected with the company it was a matter of some sixteen hundred million of gas, and from the information obtained from the Boston Gas Company, and I think Mr. Bemis also testified to the same thing from the Gas Commissioner's report, the gas obtained from the New England Gas and Coke Company up to June 30, 1906, for one year, was 2,261,945,000 feet of gas, going to the Boston Consolidated, all of which, however was not used in Boston, some 432,000,000, not exceeding 432,040,000 were sent to auxiliary companies.
Q. Does the Boston company do any electrical business?
A. It does. I was chief engineer of that concern for some time.
Q. From the Massachusetts report to which reference has been made, and from the sales of gas of other companies, is it possible to figure the profit that is made in that direction?
A. It is.
Q. How much is it per thousand feet of gas sold?
A. 4.6 cents a thousand on the gas sold by the Boston Consolidated Gas Company and sold to its own consumers.
5969 Q. What proportion of the assets, according to the Massachusetts electrical report, do you figure is devoted to the electrical business?
A. Something over $700,000, I should say between $700,000 and $800,000 out of a total of $24,366,000.
Q. Of total assets?
A. Yes, sir.
Q. Now, reference was made, or a statement was made, by one of the defendants' witnesses, I think it was Mr. Bemis, that the legal maximum fixed by the Massachusetts statute for the Boston company was 90 cents for its gas which must be of a standard of 16 candle power. Is that correct, according to your understanding?

A. A maximum of 90?

Q. Yes.

A. Yes, I think that is correct.

Q. And it was then stated that the company had reduced the price to 85 cents?

A. That is correct.

Q. Now, have you from Mr. Richards, from whom Prof. Bemis obtained his information, any information as to whether that experiment has resulted profitably or not?

Mr. BURR: I object to it as incompetent, irrelevant and immaterial and not being proper rebuttal. He stated the fact that there had been a reduction. As to the ramifications which may make it unprofitable, that is another subject.

Mr. MATHEWSON: I propose, if I can show it by this witness, as I think I am entitled to under the circumstances, that while it has been reduced, the president states in a public statement to the Legislature or Tax Commissioners that the company, for the fiscal year ending June 30, will not be able to pay 7 per cent., even if it does that on the reduced figure.

Mr. BURR: It will be conceded that not more than six months have elapsed since the reduction, and if this is a report to the Tax Commissioners we have seen various reports and various kinds of 5970 reports to the Tax Commissioners which vary greatly from reports made to other sources.

Mr. MATHEWSON: Well, I have not.

The MASTER: Mr. Mathewson, evidence of that kind does not commend itself to me very much. If we are going to have very much more of it I will have to take up the question and see exactly how far in this record the other side have laid themselves open to the question of opening the door to this kind of evidence. My recollection was that some of the hearsay evidence of this kind which they put was with your consent or without very strenuous objection. Now, if they choose to object to it here and press the objection it puts a different aspect on it. The evidence is all clearly incompetent and of very doubtful value for any purpose.

Mr. MATHEWSON: I do not feel that the original evidence was of very great importance.

The MASTER: I think I so stated when I admitted it.

Mr. MATHEWSON: And if counsel do not intend to argue, here is a company paying large dividends and prosperous on an 85-cent rate, I have nothing further to say on the subject. I am merely anticipating, perhaps, any such argument, and if they are prepared to make it I can show, possibly from the same source that Professor Bemis got his information, that it has not proved a success and that the earnings are showing a very small percentage. That is the situation.

Mr. BURR: I have merely shown that the price, as Mr. Addicks now admits, is 90 cents, the maximum legal price, and that it was reduced to 85 cents. As to whether that 85 cents has proven profit-

able or not, that is also a question as to the manner or method
5971 by which the company has conducted its business.

The **Master**: I have all I can do with the price of New York gas, and the Boston gas does not interest me so much.

Q. I should like to qualify my reply as to 90 cents. I should add that under the law they have a right, while they have reduced it to 85 cents, to increase it to 90 cents whenever they see fit, so they are perfectly safe in the matter.

Q. If they do not like the experiment they can go back?

A. Yes.

Mr. **Mathewson**: Is the question excluded?

The **Master**: I shall exclude it I think.

Mr. **Mathewson**: I will take an exception.

Q. Now, in reference to Lynn, Massachusetts, to which defendant's witnesses referred, that is both a gas and an electric business, is it not?

A. It is.

Q. And is it possible without a complete analysis to make a comparison with a company which is doing a gas business alone, as to the returns which it is procuring, or should procure, upon a proper distribution of charges?

A. Not in my judgment.

Q. Now, Mr. Edgerton, I think it was, made reference to the fact that the Bay State Gas Company, one of the Boston Gas Companies, had a main leading out of its station above ground supported on piles. This was cited as confirmation of the theory that exposed pipes were good things. Do you know about that main, and do you know the results or effects of leaving it exposed?

A. I know the main, but I do not recall that Mr. Edgerton cited it.

Mr. **Kirby**: There was no such testimony.

The **Witness**: He stated that a main close to the surface of
5972 the ground was advantageous for the distribution of gas.

Q. Very well, exclude the assumption that he stated this. I will then ask you on the general question of the effect, of weather on exposed mains as related to the distribution of gas?

A. I have had personal experience with an exposed main. In the case of the Bay State Gas Company of Massachusetts, of which I was then chief engineer, there was quite a distance between the works and where the main entered the public street, which was marshy, and piles were driven and a base put on the piles and a 30-inch main put above that, so it was entirely above ground, a space above and below. The distance, as I recall, was, I think, about a quarter of a mile. We had so much trouble with our loss in candle power in sending the gas through this main that we were not enabled to enrich coal gas at Commercial Point with it, although we started out with 25 candle power. Accordingly we dredged material from the bay and covered this main about three feet deep with earth, and from that time on we had no difficulty.

Q. How deep were gas mains laid in Boston, so far as your knowledge went and under your administration?

A. We endeavored to average three feet in depth.

Q. Was that considered a minimum depth if conditions had permitted, or was there anything that prevented your laying them deeper still?

A. We took the plane that existed above the water pipes and laid our pipes in that plane, if I may use that expression, the water pipes taking a lower plane than our own. If we could have taken the water pipes position we would have preferred it.

Q. What, from your experience and judgment in the gas business, is your judgment as to the propriety of laying mains
5973 as shallow as possible, or with a very shallow covering of
earth, say, eighteen inches from the street?

A. Given no difficulty with traffic, and mains in the south, for instance, where we would have no trouble with frost, I would not object to shallow mains particularly, provided there was enough drainage which could be obtained for the services. But in northern latitudes I should prefer to have them four feet deep rather than three feet deep. It would be better for the distribution department as well as better for the gas, in my judgment.

Q. Reference has been made to the weight of pipe used in the City of Boston, and did you hear Mr. Simpson questioned as to the different weights, or whether they were used at the weights indicated by counsel for defendants in Boston?

A. I did.

Q. Are the gaspipes in Boston as light as that weight?

A. Gas pipes in Boston are heavier than the weights given by Mr. Simpson in New York.

Mr. Burr: When you say pipes you mean mains and services both?

The Witness: No, sir; I am only referring when I make the statement to cast iron main pipe.

Mr. Mathewson: That is what Mr. Simpson was questioned respecting.

The Witness: I have these figures if you would like to have them for comparison.

Q. Very good. What are the figures?

A. The weight of pipe is figured in Boston on the basis of twelve foot for sizes from 4 to 12 inches. In New York, 4 inch is also figured on a 12 foot length, which is 228 pounds, and in Boston 260 pounds. Six inch in New York is based on 12 feet 4 inch
length, weighing 394 pounds, and in Boston it is 400 pounds
5974 on the basis of 12 feet. Eight inch in New York is 543
pounds. Boston it is 600 pounds. Ten inch in New York 703 pounds on a 12 foot 4 inch length, and in Boston 800 pounds for 12 feet. Twelve inch in New York 913 pounds, based on 12 feet 4 inches length, and in Boston 1,000 pounds based on 12 feet. In the larger sizes 16 inch 12 feet 4 inches in New York, 1,406 pounds; in Boston 12 feet, 1,485 pounds; 18 inch 12 feet 4 inches in New York, 676 pounds, and in Boston, 1,800 pounds; 20 inch in New

York, 2,000 pounds, leaving out the question of length, and in Boston 2,100 pounds. The same difference would apply; 24 inch, 2,688 pounds, 2,700 pounds in Boston; 30 inch, 3,887 pounds in New York, Boston, 4,000; 36 inch 5,312 pounds in New York as against 5,700 pounds in Boston.

Q. I want to ask you whether in view of the traffic conditions in the City of New York and the sub-surface structures which have to be dealt with and other features which affect it, you would consider it wise or proper to use any lighter weights of gas pipes than the Consolidated Gas Company is now using?

A. In New York City?

Q. In New York City?

A. No, sir, I would not.

Q. Did you go into the subject when you first came to New York as an officer of the Consolidated Gas Company some years ago with Mr. Simpson as to the weight of pipe and consider the subject carefully at that time?

A. I did.

Q. And was that your conclusion?

A. Yes, sir.

Q. As to the cost of distribution which it has been suggested perhaps could be reduced, has there been any change in the wages which you have been obliged to pay your men within the last few months?

Mr. BURR: Objected to as incompetent, irrelevant and immaterial.

5975 Mr. KIRBY: The same objection, and it is not proper rebuttal.

The MASTER: Objection overruled.

Exception to the defendants.

A. Yes, sir; there was an increase of substantially 10 per cent.

Q. In what departments?

A. In all departments all men receiving less than $2,000 a year.

Q. What was the occasion of this increase?

A. In one of the stations of one of the other companies the men had a meeting with the idea of demanding increased pay, and at one of the shops also in New York they sent a round robin to the management, and the matter had been considered frequently by the management for the last two or three years, realizing the situation that really existed, that the cost of living had gone up and we realized that the demand of the men would be a fair one, and we met the question at once rather than meet a question of possibly a strike and trouble.

Q. How much in total would the increase involve, what additional expense about?

A. It was about $225,000 at the time it was considered. I think that based on last year, 1905, it would have been somewhere in the vicinity of $180,000 a year, which would on the sales at that time be about 1.4 cents a thousand, but I have alr-ady stated previously that the difference in labor cost of .78 of a cent, I believed it would not be maintained.

Q. That was what you estimated originally?

A. Yes, the difference in labor between one period and another, saying that .78 cents would be taken up and probably .62 cents a thousand additional.

Mr. **Burr**: I move to strike out that testimony with regard to the increase in wages, Mr. Master, because it is immaterial and 5976 irrelevant, and it is not rebuttal, and it is plain to be seen that we have been confined here during this inquiry to a certain period very well defined, and were not permitted to go into any other period. If they saw fit for any reason to increase the wages given to affect this inquiry may be 25 per cent., it would have no bearing on the testimony which has been given here all these months as to the situation as it existed during different periods.

Mr. **Mathewson**: You have brought into evidence what would happen in the future as to the Astoria operations and what would happen in the future as to increased sales, and you have done nothing but deal with the present and the future. You have to anticipate the future in any order that is applied here. You cannot deal with the past.

The **Master**: I will allow it.

Exception.

Q. I will ask you whether this increase in wages had anything to do with this inquiry or not?

A. Absolutely nothing in any way, shape or form.

Q. One of the witnesses for the defendant spoke of Huntoon governors——

The **Witness**: One moment. May I add something in regard to the question about the shops?

Q. Yes, if it is pertinent in your judgment.

A. There were ordinarily in our shops between four and five hundred men; in 1905 the company had to discharge 301 men and there resigned from those shops of their own accord 294 men, of which 126 definitely resigned for better positions, making a total change in the shops of 595 men in that year, or more than the average 5977 of the entire number of men employed. I meant to give you the influences that were bearing upon us in regard to that.

Q. In other words, did you find it possible to obtain good men constantly at the prevailing rate before this increase?

A. No, we were met by this situation by the men. Huntoon governors may be obtained of the Wilbraham Green Blower Company of Philadelphia. Such governors have been purchased within twelve months by the Astoria Light, Heat & Power Company.

Q. So they are not obsolete and out of date?

A. They are still used.

Q. Reference was made to the item of a few tons of coke which were charged by one of the Boston companies in the production of gas at $6.23 per short ton. Do you know whether that was an exceptional price for coke, and to what it was due?

A. I do.

Q. Very good, state it.

A. That coke was transferred under my personal direction from the Commercial Point Works of what was then the Boston Gas Company to the Bay State works, to the Calf Pasture works of what was then the Bay State Gas Company. Some three thousand tons were obtained during the coal strike, and we took that at $6.23 at the Commercial Point wharf when coke was selling at that time during the coal strike at $7.50 to $8.50 per ton, and anthracite coal from $15 to $20 a ton, with no customer allowed to receive more than one-half ton.

Q. That explains that $6.23 at that t-me?

A. That was in 1902-03, and the small amount that you see in that following year was simply something that was in the pile and that was used up during the following Gas Commissioner's year, but the vast bulk of it you will find in the preceding year in the report.

5978 Q. Does that represent the usual and ordinary price of coke in Boston?

A. No, it does not, not from the Boston company.

Q. Is the Astoria plant of the company now in operation?

A. It is.

Q. How long since it began to produce gas?

A. The 3rd of December, I think, was the time it started, about 11:50 A. M.

Mr. Burr: The 3rd of December?

The Witness: I think it was Monday, the 3rd of December, at 11:50 A. M.

Q. A suggestion has been made as to oil, that the fact that we make coal contracts with various parties to supply anthracite coal in quantities should be a precedent for making contracts with separate individuals for the oil supply. What is the distinction which governs, Mr. Addicks?

A. Well, in the first place, the customary contract is for all your supply in oil, and in the next place, there are not the people in the market to supply that oil the same as the coal. In the case of the coal companies there are a great many coal companies who can supply a very large amount of coal, but even such companies do not pretend to supply all the coal, nor do they bid for all the coal. They usually bid stipulating not exceeding so many thousand pounds. And as I stated, I think before those contracts are placed not only do we distribute them to the various people who can supply the kind of coal that we want, to wit, West Virginia and Pennsylvania coal, West Virginia being the cheaper coal ordinarily, but also, with reference to the railroad supplying it, as we are dependent entirely upon rail supply, and not upon pipe lines as well. We have to pick out shippers who can supply both by the Pennsylvania and the Baltimore & Ohio, so if there is trouble with one we can get it from the other.

5979 Q. There are a great many large coal companies, are there not, substantially on a parity?

A. Yes, sir. But they do not supply all their product to one person. If they supplied all their coal to us one year and then lost the contract with us they would have no business the next year.

Q. And if you had a contract with a company which operates over one line of railway and there is a strike on another line you are not shut off entirely?

A. No, sir, we get from the other railroad.

Q. What have you to say as to the criticism on the tar and ammonia contracts? How is the company's price governed, I mean the price which it receives?

A. That was governed in the usual way with which I am familiar in such contracts as I recall it. The Boston contract was on the same basis in former years when we had a good deal of tar and ammonia before the coke oven plant started.

Q. The company receives an increased price as the value of the product distilled from the tar or from the ammonia advances the market?

A. Yes, sir.

Q. A sliding scale?

A. A sliding scale.

Q. Mr. Marks referred to certain retorts at Fourteenth and Forty-second Streets not being in use when he examined the plants. Will you state why they were not in use?

A. In 1905 we had coal on hand for fifty-eight days, and this year, on account of the failure of the coal companies to deliver coal, we only had at the same time twenty-one days' supply on hand, and the production had to be restricted to prevent our running out of coal.

Q. That is due again, is it not, to the shortage in the West of bituminous coal, or don't you know about that?

A. That is my information, but I cannot state it as a fact. I believe that to be it.

Q. Is it necessary to shut down or cool retorts out for any purpose in ordinary circumstances?

5980 A. Not when you have a water gas plant to take the variation in the output. If you had all coal gas you would have to shut your retorts down temporarily from day to day.

Q. What about scurfing?

A. Well, it is always understood that a certain proportion of the retorts are out of service constantly to remove the collection of carbon which collects in all coal gas retorts. That amounts in New York practice from 2½ to 3 per cent., probably would never be lower than 2 per cent.

Q. Did you read Mr. Edgerton's testimony that the Fourteenth Street coal gas plant was a dilapidated old plant?

A. I think I heard Mr. Edgerton say that.

Q. What have you to say to that?

A. Well, I think Mr. Edgerton is in error in his statement. I have no doubt, Mr. Mathewson, to cover that statement, if I sent a force to whitewash there Mr. Edgerton would go there and say what a magnificent plant it was.

Q. As a matter of fact, a coal gas plant is not as clean as a water gas plant in appearance?

A. No, it is not as clean, and particularly in the retort house the ventilation is apt to be poor and the coke is all over the place, and not only that, but in a coal gas plant they are very apt to preserve their material by painting it with tar, and if there is anything more distressing than another, it is seeing an entire plant painted with black. It is depressing to the eye. If it were painted with whitewash or a paint of cheerful color he would have had an entirely different impression.

Q. Let us take Mr. Edgerton's depreciation method, without going into many details. How did you find he treated the generators at Ninety-ninth Street, Forty-fourth Street and Twenty-first Street, and when were they installed respectively?

5981 A. I read Mr. Edgerton's testimony that he applied a uniform 10 per cent. depreciation on all the water gas generating apparatus, which included the generator, carburetter and superheater. Well, 10 per cent. would happen to be 5 per cent. for two years on the apparatus that was installed in 1904. But at Forty-fourth Street and Twenty-first Street they were gas generators, that I have ascertained in the case of Forty-fourth Street, they were installed in 1899, and in the case of Twenty-first Street they were installed in 1891, so that his method of application of depreciation seems to me it is not—it is rather peculiar, to say the least.

Q. In other words, in Twenty-first Street there were some generators installed in 1891, some in 1899 and some in 1904, is that right?

A. Yes, sir.

Q. And all those at Forty-fourth Street and Ninety-Ninth Street were installed in 1904?

A. No, there were some—I am wrong, at Twenty-First Street. There is an error in your copy. There were at Twenty-first Street, 12 and 13 foot sets, and they were installed in 1904 and 1899. The 12 foot sets in Forty-Fourth Street were installed in 1904 and the eight feet 6 inches sets in 1899.

Q. And they are all given a depreciation of ten per cent. alike, are they?

A. Yes, sir.

Q. Did you read the testimony of the defendants' witnesses in reference to the single main system throughout the City of New York, its advisability in lieu of the system as it exists now, with duplicate mains to some extent?

A. I think I heard that testimony or read it, I cannot say which.

Q. What would be your view as to the wisdom of a single main system in New York City?

A. Well, applied specifically to the single main system on every street in New York it would be a perfect absurdity. The avenues north and south should all have duplicate mains. 5982 Fourteenth Street, Forty-second Street, Seventy-second Street and similar streets should all have duplicate mains. Where there is a car line, like Eighteenth Street, it certainly should have duplicate mains, and on such narrow streets, I mean the ordinary streets we have and very long blocks, like between the avenues, it is an open question, in my mind, whether it would not be advisable to have a main on each side of the street, it is only a case of cost of installation.

Q. It is a question of just and operating cost?

A. Ye, sir.

Q. In reference to the avenues in some places there are more than two mains on the avenues it appears. Is it not a fact that mains are run on some of the avenues which are known as supply mains, and are not mains from which services are drawn for service on those avenues?

A. The larger mains for furnishing additional gas to the mains to which services are connected, would naturally run on the avenues and on many of the cross streets as well.

Q. The transfer mains?

A. Well, I am not referring to the transfer mains in that case, I am referring to such mains as would give gas to the smaller mains. In addition to that there would be mains required to connect the various works together, which would be pumping mains; they might have a pressure at one time and possibly a slight vacuum at another. It is not wise in my judgment to attach service to the larger mains.

Q. And the smaller mains on the avenues, even if they were set on either side of the street, would not be sufficient to take care of consumers, and at the same time act as supply mains, transfer mains or pumping mains?

A. Certainly not.

5983 Q. In reference to the high pressure, system which Mr. Edgerton advised, I will ask you whether in your judgment it would be either safe or wise or economical to instal such a system in the City of New York?

A. It would not, sir.

Q. In addition to the cost of the mains and governors, which Mr. Edgerton computed at something over four million dollars, would there be any other expenditure?

A. There would.

Q. For what purpose?

A. Installation of the power plant and pumping machinery necessary to supply the gas to the high pressure main system that Mr. Edgerton has testified to, and unless many of our stations should be wiped out entirely, I don't know whether Mr. Edgerton had any idea of concentrating them at one or two points or not; I do not think it is feasible, and I presume he did not—but it would require such plants at our various distributing stations, the larger ones, that would cost a very large fixed charge annually, which would run up into the hundreds of thousands of dollars. I am in the midst of that investigation now.

Q. It would amount then to several cents a thousand on the present output of gas?

A. Yes, I think so.

Q. Reference has been made to the sale of coke. Mr. Doane testified as president of the National Coal & Coke Company and was asked as to whether any thought had been given to the marketing of the coke which came from the Astoria works when they are in full operation. Has that subject received attention from you and the other officers of the Consolidated Gas Company?

A. It has.

Q. Have you from time to time in the past conferred with Mr. Doane and advised with him and in favor of the coke company?

A. I have and for a long period—

5984 Mr. **Burr**: I object. This has become monotonous. Mr. Mathewson puts words right into the mouth of the witness, "didn't you do so and so and so," instead of asking him what he did.

Mr. **Mathewson**: I will ask him now what he did.

Q. I will ask you now what the company has been doing in that regard recently and what they are now doing?

A. We have been having a house to house canvas of every house and block in New York, laying out an entire system to determine exactly where all the fuel is consumed in every part of New York City with the idea in the case of Astoria to displace coal in every place available.

Mr. **Burr**: I submit this is not proper rebuttal, what they have done since the testimony of the defendants with regard to coke, a recent matter that they have evidently instituted an investigation into the situation that exists in New York.

The **Master**: I will allow it.

Mr. **Burr**: Exception.

A. I think it has been under way now a year and a half, so far as the current uses of coke are concerned, the coke business has been cared for by the demand of to some extent by the water gas works, and it has been in addition a question of soliciting. The price of course has to govern, whether we can sell coke against anthracite coal, or not, and the price has been increased or decreased during the time I have been in New York based upon the supply and demand. If we can get more for coke we will increase it, and where we have been compelled on account of the situation to make a concession, we have made concessions at times.

5985 Q. Have you material or advertisements actually prepared in your offices to put out as soon as the Astoria coke is on the market in quantity?

A. Yes, sir.

Mr. **Burr**: I object to what they propose to do to sell their coke in future as soon as they get located in the Astoria plant.

Mr. **Mathewson**: Those questions were expressly asked from Mr. Doane by you or Mr. Kirby as to what was being done to dispose of the Astoria coke

Mr. **Kirby**: Well, he answered that.

Mr. **Mathewson**: I am trying to ask the witness. You do not seem to want information about it.

The **Master**: If you regard this handbill as of persuasive force put it in; I will let you.

Mr. **Mathewson**: No, I merely asked whether they have prepared advertisements and made other arrangements. The answer is what?

The **Witness**: The answer is, yes.
Mr. **Burr**: I suppose it may be assumed they never did before.

Q. In reference to other Massachusetts cities besides Boston and Lowell, to which attention has been called, with the same statement as to price of oil, have you any information in the case of any of those cities, or do you get any from the record as to what their gravity is and the character of the oil otherwise than it is merely gas oil?
A. I don't recall any, Mr. Mathewson.

Mr. **Mathewson**: That is all I have to ask of Mr. Addicks, at present at any rate.

5986 Cross-examination by Mr. **Kirby**:

Q. To whom, Mr. Addicks, is the larger amount of coke sold in the City of Boston?
A. What company?
Q. I don't mean company. I mean is it sold to householders or for manufacturing purposes?
A. The company of which I was chief engineer?
Q. Yes, sir.
A. Householders; that is to say, when I say householders, I mean the current trade, similar trade in that New York.
Q. Do you know to whom the New England Gas & Coke Company disposes of the greater part of its coke?
A. At one time I think the majority of it—I won't say the majority, but the very largest consumer they had probably were the railroads—I won't state exactly. I think they are now selling it less to the railroads and more to others, but I won't state that as a positive conclusion.
Q. Whom do you mean by others?
A. Well, the other sources of coke to whom they sell a lot of it, bagging trade and every other trade, they may have trade outside of Boston, in towns outside of Boston.
Q. Would you consider it a fair statement that they dispose of over two hundred thousand gross tons per year for domestic and industrial services?
A. I will have to figure first, two hundred thousand gross tons?
Q. Yes.
A. What are you referring to now?
Q. 1905.
A. This is gross tons, is it not?
Q. Yes.
A. Two hundred thousand, yes, I should think that would be a high figure.
Q. You think it would be twice as much as the figure which you have in mind?
A. Two hundred thousand would be twice as much as the figure I have?
Q. It would be twice as much as the figure you have in mind?

A. I wouldn't like to say without referring to my notes
5987 as to how much coke that they make.

Q. Then you would be inclined to disagree with the following statement that the large output——

Mr. Mathewson: Are you going to read the statement after you have asked him and he says he thought that was a high figure? Is it proper to then read the statement as though it were evidence and ask him again?

Mr. Kirby: Instead of reading the statement I will ask him this question:

Q. Is it your information that the New England Gas & Coke Company produces as much as four hundred thousand gross tons per year of coke?

A. Well, I figure about 360,000, here on this paper, but I was taking 300 days in the year. There are 65 more days. They might produce 400,000.

Q. And you do not consider that half of the amount produced is disposed of for domestic and industrial service?

A. I thought we were treating the domestic part of it, Mr. Kirby. Now you are introducing industrial service. What do you mean by industrial service?

Q. For other than firing of locomotives, and those uses to which you referred in your first answer?

A. Well, of course, you know that I had in mind that about 60 per cent. of their coke was used by the locomotives. You are, of course, taxing my memory to keep these things in mind. If 360,000 tons would be obtained of this, it was, in my mind, about 60 per cent. of that went to locomotives. Then I said that I thought the locomotive service had been reduced to some extent, but I didn't remember how much.

Q. Then you would not be inclined to disagree with a statement that, say, 150,000 tons were used for domestic services?

A. Now you are talking domestic services and leaving out industrial.

5988 Q. Yes, I am leaving out industrial now?

A. Well, I wouldn't want to take any position on it at all until I knew the source from which the information was given.

Q. Well——

A. As to what weight to give to the statement.

Q. And I will read the statement which Mr. Mathewson has suggested I should not read. I have before me the book issued by the United Coke & Gas Company of New York, entitled "A Short Treatise on the Destructive Distillation of Bituminous Coal," with reference to by-product coke ovens, New York, January 1st, 1906, and on page 101 thereof I find the following statement: "The large output of the New England Gas & Coke Company averaging always some 200,000 gross tons per year were disposed of for domestic and industrial service, a similar amount being used for firing locomotives, particularly in suburban service, because of its smokeless nature."

A. Some of those statements I think are correct. I don't know how accurate the information is from this source, as they are not the people who own the New England Gas and Coke Company, although they are the people who own the patents under which the New England Coke and Gas Company was built. As regards the service in the locomotives I think it is correct; that is, it is used more particularly on local service rather than on long distance service. As regards where the remainder is used, I know in a general way it is used for firing boilers and is used for domestic use in a small way, and it is used in a bagging trade which is quite large. I know the time I was there it was shipped to numerous outside towns, but just what those shipments are I did not at that time know, nor have I since kept track of.

5989 Q. Do you know how many gross tons of coke the Consolidated Gas Company produced during the year 1905?

A. I can't tell you offhand, no, sir.

Q. Can you tell me approximately?

A. No, I don't think I would trust my memory to tell you even approximately.

Q. Do you know how many gross tons of coke it is expected to produce at Astoria each year, or during the first year you are in complete operation with your present installation?

Mr. Mathewson: The first unit?

Mr. Kirby: The first unit.

A. Well, that would be based—I have not made any distinct figures on how many tons will be produced under the ordinary conditions of affairs. I can tell you approximately what would be produced.

Q. What is that approximate amount?

A. Take four thousand million feet of gas on the basis of ten thousand feet to a ton, that would be about four hundred thousand tons of coal, basing one-half ton of coke to one ton of coal it would be about two hundred thousand tons of coke approximately, I should say.

Q. Or just about the amount——

A. The figure which you use. It is a rough calculation and I don't know whether I made on error or not, but it looks that way.

Q. How long has this canvass, this house to house canvass of which you have spoken, been going on?

A. I think for a year and a half, or more.

Q. How many men have you had employed?

A. Only one in that.

Q. An employee of the Consolidated Gas Company?

A. No, he is employed by the Coke Company.

Q. How many men had you employed before that time, or have you no knowledge of that?

5990 A. Well, I have no doubt I have had knowledge, but I have forgotten in the multiplicity of the other things.

Q. This is the first canvass of the kind which has been made within your knowledge?

A. No, I won't say that either, because I have an indistinct recollection in my mind that something similar was done once before, but I won't be positive.

Q. Have you made any effort to find a large consumer such as a railroad company, or factory, or one who would in that way take the place of a large consumer for part of the product of the New England Gas & Coke Company?

A. Well, Mr. Kirby, you are assuming that the coke of the New England Company is the same coke we had over here.

Q. Oh, no, I am not.

A. Well, it is a very different proposition, of course, the proposition of our coke and the proposition of the New England Gas & Coke Company.

Q. That is not quite the answer?

A. Yes, I know it is not. The New England Gas & Coke Company has taken one of our consumers rather than our company able to take their consumer. I think it is due partly to their competition that we lost part of the railroad trade. Now, we have not made an effort up to date to endeavor to have a railroad company use coke in their locomotives, if that is what you mean. We have endeavored, irrespective of Astoria, to get the industrial trade, if I may use that expression—that is to say, the boiler use of coal in New York both for coarse and more particularly for fine.

Q. This house-to-house canvass, I take it, is more for the purpose of obtaining this domestic use in the furnaces or ranges or things of that kind rather than under boilers?

A. Our purpose was to determine just where coal was used, my idea being that it would give us a line on just where we would go to do the best work and the quickest work and the greatest hope of getting business, that is my point of view of it. 5991

Q. So that as yet there has been no real effort made to get the business?

A. Oh, yes, but not the business of the future of Astoria, because we are not ready for it yet. It is useless for me to build up a trade in anticipation and run right out and say we cannot supply the trade when we built it up.

Q. So that one of the chief necessities to establish a good coke business is to always have coke on hand to supply the demand?

A. Well, you want to have it—it all depends, of course, on the size and the constancy with which you make your gas. Now, take this case of the shortage of coal at 14th Street. If you have that condition arise I think it is apt to injure your trade; if you do not furnish your customers constantly when required they have to go outside to get their coke, and it is not a good thing for your trade. Of course, the reverse of that, Mr. Kirby, is true also, and we don't want to pile coke up unnecessarily.

Q. But your efforts will be to do two things, first to obtain consumers for the number of thousands of tons of coke which you produce in each year, and next to produce that coke so there will never be a shortage under the demand that you have at any one time?

A. Yes; particularly if the shortage is in the direction in which it would be an important one to keep the man supplied with his fuel. There might be some places where you could cut off from time to time.

Q. In your criticism of Mr. Edgerton's testimony in reference to a high pressure distributing system, you state that the cost of installing such a system would be great. I presume it also follows that there would be some savings on such a system over one
5992 where gas was distributed at a lower pressure: a small main
under the high pressure will carry more gas than a main of the same size under low pressure, will it not?

A. Well, your statement is correct, but you have two parts to your question. One supposes it is not a saving, and in the next place you say a small main under large pressure will carry as much gas as a large main under low pressure. I know of no saving that would be made by such a system. That is No. 1. No. 2, your statement is correct, that if you put a main under pressure you can carry more gas through that main.

Q. I presume it is also true that the smaller the size of pipe to distribute a certain number of cubic feet of gas, the lower the cost of such pipe or distributing system?

A. That depends entirely upon the amount of attention that is to be given and how often it is to be renewed.

Q. Now, we are coming to the question of maintenance and not installation.

A. Oh, well, a small main may cost more than a larger main to install.

Q. Are you prepared to state that a main carrying gas under a pressure of from ten to fifteen pounds would cost as much as a main to carry the same number of cubic feet of gas under a pressure of from two to five inches?

A. It might.

Q. Are you prepared to state that it would?

A. No, I am not prepared to state that it would. Mr. Edgerton heretofore has discussed, I think, thirty pounds pressure, he has gotten to ten now.

Q. Well, let us say twenty-five pounds.

A. Well, Mr. Kirby, if you take high pressure mains all over the city, of course you are going to add to the capital and you have got to carry a main under pressure in all directions, whether you need it in certain directions or not. I understood this was to effect equalization of pressure. I am talking now about the gen-
5993 eral system. You take a mile of pipe from this spot where
we are, one mile, and put it under twenty-five pounds pressure, and neglect entirely maintenance, neglect entirely increase of capital, everything but the mere sending of that gas one mile, as far as cost of investment in that pipe is concerned, it would be apt to be less than a pipe with a lower pressure made of the same material.

Q. The main for the high pressure gas would be less in diameter, would it not?

A. Less in diameter, yes.

Q. Would it have the same weight as one for low pressure gas?

A. It might or might not.

Q. How high a pressure do you consider that your present mains can carry without danger?

A. I don't think it is safe to carry any more pressure than we are carrying at the present time with our highest pressure main. I would not care to carry much over that. It is not only the cost of a main but the question of the results of an accident in case a high pressure main should be ruptured; it is not a question of the material in the main if it is not ruptured.

Q. Do you consider that a gas main should be more strongly constructed to carry a certain definite pressure than a water main to carry a pressure of the same amount?

A. I never had to compare heretofore the pressure of a gas main with a water main. Under the same pressure gas will leak where water will not, but that is a mere question of the joint and not a question of the main.

Q. Otherwise you see no reason to make a distinction, would you?

A. Well, you are referring now to capital, not a question of maintenance.

Q. No, I am referring to the purchase price of pipe; what piping would cost.

5994 A. I think if you eliminate cast iron pipe and restrict your inquiry to wrought iron pipe and eliminate also the possible accidental leakage from a screw joint, we will say that a wrought iron pipe would carry gas as safely as water of the same pressure, providing, however, there is no corrosion or deterioration of the wrought iron pipe.

Q. Do you know the difference in the carrying capacity of a main of a certain definite size in one instance, where say the pressure is two inches, and in another where the pressure is twenty pounds?

A. No, not offhand.

Q. You have spoken of the 10 per cent. depreciation factor used by Mr. Edgerton on various water gas apparatus. Am I to understand that you consider 10 per cent. depreciation on the apparatus installed in 1904 too high?

A. I should not find any depreciation.

Q. That apparatus has been in use since the time of its installation, hasn't it?

A. Undoubtedly.

Q. How often do you have to reline such apparatus?

A. A portion of it every year.

Q. Do you know how much that relining costs?

A. I haven't it in mind, no.

Q. Do you know what proportion to the entire cost of the apparatus it is ?

A. I can't tell you offhand.

Q. Is there any part of that apparatus which has to be repaired or renewed?

A. It is a regular annual, semi-annual, or every three months possibly, operation; and then carburetter brick might be necessary; it depends on all the conditions and all the service and everything of the kind. That is constantly being done.

Q. Superheater bricks?

A. Not so often.

Q. Well, they have to be renewed?

A. Yes.

Q. And the apparatus does deteriorate?

A. Why, it is as good as it was before when we replaced those bricks. It is a matter of ordinary current repairs.

5995 Q. Do you in appraising an apparatus usually take no depreciation therefrom when certain parts thereof have to be renewed from time to time?

A. I should not ordinarily take depreciation off a piece of apparatus in constant use, it having no evidence of anything but proper care and proper maintenance, for the repairs as ordinarily conducted in the gas business, which is a business which has to have its apparatus in constant good condition to operate twenty-four hours a day.

Q. That is so even if the repairs have not been made or are necessary at the time of that inspection?

A. If I saw anything that specifically required renewal, and there was evidence that the apparatus was not maintained as I am accustomed to see it maintained, why then I should be apt to take note of it, but if it is maintained in the ordinary gas business as I know it must be maintained, why I think that it is fair to assume that the machine is in first-class repair.

Q. Then it would be due to its physical appearance that you would base your deterioration factor?

A. Everything that I could ascertain from an inspection of that, but I don't think that I or anyone else can look at a piece of apparatus which is running apparently perfectly smooth and in perfect condition, bearings in good condition, the machine doing excellent service, and say that has deteriorated so much per cent. It is to me an absurdity, plain and simple.

Q. Assume to your knowledge that the interior had not been cared for, that the renewal of these bricks which you have spoken of had not taken place, and that such renewal was necessary, would you use any depreciation factor there?

A. The renewal bricks you speak of I should not consider in depreciation for a moment. They are mostly normal yearly repair and have nothing to do with the apparatus at all.

5996 Q. And because that would be charged up to your repair account you would not consider it was a depreciation factor on the apparatus?

A. That is, anything that has a normal condition, is in constant use, the machine put together with the idea that that shall be done casually and continuously, I could not consider that depreciation for a minute.

Q. When it requires renewing it is not as good?

A. Perfectly; just as good as though just put up.

Q. When it needs money to be expended upon it to have it in a running condition—

A. Just as good, sir. In fact, it might be better.

Q. Going to the 14th Street, we have some, in fact many retorts there, for the production of coal gas, have we not?

A. Yes.

Q. Are those retorts of the same general character that you have installed at Astoria?

A. Well, I cannot recall whether all the retorts at 14th Street are single length retorts or not. I am inclined to think they are single retorts. If so they have the same general character as far as shape is concerned. The mere question of putting in single retorts or otherwise is a matter that can be done either way.

Q. Are they the same size?

A. No, I think they are smaller.

Q. Which is the smaller?

A. 14th Street.

Q. Why didn't you install that size at Astoria?

A. Well, the size at Astoria is—as a matter of fact, I didn't pass upon the size of the retorts at Astoria.

Q. If you had would you have put in the size at 14th Street?

A. I don't remember exactly what is at 14th Street, and I don't remember the exact size at Astoria. My impression is they are something like 16x26, but I don't remember distinctly. If so, that is a very good size. If the size of retorts at 14th Street is less than that, and the settings would permit a larger retort, I would 5997 be inclined to put in a larger retort, provided the furnaces would burn off the coal necessary to that larger retort. It is a mere question of the size of the furnace and the amount of coke used in the furnace, and how much coal you can burn off.

Q. You have some inclined retorts at Astoria, have you not?

A. Yes, we have.

Q. You consider that a more modern type of retort than the horizontal retort?

A. No.

Q. Why were they installed?

A. The inclined retort and a horizontal retort and a vertical retort were all illustrated in the early history of the gas business away back in 1802, and 1803, as far as retorts are concerned. The inclined retort has been adopted within the past ten years, and it has been installed in a number of places. The horizontal retort, with the modern machinery, is pressing to-day very hard, and I would not like to characterize one or the other as the more modern. As a matter of fact, the two types were installed to determine the best type to use for the remainder of the work. That is the reason they were installed.

Q. Have you any results this far which would lead you to believe that the inclined retort had any superiority over the horizontal retort?

A. Not so far; we cannot tell. If I were asked to state to-day which I would put up in place of the inclined or horizontals, I would not be prepared to tell you.

Q. You would not, however, install such retorts as you have at 14th Street?

A. Certainly not. When you say retorts, I am taking the whole thing, if you say the whole thing includes all.

Q. I mean the whole thing, the stacks of benches as we have it at 14th Street.

A. I don't want to fence with you about it. If you take the whole thing I will say, very frankly, certainly I would not.

5998 Q. I presume you had nothing to do with the contracts which were entered into between the Consolidated Gas Company and the Barrett Manufacturing Company in reference to the sale of tar and ammonia or ammoniacal liquor, did you?

A. I don't think that I had anything to do with the final making of that contract. I knew about it at the time, but I don't recall having anything to do with making that particular contract.

Q. Do you know whether or not any effort was made to obtain a better contract or a contract with other parties than the Barrett Manufacturing Company?

A. Well, I cannot answer that, yes or no. I know I figured on it very carefully myself to see what I could do in the matter personally. I couldn't suggest anything better.

Q. Are you familiar with the current market prices of coal tar or ammonia sulphate?

A. Well, I was thirty days ago, or sixty, but I couldn't tell you now positively what they are.

Q. Your coal is purchased from several companies, is it not?

A. Yes.

Q. And the companies bring their coal into New York over several lines of railroad?

A. At least two, I don't know how many more. I think only two, two general systems.

Q. What two systems are those?

A. I have in mind the Baltimore & Ohio Railroad and the Pennsylvania. I don't know what other lines they might bring coal over.

Q. And you consider that a safeguard which is worth considering in awarding your contract for coal?

A. Yes.

Q. Do you consider that there might be a strike on one of those lines and not a strike on the other?

A. Well, I can't say that a strike on one would not result in a strike on the other.

Q. Was that an element which entered into your consideration in awarding those contracts?

5999 A. Yes, I did have in mind that a strike on one would not necessarily mean a strike on the other. For instance, the Pennsylvania Railroad one time swept off every bridge along the Juanita River. Their traffic was transferred to other roads. That was an incident, you know.

Q. But you would be inclined to have your coal coming into New York over as many lines as possible?

A. Not necessarily as many—a reasonable security. We have a stock of coal on hand, or attempt to, as well.

Q. Your oil comes from Bayonne?

A. I don't know that it does entirely. Some of it may come from Philadelphia. I think those two sources are the principal sources.

Q. It comes from Philadelphia by rail?

A. I don't know; I can't answer that definitely. I know a great deal of it does come from Bayonne, but if I said it all came from there, some of it might come from Philadelphia by tank steamers.

Q. But by far the greater proportion, in your opinion, comes from Bayonne?

A. I should judge so. It is the most natural place.

Q. Do you know how that oil does get to Bayonne?

A. I only know from Commissioner Garfield's report more than anything else. I haven't read it all, but I have read considerable of it.

Q. You have stated——

A. I judge there were pipe lines from there.

Q. You have stated that the storage capacity of this gas oil in tanks of the Standard Oil Company was backed up by their pipe lines?

A. Yes, I knew of their pipe lines there.

Q. Do you know how many pipe lines there are coming into Bayonne?

A. I read it a few days ago, and my impression is there are either two or three into New York City.

6000 Q. Two or three into Bayonne?

A. I think there are at least two into Bayonne, but it would be a question of refreshing my mind.

Q. Coming from the same field?

A. I cannot answer as to that definitely.

Q. Following the same general route?

A. I can't answer that definitely. I will give you the report, if you would like to have the information.

Q. Those pipe lines do not carry gas oil, do they?

A. Well, I presume not; probably carry crude, I should think. I cannot say that they do not any of them carry gas oil.

Q. It is your opinion that they do not.

A. That is my impression.

Q. Now, as a matter of fact, gas companies purchase their oil not from the wells but from the refineries, is that not so?

A. Ordinarily, I think, in the East.

Q. The gas used by the gas companies is not the crude product, is it?

A. No, not in the East.

Q. Is that so in any part of New York State?

A. I don't recall any case where it is true.

Q. Do you know of any large refineries at all situated in the western part of this State?

A. I shall have to again refer to the report. The report gives every refinery there is. I can hand you that if you like to have it.

Q. But it does not necessarily follow, does it, that the close proximity of a gas works to an oil well means it is able to purchase its oil any cheaper than one that would be a thousand miles away but right next door to a refinery?

A. Well, I would be inclined to think the one that was nearest the well would have cheaper oil.

Q. And upon what reasoning do you base your conclusion?

A. If they couldn't get it I should think they could get the crude.

6001 Q. Would you advocate the use of crude oil?

A. Some crude oils I have had very good results with.

Q. Is crude oil cheaper or as cheap as gas oil?

A. We do not buy crude oil to-day.

Q. You do not believe you can?

A. Not in the East.

Q. No, I don't think so either?

A. I am glad we agree.

Q. In building your retorts, your benches, and preparing the same, and in doing work of that character, do you employ your own labor?

A. Consolidated?

Q. Yes, the Consolidated?

A. Well, I can't tell you offhand whether those are their own men or whether they go out and get other men. I don't believe I can answer that question definitely.

Q. What is your impression?

A. My impression is that much of it is done through our men, but whether we go outside and get some of it I can't tell you at the moment. I should think it would depend upon the size of the job. It might be they would have to go outside but the effort would be to do it undoubtedly with their own men.

Q. Wouldn't the effort be to do it as cheaply as possible?

A. Yes.

Q. Now, is it not a fact that you can and have done such work cheaper by doing it under contract than by doing it with your own men?

A. I can't answer that as to the Consolidated Gas Company.

Q. Can you give me the date when this 10 per cent. increase in wages went into effect?

A. I think I can.

Q. When?

A. From memory, on or about the 1st of December, 1906.

Q. Did I understand you in saying that the condition of the streets in New York were worse than that of Boston, as concerns the laying of pipe—gas mains? 6002

A. I don't recollect making a reply to a question that was framed in that way.

Q. What would you say if such a question were framed in that way?

Mr. Mathewson: Do you frame it in that way?

Mr. Kirby: I consider it framed.

A. What is the question?

Q. Do I understand you in saying that the condition of the streets in New York was worse than that of Boston, as concerns the laying of pipe, gas mains?

A. Yes and no.

Q. Now, to what conditions does you- yes refer and to what does your no refer?

A. I think there are some small parts of Boston where it might be just as complicated as New York. Take the very bad part of Boston and the very bad part of New York and on the average New York is a great deal worse than Boston.

Q. The streets of Boston are considerably crookeder than those of New York, are they not?

A. I think if you take the same relative age of the territory—I mean the age of the district, I don't think I should like to differentiate as between the lower part of New York and parts of Boston, because I think I could start in one part of New York and land in the same spot occasionally as in Boston.

Q. Is it not a fact that in laying mains in congested parts of the City of Boston more special joints are needed than in laying mains of the same length in the congested part of the City of New York?

A. Well, in this way, that the congested part of Boston may not be exactly the same character as the congested part of the City of New York. For instance, perhaps the most congested part of the City of Boston is Tremont Street in the vicinity of West,
6003 and Tremont Street is a comparatively straight street there
at that point. It might not require more specials. On the contrary, down around the old north end part, Salem Street and Hull Street, it is pretty crooked. I don't know as it is any more crooked than some streets in New York. They are very similar.

Q. All these weights which you gave for gas mains in Boston, are they the weights of the mains laid by any one company?

A. Those are the weights in Boston proper. There are other weights for the suburban companies.

Q. Now, which company put down these weights that you have first given the weights of?

A. This is for Boston proper and some part—probably some parts of Roxbury there, and Boston proper. I will give you the weights of the suburban if you would like them.

Q. When were those mains to which you have already made reference put down?

A. Well, the date on this is January 27th, 1897.

Q. You mean the date on what?

A. These weights which I have given to you.

Q. Do you know from what source these were derived?

A. This is marked "Approved, W. R. Addicks, Chief Engineer," so that I think I had something to do with it; but the weights of pipe that I give are the weights that were commonly used in the Boston company. There was one exception to that.

Q. You mean by that the Consolidated Company?

A. No, I mean the Old Boston Gas Company for years. One exception is the six-inch main, which, in some cases, instead of weighing four hundred pounds to the length it weighed as much as 460 pounds to the length, but I did not allow any more pipe of that weight to be laid. The other weights were what were nor- 6004 mally used by the Boston company and adjacent towns before I was there, unless it be some little change in the sizes to make it more uniform.

Q. Have you any knowledge of the weight of mains used by the other gas companies in Boston than the Boston Company?

A. Yes, I have; the outside companies, such as Dorchester and the South Boston, I think it was, and it was part of Roxbury.

Q. Are those weights higher or lower?

A. They are lower.

Q. Was the Boston Company the only Boston company which gave service in the City of Boston proper at the time?

A. Yes, sir. No, they were not the only ones. The Bay State had some large mains there, and the Brookline came in with their mains.

Q. And have you any knowledge of the weights of mains as made by the Brookline Company?

A. Not specifically, but in general terms I have.

Q. Have you any knowledge of the cost of the laying of those mains?

A. Not from memory, no.

Q. That main went through some of the most congested streets in the city, did it not?

A. Very little. They did not go into the old part of Boston—the north end district, for instance. They went into the Back Bay, they went into a few of the streets in the West End, they went into the South Bay District, and ran through Boylston Street, and then up in Tremont Street; their office is there; they reached a point up there, but did not go down into the worst part of the city.

Q. And furnished gas to consumers in the vicinity of Tremont Street, did they not?

A. Not further north than West Street, I believe.

Q. And is now a part of the Association, do you call it?

A. Boston Consolidated Gas Company. This is also signed by the Chief Engineer of the Brookline Company, J. A. Gould.

6005 Q. You have spoken of a quarter of a mile of pipe and I think it was 36-inch main?

A. 30.

Q. Belonging to the Bay State Gas Company and running from its works to, I take it, a public thoroughfare or something of that kind, and which main was originally laid along the ground?

A. Above the ground.

Q. Above the ground?

A. Yes, sir.

Q. That the gas, as it entered such length of pipe, had a candle power of about 25 and it lost a considerable part of its candle power in flowing through this one-quarter mile of main. Was that so at all the periods of the year?

A. Well, I said that the gas went to the Commercial Point Works to enrich coal gas, I think you will remember. I don't think I said that was a quarter of a mile. The part exposed, I said roughly, was about a quarter of a mile, but the length of main to the Commercial Point Works, I think, would be about three or three and a half miles. This trouble of candle power was only to an extent; whereas the main we had to cover was due to winter service and not to summer service.

Q. That is, during the summer there was no appreciable loss of candle power?

A. I don't say there wasn't an appreciable loss of candle power, but it was not a loss which made it absolutely essential to do something about, to wit, cover the main.

Q. Was there any more loss there than there would have been if that main were underground?

A. The very fact that we did cover it and had no further trouble with the loss of candle power shows plainly that was so.

Q. And during the month of July one year when it was uncovered and the month of July of the following year when it was covered, how was it?

A. I don't recall what the conditions were in the month of July. It never disturbed me, because it was winter entirely when our trouble was with it.

6006 Q. It was cold?

A. Yes, sir.

Q. If it had been in the South or somewhere where they had no cold, you would as lief have had it above the ground as under it?

A. I think in any pleasant or moderately warm weather; I don't think there would have been very much difficulty with it, no, sir.

Q. Would you have had any difficulty with it I mean, as far as concerned loss of candle power?

A. I won't say there would not have been a loss of candle power. Even wherever the weather could get as low as forty degrees, I won't say there wouldn't be a loss of candle power, and whether it would not be wise to cover the pipe even under those conditions; but under northern conditions it was wise.

Q. Have you any knowledge of what the average temperature of the earth in that part of the city was?

A. Well, I knew that at one time, but I do not believe I can tell you offhand. It is somewhere around 54, I think.

Q. You would not be far wrong in saying 55?

A. I don't know. I am only trusting my memory. I cannot say anything about that. I am speaking now of the average temperature below the frost line. Our mains were frequently surrounded by frost in Boston.

Q. How deep does the frost go in Boston?

A. It varies.

Q. Generally it goes down as low as three feet?

A. I won't say it don't possibly; but I should say it averages a foot deeper than New York, at a rough figure.

Q. Four feet?

A. I think four feet would be exceptional.

Q. Do you remember how great a loss in candle power you found in this three miles of pipe, before and after this quarter-mile section was above the ground?

A. No, I cannot give you the exact figures. I only remem-
6007 ber the fact that during the time that we had it exposed we had to use oil at our Commercial Point Works for enriching purposes for the coal gas in addition to the water gas, which was an expensive piece of business, and after we had covered it we could drop our oil.

Q. Are you prepared to give any reason for this?

A. I simply give the reason that the temperature carried the gas down to such a point that it resulted in the condensation and forced out the hydro-carbons.

Q. And these hydro-carbons being condensed precipitated themselves?

A. Yes, and were pumped out the drips. If they had remained in the gas and been carried on through and mixed with the coal gas they would have reached the consumer.

Q. So the carburetted water gas had to have added to it oil gas in a sufficient amount to keep the candle power of what you required for immediate purposes?

A. No. The oil gas was added to the low candle power coal gas as made in the retorts raising the candle power of the coal gas to a normal condition, and then they added the carburretted water gas. Now, if the candle power is sufficient from the carburetted water gas there is no necessity of putting that oil gas in the coal gas.

Q. What character of gas were you carrying through this pipe?

A. Carburetted water gas.

Q. Unenriched?

A. Oh, no, carburetted water gas.

Q. Enriched to what candle power?

A. 25.

Q. 35?

A. 25. That was about our average.

Q. Would it, in your opinion, have been possible to so reduce this carburetted water gas as to have prevented the precipitation of the hydrocarbons which gave it its illuminating power.

Mr. Mathewson: You mean as they were precipitated in
6008 going through this particular piece of pipe?

Mr. Kirby: Yes.

A. I don't know of any other way of doing this.

Q. The only method you knew of and used was to add more oil so as to raise the candle power?

A. And I said I might cover the main. We covered the main so as to avoid adding that oil. But even with any additional oil our candle power dropped so low that it was necessary to cover the main irrespective of the exact quantity of oil we used.

Q. Where was the holder which contained this gas situated, relative to this exposed section of the pipe? Was it close to or far from it?

A. The holder was not over 500 feet from the meter house, and this gas passed from the holder to the meter house and then out towards the street that I have described. Now, when I come to think of it I think in addition to that 30-inch main being exposed there were parts of the holder inlets and outlets which were exposed in the same way, but I cannot recall just how many feet that was.

Q. As a matter of fact there is generally a considerable piping around the gas holders which is exposed, is there not?

A. I don't recall any ordinarily either in a steel tank or in a brick tank.

Q. The holders themselves were not exposed to cold, were they?

A. Yes.

Q. They were not housed in as we have noted one or two small holders of the Consolidated?

A. No, our holders were a million cubic feet apiece, 1,100,000, and they were too large to house in.

Q. And the holders are not as a rule housed in to-day, are they?

A. Some comparatively modern holders are housed in in New England within my knowledge, yes, sir; and the holders in Boston holding 400,000 and 600,000 feet were housed in.

6009 Q. Comparatively small holders?

A. One three-lift holder holding 600,000 cubic feet and the others were 400,000-feet holders; they were all housed in in the city proper.

Q. For architectural beauty?

A. No, anything but that. They were done that way so they never had to clean the holder from snow, and the gas would go in and out of it without having to constantly change the resistance.

Q. That is due to the weight?

A. Due to the weight of snow, so the works would make into the holder from the station with certainty, and, in addition to that, it took very much less coal to take care of it; less attendance and less maintenance, that was the purpose.

Q. You have spoken of the depth of mains in Boston, and you said three feet. Do you mean at the bottom of the trench?

A. No, I am speaking of the top of the pipe.

Q. I presume the traffic conditions in Boston are just as severe upon mains as they are in New York?

A. There are parts of it where I think it would be just as severe.

Q. There is considerable old cobble pavement in Boston, is there not?

A. Very little of it now. The macadam pavement, there is a great deal of that; that is particularly in the Back Bay district, however, and part of the South End; but in the other parts of the city it is pitch and pebble with a concrete base to a great extent now; large block pavement.

Q. The main purpose of the New England Gas and Coke Company is the production of coke, is it not?

A. Yes.

Q. It sells gas as a by-product?

A. Yes.

Q. You have spoken of the company at Lynn, Massachusetts, and stated it does a gas and electric business, and also of the

6010 Boston company, stating that it does a gas and electric business. In the Lynn company, you have stated, it is not possible to make comparison without a proper distribution of the charges?

A. Not possible for me to make a comparison without knowing how things are distributed.

Q. You didn't have data to your hand to enable you to make such a comparison?

A. No; I took up the question of the Lynn company in a most general way, and dropped it another time outside of those cases.

Q. Now, the Boston company; will you give me the method which you pursued and the basis which you used in coming to your distribution of assets? You stated that over $700,000 of the $24,366,000 of assets is invested in the electrical part of the business?

A. I added those up when I was asked the question.

On page xx, Gas and Electric Light Commission, 1906, Public Document 35. Total assets of the books of the company $24,366,520.14, in which you will find shown the real estate, machinery, etc., as follows:

Real estate, electric	$110,000
Steam plant, electric	150,000
Electric lines	315,000
Transformer	45,000
Electric Meters	47,165
Arc lamps	23,143
Due from electric light and power	16,125

Horses, wagons, etc., I do not recall charging that in, and other gas and electric material on hand, $226,000. A part of that I considered. I only said between seven and eight hundred thousand dollars, because I did not know what it was

6011 Q. And how much of the $226,733.38 given as the value of other gas and electric material on hand did you use as an asset of the electrical business?

A. I simply took a round figure as you see between seven and eight hundred thousand dollars; but I have done it heretofore, it was not in this copy; I thought I would find it here, but I do not. I took the $226,000 out of the $24,000,000 as I remember it, and then took the amount of the electric capital in this and compared it with the total capital and then distributed the same proportion of the $226,000 into the electric and gas relatively. As I remember, that is the way I did it.

Q. What did you think the item of electric lines refers to, amounting to $315,151.90?

A. I should say that was their plant in the street.

Q. In conduits?

A. They have very little conduits. Nearly all over head in Brookline; the only underground is what I think they put in in Beacon Street for a very short distance. They have not even got an underground coming out of their own station where their wires are. Oh, yes, they also — some on Commonwealth Avenue.

Q. You have no knowledge of the accuracy of the distribution of these assets other than that which is contained in the statement?

You take it for granted that the real estate electric, and the real estate gas, with the figures given in this statement, are correct?

A. I think, after an examination of three or four months of the companies, with an idea of capitalization, that those figures were obtained for, late in 1904 and early in 1905, it is a fair apportionment, as I remember it at the time.

Q. Assuming that your conclusion is as has been given will you also state how you arrived at your figure of 4.6 cents per thousand?

A. Certainly.

Q. And what that figure means?

A. The profits from that business were about $130,000.

6012 Q. And where do you get that statement from?

A. I get that statement from Mr. Richards.

Q. How did he give it to you, and when?

A. I think he gave it to me by telephone and confirmed it by letter, I would not be sure. I have it noted by telephone from Mr. Richards on Thursday, August 16th, 1906. I don't know that that refers to every bit of information, because I have a note here that it came from a letter of such and such a date that $130,000 came from Mr. Richards as the earnings for the electric company.

Q. For what period?

A. Gas Commissioners' year ending June 30th, 1906. I also obtained the information that they sold 432,040,000 to auxiliary companies. .

Q. That you obtained in the same way?

A. Yes, I think you will find that Mr. Bemis has used almost—has used these same figures, but I will not be sure about it.

Mr. Bemis: Substantially so on gas.

The Witness: Yes. They bought that from the New England Gas & Coke Company for 23 cents and sold it to the auxiliary companies at 36.02 cents. Now, I did not take the difference between 23 cents and 36.02 cents as their profit, because I happen to know from my knowledge of the company that all the gas obtained from the New England Gas & Coke Company is purified by the Consolidated Gas Company, so if they sell that gas to auxiliary gas companies they expend on it the purification, which with them amounted to 5.91 cents per thousand for purification and handling. So I added that amount to the 23 cents and took the difference between those two amounts, what it cost them for their gas and what they sold it to auxiliary companies, and obtained a profit on that amounting to $30,718. That added to the $130,000 made

6013 $160,718, which divided by the amount sold to the private consumers in the city and including what was used in their own works, which was 3,497,482,000 feet, gives 4.6 cents a thousand.

Q. Where did you get your figures dealing with the cost of purification?

A. I had general knowledge of that from my own knowledge previously and this exact figure was given to me by Mr. Richards, so I am quite familiar with the figure.

Q. Which figure did he give you?

A. 5.91.

Q. He gave you the cost per thousand?

A. For purification and handling.

Q. What do you mean by handling?

A. Oh, well, they took it into their gasholder and sent it out from their gasholder.

Q. Have you the two figures which went to make up that total of cost of purification and the cost of handling?

A. No, I have not.

Q. Your general knowledge would tell you that the cost of handling and the cost of purification would come to that amount?

A. Between six and seven cents, possibly a little over seven cents. I have the exact figure of that in 1905, when I investigated the Boston situation. I have it down to dollars and cents, and if you would like to have it I will give it to you.

Q. Is that cost of purification generally the same as it would be, say, in the works of the Consolidated Gas Company?

A. Oh, no indeed, not for a minute.

Q. Is it higher or lower?

A. Away beyond it.

Mr. Mathewson: What is away beyond it?

The Witness: The six or seven cents.

Q. And why is it so abnormally high?

A. Because you are having Dominion coal which is simply impregnated with sulphur from end to end, and you have to use
6014 lime for purifying. You have to have three sets of purifiers. You have to have a twenty-grain limitation by law on sulphur, and you have to put up lime purifiers and take out every trace of carbonic acid, and have to have lime boxes which have been fouled by sulphur, sulphide boxes, to take out the bi-sulphide of carbon, and then you have the boxes after that the same as we ordinarily use in the gas works in New York for water gas, the oxide boxes, and it is a very expensive operation.

Q. Does this operation free the gas from carbonic oxide?

A. Yes, substantially it does.

Q. And from carbonic acid?

A. Did I say carbonic oxide in that other statement?

Q. Yes.

A. I meant to say carbonic acid. It does remove substantially the carbonic acid, the lime does.

Q. And this information also came in over the telephone?

A. That I am giving to you now?

Q. The 5.91, is it?

A. 5.91, yes; and I think—I won't say that that particular figure was confirmed by letter, but I think so. It is substantially correct, anyhow. I might as well tell you, Mr. Kirby, if I had not that figure I would have simply subtracted 23 from the average, say 36, and got a larger amount to take off and made it more than 4.6, but because I knew the purification item, I did not do it.

Q. You divided the 4.6 up into the profit on the electrical business by dollars?

A. No; I divided the profit of the electrical business, plus the

profit of the auxiliary gas company business, and divided it by the sales, the sales in Boston of the Boston Consolidated Gas Company; in other words, if they had not had those sources of return they would have had to have 4.6 larger profits on the gas that they sold in order to pay the same dividend; that is the only point I
6015 am bringing out. They could not have sold gas for the price at which they did, an average of 92.15, and make the profit they did and pay the dividends they did. They would have had to have 97.7 cents.

Q. Then you consider it a valuable auxiliary to have an electric plant as part of the business?

A. Well, I certainly would be very glad indeed. I don't think there is any gas plant to-day that would not be very glad to have an electric plant, whereas twenty years ago they did not want to see them. Now they would be very glad to have them, but there is no electric plant in our case, if you will remember, Mr. Kirby, there is no capital involved in it.

Q. How did you get your information as to Lowell, Massachusetts, in reference to the candle power of the gas, and the amount of oil used?

A. I got it from the superintendent.

Q. In what manner?

A. I got a telegram from him; I telegraphed him and got a telegram from him. I want to say, Mr. Kirby, as a sad thing at this time, that the superintendent died on the 3rd of January.

Q. How did you get your information as to the character of the oil used at Williamsport?

A. I asked Mr. L. B. Gawtrey if he could give me some information in regard to this.

Q. And he got it; he told it to you?

A. Yes, he told me that—he found that there were no gravity requirements.

Mr. MATHEWSON: He has not been connected with the company for a considerable time, Mr. Kirby; he and his associates have sold out long ago.

The WITNESS: He still knew the superintendent, however, or manager.

6016 Mr. MATHEWSON: Yes, but he is not a manager or director of the company or even a stockholder now.

Q. You are not aware how he got the information?

A. I think he went to the present owners and got it that way. He did not remember what it was when I asked him.

Q. Some one told him and he told you?

A. Yes, that was the best information I could get.

Q. Who informed you that the gravity was 26 degrees Beaume?

A. I think I asked Mr. Higgins about that and also confirmed it in any way.

Q. Mr. Higgins is who?

A. Of the Standard Oil Company. My impression is he told me it was about 26, I will not be sure whether Mr. Gawtrey told me that or Mr. Higgins.

Mr. **Mathewson**: He is the one who had the correspondence with the Danbury man.

The **Witness**: Yes, the man who wrote the letter which was produced here.

Q. You knew Mr. Higgins before you knew he had written to Danbury?

A. Yes, I tried to find out what I could.

Mr. **Mathewson**: It was put in evidence.

Mr. **Kirby**: Yes, marked for identification.

Q. Did you also obtain from Mr. Gawtrey the freight rate from here to Williamsport or from Williamsport here?

A. No, I got that from the Pennsylvania Railroad.

Q. Did Mr. Gawtrey and Mr. Higgins inform you where the oil was shipped from which went to Williamsport?

A. Yes, I think Mr. Higgins said so.

Q. And what did he tellyou?

A. That it came from Philadelphia.

6017 & 6018 Q. And was it shipped from Philadelphia to Williamsport?

A. Yes.

Q. Do you know the distance from Williamsport to Philadelphia?

A. No.

Q. Do you know the difference in distance from Williamsport to Philadelphia and from Williamsport here?

A. No, except I know one is 90 miles, I don't know how far the other is.

Q. You know that Philadelphia is 90 miles from New York?

A. Yes.

Q. Do you know the difference in freight rate from Philadelphia to Williamsport and from New York to Williamsport?

A. No.

Q. You have added to the price of the Williamsport oil a freight rate from Williamsport to New York, have you not?

A. Yes.

Q. If someone were purchasing this oil in New York do you think they would ship it from Philadelphia to Williamsport and from Williamsport to New York?

A. No, but I assumed it would come from the Philadelphia fields and not from the Texas fields. I believe it was Texas fuel oil, the oil that was used.

At 5 P. M. adjourned to Wednesday, January 23rd, 1907, at 11 A. M.

6019 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; **WILLIAM TRAVERS JEROME**, as District Attorney of New York County, **FREDERICK E. GUNNISON**, **JOHN C. DAVIES**, and **LUCIAN L. SHEDDEN**, Constituting the New York State Commission of Gas and Electricity, and **THE CITY OF NEW YORK**, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *January* 23, 1907.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

6020 **WALTER R. ADDICKS**, resumes the stand and further testifies:

Cross-examination by Mr. KIRBY (continued):

Q. Last night, Mr. Addicks, we were speaking about your coal coming in over at least two railroad lines. Your oil, I take it, comes in over the pipe lines of the Standard Oil Company, does it not? Comes to the coast in that way, does it not?

A. I presume it does. From all the information I have it does, Mr. Kirby. It comes some by rail as well, for aught I know.

Q. And you consider, I presume, a pipe line a cheaper means of transportation than by rail?

A. I don't know anything about that. I know, in a general way, about it, but the matter does not concern me at all.

Q. Then you do not consider it a valuable or an important point that the Standard Oil pipe line makes the Standard Oil Company practically independent of railroad rates?

A. As a matter of certainty of supply it is very valuable, but when it comes to how much of it goes through the pipe line or how much by the railroad, I have only the information I can obtain from Garfield's report. I have no other information.

Q. And you would still be of the same opinion of the importance of the pipe line if the cost of transportation by that line were greater than by railroad?

A. Yes, certainly, as far as certainty of supply is concerned; so much additional facility for getting oil.

Q. You have given us certain information, relative to the cost of oil, of the various three or four other gas companies in the City of New York, the gravity of that oil, the amount used per thousand cubic feet of gas produced, and so forth. Will you tell us 6021 in what manner you obtained that information? Was it told you, and, if so, by whom?

A. Yes, I talked with the managers of the companies.

Q. And such information was given to your individually?

A. Yes, sir; more or less.

Q. What do you mean by more or less?

A. I mean to say I got more information from some than I did from others.

Q. But it was all obtained in that way?

A. Not all obtained in that way.

Q. What was not obtained in that way?

A. Well, you ask the particular thing, and I will tell you whether I obtained it in that way or not.

Q. Here we have the Brooklyn Borough Company. You state that they use, if my notes are correct, 5.61 gallons per thousand; from whom did you obtain that information?

A. Mr. Macy in person; confirmed by memoranda.

Q. Memorandum taken by you?

A. No, sir; by Mr. Macy.

Q. You also stated, in regard to the Brooklyn Borough, that the price of their oil had been increased; how did you obtain that information?

A. Mr. Humphreys told me so.

Q. Do you know how he knew—you mean Mr. Humphreys of that company?

A. Yes. He is manager of the company. I suppose he knows.

Q. When we speak of Mr. Humphreys here we mean——

A. I talk of Dr. Humphreys then. I don't know as he is any relation or not.

Mr. Mathewson: That 5.61 gallons also appears in one of the State's Exhibits, from the figures.

Mr. Kirby: Very good, then.

The Witness: Mr. Kirby will find the number of gallons does not appear—may I correct you, Mr. Mathewson? It does 6922 not appear in the State's Exhibit, but the number of gallons of oil appears and the number of feet of gas appears, and it is a matter of dividing the one by the other, but it does not appear as 5.61.

Mr. Mathewson: But it is to be deduced from the figures already in evidence.

The Witness: I referred to that yesterday in my testimony.

Q. How did you obtain your information of the oil used by the Kings County Company, and the Texas product?

A. I obtained it from the State's Exhibits.

Q. And also that it was furnished by the Gulf Refining Company?

A. No, I talked with the manager of the company.

Q. How did you obtain the storage capacity of the Gulf Refining Company?

A. I asked a personal friend of mine who had knowledge of the situation there, and I asked him what the storage capacity was, and he told me he thought it was about that, and I stated that same thing.

Q. Have you any knowledge as to where the Western gas companies mentioned in the State's Exhibits purchased their oil from?

Mr. Mathewson: Which State's exhibit is that?

Mr. Kirby: The State's exhibit giving the amount of oil and price thereof, the one to which reference has been made, the one stating the number of gallons of oil used, the number of cubic feet of gas produced, the one put in by the Secretary of the Commission—I mean the Western New York companies.

A. I don't know whether I can really state where they do get it from. I don't recall at the moment.

6023 Q. You have no knowledge of freight rates to these points of the use of gas oil, from the place of purchase, have you?

A. No. The information is given in the Garfield report, various freight rates from various points, I know that, but I have not had occasion to use it.

Q. Referring to page 5951 of your testimony, where you give the factors which you consider are involved in the comparison relating to oil used by the different companies, I note thirteen factors.

A. Some of the factors.

Q. Referring to the second one specifically, "whether the candle power is taken on a bar photometer or whether on a Lowe jet photometer, or a Jones jet photometer, or a Knox jet photometer, which is similar to the Jones? If taken on a bar photometer, whether the results are corrected for temperature and pressure atmosphere?" On what kind of a photometer are the tests of the Consolidated Gas Company taken?

A. The recorded tests, on a bar photometer.

Q. Those tests which are set down in your statement on pages 5934, 5933, 5932, 5931, and 5930; have you any knowledge as to how the candle power at stations was obtained? Was that by the use of the bar photometer?

A. Yes, I think that is true, Mr. Kirby.

Q. And do you know whether or not they were corrected for temperature and atmospheric pressure?

A. I think they were, but I don't know how far back they were. I don't know about 1902, but I think you will find the record of 1904 and 1905 corrected. I won't say as to 1902.

Q. Do you know as to December, 1905?

A. No, I can't tell you definitely. I think they were all corrected.

Q. Do you know how such tests are made by the city?

A. Yes.

6024 Q. How are they made?

A. They are corrected for temperature.

Q. Are they taken upon a bar photometer?

A. Yes, sir, I so understood it. They would be worthless if they were not. The law requires it so, I suppose they are obeying the law.

Q. Do you know whether the tests at the city stations and at the works of the Consolidated Gas Company were taken with the same kind of apparatus and in the same manner, with the same corrections and with the same kind of a burner?

A. Well, I think they are. I think they are both—whether they are both 100-inch bars or not I cannot say; some may be 60, some 100. I think they are taken with the same number of Bray burner; if I recall correctly it was No. 6. That burner is not the same as used in Massachusetts. In Massachusetts they use the Sugg table top burner, which is either No. 5 or No. 6, so they differ in that respect, and with lower candle-power of coal gas in Massachusetts they use the Argand burner, but I think the practice in New York is not to use the Argand burner under any circumstances.

Q. The tests for candle-power in New York City are, of course, for candle-power above 20 and have been for many years back?

A. Yes.

Q. Then you are not positive that the tests are made in the same manner, but are not prepared to state they are not made in the same manner?

A. I have not specifically examined the record in regard to the tests you refer to. If I had examined them specifically I would say unhesitatingly, yes, but as I have not specifically examined them I qualify it to that extent. I have no doubt they are the corrected candle power.

Q. You consider they are close enough in their method to use as a basis of comparison between candle-power at the station and
6025 candle-power at the works, do you not?

A. Well, they are the records that are on record, as exhibiting the candle-power. I am merely taking the conditions as they appear.

Q. You have used such tests in the table which you here presented, have you not?

A. Yes, I have simply taken the records that Mr. Edgerton has put into the case. He put the candle-powers in himself, and I have taken those and added the candle-powers taken by the city, and used those put in by Mr. Edgerton and by the city.

Q. Mr. Edgerton put in no table for December, 1905?

A. No; with that qualification.

Q. That is entirely prepared by you?

A. Yes, it is simply a copy of the same report that Mr. Edgerton was supposed to put in. He made a comparison originally in that same way, and I simply followed his lead.

Q. Going to our fifth factor here, "whether the make of gas is corrected for temperature of the gas passing through the station meter, and if so, how such temperatures were obtained and the number and nature of the readings?" I take it that the production of gas at any station, as given by the Consolidated Gas Company, is not merely the reading of the station meters, but that it is the reading corrected to what it would be if the gas, instead of being at the temperature where it was when it passed through the meter, was at the same standard temperature assumed by you?

A. Sixty degrees.

Q. Sixty degrees Fahrenheit. What is the average temperature of gas as it passes through the station meter in the works of the Consolidated Gas Company? Is it above eighty?

A. I don't recall, Mr. Kirby, what the temperatures are; they were different for different works.

Q. Would you think it was higher than eighty in any one instance?

6026 A. Well, if the thermometer was one hundred degrees in the summer, it might readily be above eighty.

Q. Then the outside temperature has considerable effect upon the gas as it comes from the gasmaking apparatus and passes into the holder?

A. I think it has some effect, yes. You have all the windows open in the summer. In the winter perhaps it may or may not have an effect; it depends on how thoroughly the various buildings are maintained in temperature by artificial means.

Q. Would gas coming directly from the gasmaking apparatus be as quickly affected by outside temperatures as to have some decided effect upon the temperature of the gas as it passed through the station meter?

A. Well, the effect—won't you read that question?

Question read by stenographer.

A. I don't know whether you intend to cover as broad a field with that question as you would seem to, to my mind. Will you put that into another form so as not to make it quite so complicated in its reply. I will explain to you why, if you want me to.

Q. What would you consider the temperature of gas would be as it comes from the gasmaking apparatus before it passes through the station meter or before it starts on its way to the station meter?

A. 1600 degrees; in a water gas plant.

Q. Now, it loses a very large part of that temperature, does it not, before it gets to the station meter?

A. Yes.

Q. So that if there were no atmospheric influences, no change of temperature, rather, assuming, say, that the temperature remains constant at 60 degrees?

A. In the atmosphere?

6027 Q. In the atmosphere; what would you consider the average temperature would be when it reached the station meter?

A. Well, of course, that depends upon what you condense and what your scrubbing capacity might be for a given make of gas.

Q. Well, in a properly proportioned plant?

A. And in the winter?

Q. I say we will assume outside temperature of 60 degrees?

A. Yes.

Q. Constant?

A. Then I am inclined to think it would be—of course, it is hypothetical, but I am inclined to think it would be somewhere between 60 and 70 degrees.

Q. If instead of having an outside temperature of 60 degrees we had an outside summer temperature of 100 degrees, or even more; would the temperature of that gas be materially increased?

A. I don't know.

Q. Then you are not as strongly now of the impression as you were a few moments ago that the outside temperature would have considerable effect upon——

A. Just as strong.

Q. Would it or would it not have it?

A. I think it would have an effect, but you asked what the average temperature would be. I never met with just those conditions, and I cannot recall exactly what the effect would be with 100 or 120 as constant temperature, or even 90.

Q. Would it raise it two degrees, do you think?

A. I really don't know what effect it would have. It would depend on how much water you use in the condensers, how close your meter was to the condensers, as to how quickly you measured it after the gas had been condensed to any temperature that you choose to carry it. If you choose to carry it down to sixty you would have to have water for this outside temperature. If you could have water of such a low temperature that you could bring it to sixty, 6028 and if you should measure it at once you would have the measurement of sixty, it wouldn't make any difference what happened to the gas after it passed to the meter.

Q. The outside temperature, however, you consider has a material effect upon the gas as it passes to the meter?

A. I think the average temperature, as a rule, of gases in the summer time would be higher than they were in the winter time in any well regulated gas works.

Q. That is due to the temperature of the outside air?

A. That is due to the fact that the temperature of the outside air is higher in summer than it is in winter.

Q. Is there any other point in the distribution of illuminating gas where the amount thereof is measured by the meter?

A. Yes.

Q. Where is that?

A. On the premises of the consumer.

Q. Is that corrected for temperature?

A. It is not.

Q. Have you ever made any investigations to ascertain what the average temperature would be of the gas passing through the consumer's meter?

A. I have.

Q. Is it above or below 60 degrees?

A. I will qualify that statement—not of the average gas passing through, but what the temperature was in some particular cases.

Q. Yes.

A. I don't recall what the figures are.

Q. As a matter of fact, most meters are placed in a temperature warmer than that of the outside air, are they not? In cellars of houses and hallways of apartment houses?

Mr. MATHEWSON: Doesn't that depend on the season of the year?

Mr. KIRBY: Yes, very much so; warmer in winter, cooler in summer.

6029 A. I think their usual places may or may not; they are certainly apt to be warmer than the outside air, but not necessarily as warm as the remainder of the house.

Q. And we endeavor to keep our houses here at about 70 degrees, don't we?

A. That depends on whether you are an Englishman, an American, a mixture or a countryman, or have been brought up in the city.

Q. Except in the room where this hearing takes place?

A. I think sixty-five is more agreeable than seventy, personally.

Q. Sixth. "Whether results are figured on the make, corrected or uncorrected, or on the scale?"

A. If you make it "sales" it will be better. Of course, those sales also would be qualified as to whether the meters were cared for by the gas company or whether they were neglected. If they were neglected that would be apt to be to the benefit of the consumer.

Q. Seventh. "Percentage of unaccounted-for gas" is a corollary following from 5th and 6th, is it not?

A. Yes; they would have some effect, one with each other; but on the other hand the actual condition of the system might have some effect when you based it on the actual cost of oil for what you obtained so many thousand feet of sales, the per cent. unaccounted for would be possibly considered. That is the reason I probably put that in there.

Q. Going to No. 9: The gravity of oil has a bearing which depends somewhat on the atmospheric temperature, in other words, upon whether the oil which is used produces a fixed gas at all normal temperatures and pressures met with in the given locality. Will you kindly explain that a little more fully?

A. Well, simply in this way. Down in Georgia I should
6030 think that you would be apt to use a very much heavier oil, one that had a larger percentage of vapors in the gas than you would if you were in the latitude of New York City.

Q. And for what reason?

A. Well, it is a very complicated question to my mind.

Q. You do not mean my question? You mean your answer?

A. No, I do not mean my answer. I mean your question involves a complicated proposition. My view of gas is that it has various gases, vapors, from hydro-carbon products, some of the constituents of which may be of gas at a certain temperature and which, when you get into a lower temperature, may be deposited from two causes, either that they naturally go to a fluid state at a lower temperature, or the gas may contain many vapors that when the temperature is lowered they drop out as in liquid form, the same way as in the atmosphere when you get a certain condensation of aqueous vapor you drop out the rain in the lower temperature of the atmosphere. I am not prepared to state definitely what the causes of the phenomenon may be. I don't know any more than I know what electricity is, possibly.

Q. It simply comes to this, does it not, that you believe that in a place where the mean temperature is higher than some other place where the mean temperature is lower, that you can use an oil of lower specific gravity, that is, a heavier oil?

A. As we should meet it in the gas business, yes; and to make it specific the products from that oil, whatever they may be, in the higher temperatures may be vapors that can be carried by the gas and burned, whereas in a lower temperature they would be apt to be deposited in the pipes and be pumped from the drips as liquid hydrocarbon.

6031 Q. Now, of course, this has nothing to do with the actual make of the gas. The temperature in the, say Lowe, water gas apparatus, or in the apparatus of whatever name it may be, is the same, whether it is made in Georgia or Montreal is it not?

A. I would rather have you specify what the name of the other apparatus is.

Q. I mean comparing Lowe with Lowe, or Jones with Jones, or whatever the other names may be, size for size?

A. I think in general we will assume the same apparatus. Of course, I would not like you to assume the retort process and the cupola process. I am giving you a general proposition. When you come to consider the results obtained by this oil that you are choosing, as to whether it is gas made from the cupola process or made from the retort process, I think other conditions arise which I should have to make as my fourteenth proposition, perhaps.

Q. Then, assuming it was made with no particular apparatus, we get our gas to the meter where you would have the readings corrected to a temperature of 60 degrees and then into the holder, and then out through the mains, through the service mains to the service, to the consumer. It is, in your opinion, by reason of the low temperature in this northern climate that an oil which would be proper to be used in the South would not be advisable to be used in the North; that is, something happens to the gas after it comes from the manufacturing apparatus; am I right in that?

A. In a general way.

Q. Can you, in a general way, tell me what does happen?

A. No, I can't tell you what happens to the gas in pipes. I can only tell you by my personal experience what my judgment is. I cannot tell you what happens. I never saw gas except when it was hot, in the gas machine; we never see it from the time we make it until we burn it.

6032 Q. Will you tell me what your personal experience and judgment is?

A. It is that a low gravity oil will not produce a stable product under a given temperature and pressure that a higher gravity oil will within certain limits.

Q. What leads you to that conclusion?

A. My experience up to date, Mr. Kirby.

Q. What have you noticed which has given the experience of which you speak? Is it such loss in candle power which you referred to yesterday, or anything else in addition to that, and if so, what?

A. I cannot specify particularly except my general knowledge and general experience, accumulations of past years.

Mr. Mathewson: Isn't that the summary of the whole thing? The estimate is that the candle power drops where the low gravity oil is used more easily and more quickly in low temperatures than where the high gravity oil is used.

Mr. **Kirby**: I ask whether he can give me any reasons other than those he has already mentioned.

The **Master**: He has answered, and says that his general experience is all he can go by.

Mr. **Kirby**: I now have his answer.

The **Witness**: I understand he wanted to know how I reached this conclusion. I have given him an answer from information gleaned from time to time, not by one specific instance or necessarily a series of specific instances. It is an accumulation of experience and knowledge that leads me to that conclusion.

Q. You are familiar with the Pintsch system of making illuminating gas?

A. I know what it is, yes.

6033 Q. This gas is generally used in railway lighting, I believe?

A. Its principal use in this country, so far as I know it.

Q. And as such it is subjected to rather low temperatures, is it not, in the winter time?

A. In the trains, probably.

Q. Have you ever made any experiments on loss of candle power in this gas to such temperature changes?

A. Mr. Kirby—not answering your question, but you have not stated that it was also under a pressure of several atmospheres——

Q. Quite true.

A. But I have made no such experiments personally, no.

Q. Now, the tenth factor which you state is as follows:

"A gravity oil which is obtained by very heavy tar products mixed with light gasoline products must give different results from a homeogeneous oil which consists of constituents that by their closer relationship by gravity are perhaps more easily heated or acted upon more similarly by the same temperatures, such temperatures as are met with in gas manufacture."

Will you explain to me what you mean by a "gravity oil" obtained by very heavy tar products mixed with light gasoline products"?

A. I referred to a mixture of the later products in the still with those of the earliest products in the still.

Q. And such oil if fractionated would show what?

A. I don't know what it would show if fractionated.

Q. If you had an oil of that character or an oil which you desired to find out whether it was of that character, to what test would you subject it for the purpose?

6034 A. I don't know as I am sufficiently familiar with such an oil to say just what the results would be. I only referred to the mere question of the higher and lower results of distillation from the fact that if you had a very high gravity product and put that through the gas machine, and you found that certain heats in the generator would handle it best by practice, and you took the other part of that product and put it in the gas machine you would probably find that different heats were required to handle that. Now, then, take those two products and put them in the gas machine simultaneously. I think you would have such extremes that you would not get satisfactory results out of the product; that is all I meant by that statement.

Q. Have *you* any of the oils which you have made mention of as those used by the various companies, been of a character that you have just referred to, that is an oil which is obtained by very heavy tar products mixed with light gasoline products, or don't you know?

A. Well, I understood that those that have no gravity mentioned are liable to that situation; whether they are in that situation, I don't know, but in one case I understand that they discovered there was considerable of the very heavy material.

Q. How was that discovery made?

A. Well, I don't know definitely how the discovery was made.

Q. Was an analysis made of the oil?

A. I will not say as to that.

Q. If an analysis had been made of the oil, you are not able to state wherein such analysis would differ from that made of what you call homogeneous oil?

A. Well, I think you would find possibly something like this, you would probably find two products, one possibly of all gasolene and the other all very heavy gravity oil; that is what I would expect to find.

6035 Q. Gasolene?

A. Is of very light gravity.

Q. Gasolene is more expensive than gas oil, is it not?

A. Yes.

Q. Than the heavier products of the distillation, is it not?

A. Than the heavier products?

Q. Yes.

A. Yes, I so understand. I have had my principal information from your own witnesses in that regard.

Q. You have no reason to doubt it, have you?

A. No.

Q. Just what do you mean by homogen-ous oil?

A. Well, a homogeneous oil is of the nature of one the opposite to what I have mentioned, that is to say, it is the result of distillation.

Q. One which when fractionated would show a very small range of gravities?

A. I cannot say in various oils exactly what the range would be, but relatively very much different from the very highest gravities and very lowest gravities; I cannot give you the extremes.

Q. But one which was confined, say, if we made ten fractionations and found that such showed a range of over five degrees, Beaume gravity, and one which for the same number of fractionations showed a range of over ten degrees, you would consider the first one more homogeneous than the second, would you not?

A. No, I don't know that I would. I should think they might be equally homogeneous, the two oils. The mere question of having in the distillation—take any gravity, say, forty gravity, you might have forty-two or forty-four gravity, mixed with thirty-six, and they may be both straight run homogeneous oils, and might average forty gravity.

Q. Supposing we had one averaging forty gravity, and we had

forty-two, forty-four, forty-six, forty-eight and thirty-eight,
6036 thirty-six, thirty-four and thirty-two, would that be?

A. Those are not very wide ranges.

Q. Would that be as homogeneous an oil as the first one you referred to?

A. Well, that perhaps might differ with the various oils; I don't know what the upper or lower limits might be.

Q. Then a wide range to you would have but little to do with the homogeneous character of the oil?

A. Yes, but I think the very low range might have some of these very heavy products in possibly.

Q. Then it comes down to whether or not the oil contains these heavier products of which you speak?

A. Well, more or less, and what the gravity would be of the heavier products.

Q. And these heavier products——

A. I am referring now, of course—it would depend somewhat upon what the gravity of oil is; of course, if you have a low gravity oil, you have more of those products, but if you have a lighter oil you have less.

Q. Where do you consider the heavier products commence as regards to degrees, Beaume test?

A. I am not prepared to say.

Q. Twenty-four degrees?

A. I am not prepared to state at the moment. I have not it in mind.

Q. These heavy tar products you consider are deleterious in a gas oil?

A. That they are in a gas oil.

Q. Yes.

A. The products that are not gassified in the gas generator, I doubt very much if they are present to any extent in the ordinary lighter grade gas oil.

Q. And should not be?

A. Well, preferably not. I should think.

Q. Do these heavy products indicate themselves in any way in the manufacture of gas, other than in the candle-power of the gas produced?

A. Yes, I think they would be apt to indicate themselves in the distribution system and in the gas meters.

Q. In what way?

A. Condensation.

6037 Q. Condensation which would be what?

A. Hydro-carbons; I don't know what they would be.

Q. Tar?

A. Various hydro-carbons.

Q. That which is commonly called tar, oil tar?

A. I don't know—well, what is usually called drip oil.

Q. If there were a large proportion of this drip oil in the form of precipitated hydro-carbon, you would consider that the oil you were using was not proper for the purpose?

A. Or not proper apparatus, perhaps, to handle it.

Q. It might be one or might be the other or might be both?

A. Possibly.

Q. Now, the reason that 73-degree Able oil is not sold in this State is because the laws of New York require a test higher than that which 73-degree Able oil can stand?

A. That is my understanding. I believe the laws are not so severe over on the other side.

Mr. MATHEWSON: It may not be the only reason that it is not sold here; it may be a matter of price, because they sell it cheaper abroad than they sell it here, according to Mr. Emery.

The WITNESS: As a matter of fact, you know, Mr. Kirby, gasolene is sold under certain conditions, but as I understand it, 73 Able is sold for illuminating, in lamps.

Q. The statutes of the State of New York in regard to the use of illuminants in lamps or for such purposes are such that the fire test to which the oil is to be subjected is higher than that which 73 Able oil will stand?

A. I understand that is so, but I have not got the exact figures.

Q. And it is your information, is it not, that the requirements of the foreign market for the use of oil for such purposes are not as stringent as those of this country, especially New York? 6038

A. That is my one understanding. I am not stating it as a definite fact; it is my belief, however.

Q. Did I understand you to state in reference to your contract with the Standard Oil Company that you would have had to pay a higher price if your contract did not contain a clause that all of your oil would be taken from the Standard Oil?

A. I have always understood that with the Standard Oil Company that their contracts are based on all the product; I am not acquainted with any other contract with the Standard except on that basis.

Q. So if you had taken part of your oil from the Standard, you consider you would have to pay a higher price therefor than if you had taken all?

A. Yes, with other disadvantages.

Q. I take it that if you had offered to you for gas making purposes two oils, one of 34 degrees and the other of 44½ degrees, you would prefer the 44½ degrees, wouldn't you?

A. At the same price?

Q. Yes, at the same price?

A. Under New York conditions?

Q. Under New York conditions?

A. At the same time of the year?

Q. At the same time of the year?

A. Possibly; may be yes, and may be no.

Q. What is the specific gravity of the naphtha which you use?

A. I do not think any naphtha has been used since I have been here.

Q. It was formerly considered that naphtha was desirable if not absolutely necessary to make a high candle power gas, was it not?

A. Well, that depends upon the apparatus you are using. I cannot answer that yes, nor can I answer it no.

Q. To do away with use of naphtha, an apparatus has been designed so as to use a lower gravity oil, has there not?

A. No, that was not the reason for it.

6039 Q. But by change of design of the apparatus it becomes possible to use a lower gravity oil than naphtha with a relatively better result?

A. Some apparatus may improve the result with low gravity oil and other apparatus do not have to be changed if you use naphtha or other oils.

Q. Which apparatus do you use?

A. The cupola superheater type, reversed steam.

Q. Is this kind of apparatus one in which you can use naphtha and low gravity oil with equal advantage or is it one which gives better results with the low gravity oil or naphtha?

A. I think that it is a piece of apparatus that you can generally get better results from any kind of oil than any other apparatus except possibly the high gravity naphtha of ten or fifteen years ago; in that case you may get equal results probably if not better with some other apparatus.

Q. What was the character of the apparatus in 1902?

A. Where.

Q. At the 21st Street plant?

A. Retort process, and some Lowe machines.

Q. Were the Lowe machines different in any way from those in use now?

A. They are in use now.

Q. The same identical machines?

A. Yes.

Q. Any additions there?

A. Yes.

Q. The same kind and character of machine?

A. The same character but not the same dimension machine.

Q. Larger?

A. Smaller.

Q. Just as efficient?

A. Well, I think a smaller generator is more easily cleaned than a larger one; to that extent, possibly, a small machine may be better in the long run, with repairs and from other considerations. The primary difference, Mr. Kirby, the one is twelve foot and the other is thirteen. There is one foot difference in the generators.

6040 Q. But this difference in size would produce no difference in the relative efficiency of the two sizes, would it?

A. I have not analyzed the oil results on the two sizes carefully enough to state that as an absolute statement, which I would rather make here.

Q. In 1902 some naphtha was used in the 21st Street station, was it not?

A. Apparently, yes.

Q. Do you know the gravity of this naphtha?

A. I do not recall it, no. I don't know whether it is on the records or not, but if it is on the records and I saw it, I don't recall it.

Q. Well, you are not prepared to state that if you had your choice of two oils, each of the same price, one of 44 and — other of 34 degrees that you would take the 44 degrees in preference to the 34?

A. You have not qualified your question sufficiently for me to answer the question, so I am not prepared to state.

Q. Under the identical conditions as to delivery—if you had two contracts offered you, one such as you have at the present time, mentioning 28 degree and 34 degree oil, and another one similar, only with the substitution of 38 degree and 44 degree instead of 28 and 34 degree?

A. You have not got enough elements in it.

Q. Each offered by the Standard Oil Company?

A. I am much obliged to you for that, but you would have to qualify it further.

Q. You do not think that is sufficient for an answer in that form?

A. No, sir.

Q. And to be used for the same purposes as that to which you put the 28 and 34 degree oil, which you now obtain?

A. If you will add the question of average temperature or minimum temperature, etc., I will try to answer you.

Q. Well, used here in the City of New York by your com-
6041 pany. I don't think I can go any further than to say con-
ditions absolutely the same in all respects?

A. I will not give you a definite and absolute answer to that, specifically as to the use of one or the other. My judgment is that the 44 gravity oil would probably give better results during the winter months than the 34 degree, and the 34 gravity oil, or even lower would give substantially good results in the summer time. That is the best I can answer your question. At the same price, as between 34 and 44 degrees it would be hard for me to choose, in the summer time. In the winter time I think the 44 degree would possibly be better. I want to qualify it further. The question of danger of handling oil might be an element in the choice, as to danger from accidental ignition in the tank.

Q. Upon whom is the risk of handling under your present contract?

A. After we receive the oil the risk is on us; before we receive the oil the risk is on the contractor.

Q. You have stored naphtha upon your plants, have you not?

A. We have underground tanks principally.

Q. Have you ever had any fires therefrom?

A. Yes, sir, very serious.

Q. In New York City?

A. Yes, sir, in New York City.

Q. How recently?

A. A number of years ago.

Q. Do you know where?

Mr. Mathewson: We have not had any since perhaps 1902, Mr. Kirby, and could not have had any.

The Witness: I cannot give you the date; it was before the time I was here.

Q. It is more than ten years ago, is it not?

A. I cannot say more than ten years ago; I should say 6042 it was probably ten years ago, but I do not know definitely. It occurred at the 44th Street works.

Q. Now, you have spoken of the deterring influences which you consider unsurmountable in your getting oil from smaller companies, and have stated you would have to skirmish around the country in an endeavor so to do?

A. I did not say skirmish around the country.

Mr. Burr: Mr. Mathewson stated that in his question.

The Witness: Mr. Mathewson asked me that question.

Q. Well, it has been so hard to distinguish between the questions and answers that I may have been misled. I suppose such skirmishing around would cost money?

A. I think if we had to go around we would have had to have buyers out, and facilities to take the oil we bought in those small quantities, and try to ship it to New York. It would be quite an undertaking.

Q. And quite an expense.

A. Yes, it would be quite an expense.

Q. Let us come to this fleet of boats and the tanks and so forth in which to store your oil, if you made deliveries of such oil on your own account rather than had the Standard Oil Company do it. Can you give me in a little more detail than you have such estimate?

A. I would be very glad to answer any question you may wish to put to me on that subject.

Q. Well, you have the details all worked out, haven't you?

A. I have my rough notes of the details, yes, sir.

Q. Well, inasmuch as you cannot give us the information without questions as to each branch of it, we will have to take it up a 6043 little longer than we might do otherwise. How many barges did you consider would be necessary?

A. That depends somewhat on whether the storage is in Jersey or in Manhattan.

Q. We will assume, first, the storage in Jersey, and then the storage in Manhattan. First give the number for the Jersey storage, and then the number for the Manhattan storage?

A. Probably five in one case and ten in the other.

Q. Five where the storage was in Jersey?

A. Five in Manhattan and ten in Jersey.

Q. And how large would each barge be?

A. Not exceeding 200,000 gallons.

Q. Is that the size which the Standard Oil Company uses in making deliveries to you?

A. No, I think they use various sized barges.

Q. Do you know whether they have any barge of that size?

A. Yes, they have barges running larger than that; they also have some smaller.

Q. They use barges of larger capacity than this in making delivery to your works, don't they?

A. Some of them, yes, sir.

Q. Do you know how many barges they have detailed for the purpose of supplying your plants?

A. No.

Q. Is it as many as five?

A. I think—how many they have?

Q. Yes?

A. No, I cannot tell you how many they have; they have various ones; we get one barge and then we get another, and then another; I don't know what business they are in other than our own.

Q. Was it upon the number of barges which the Standard Oil needed for your purpose that you based your estimate, or was it, upon other information which you had?

A. I based it on my own judgment to a great extent.

6044 Q. You have never had any experience in transporting goods by water, have you?

A. Yes, I have had some experience.

Q. What experience have you had?

A. I have transported water-gas tar by water.

Q. Where and when?

A. Some few cargoes in Boston from one works to the other.

Q. Other than that though, you have had no experience, have you?

A. In transporting on water? I have been on the water a great deal and had a good deal of experience in boats and their management, etc., quite a little.

Q. Yes, we can imagine what such experience has been.

A. I have been in command of a vessel in New York harbor and have had some experience.

Q. How many tugs did you think would be needed for this purpose?

A. Three in one case, probably, and five in the other, the smaller number of tugs can go with the smaller number of barges.

Q. Did you estimate that this fleet would be large enough to also take care of the oil to be furnished to the other companies on the island of Manhattan?

A. I figured on 100,000,000 gallons, which would include those, but reduced to cents per gallon, which would, therefore, only involve each one independently of the other; that is to say, it would be the average price per gallon and they would all get the benefit of the increased quantity naturally; that is as far as transportation is concerned.

Q. Did you figure out the cost of these barges yourself?

A. Yes, I figured out my estimate of the value of the barges.

Q. Did you obtain bids for the same?

A. I did not obtain formal bids, no.

Q. Did you obtain information from shipbuilders as to the cost of building, or did you figure it out yourself?

A. I got information from two sources of the probable cost of barges such as I figured.

6045 Q. Shipbuilders?

A. Yes.

Q. How great a storage capacity did you give?

A. Three months.

Q. And for what degree of oil?

A. Either, the same storage capacity would do for either.

Q. Yes, one would be larger than the other, would it not?

A. No.

Q. You would not use the same number of gallons of 34 degree as you would of 28, would you?

A. I would not store it that way; I would have three months' supply on hand for the maximum day's consumption irrespective of the degree of oil; that would not influence me one way or the other.

Q. But either Mr. Mathewson in his question, or you in your answer, inferred that a higher degree oil would necessitate less storage capacity, as you had to use less of it for the purpose?

A. Well, that would not be measurable in this calculation.

Q. Then that really is not an important element which enters into consideration of the relative merits of the 34 and 28 degree oil?

A. The variations in the sales might readily compensate for any difference in oil. I merely took the amount of oil used in a given three months; as a matter of fact I do not recall what gravity it was at the time, but that would not influence me particularly. A tank more or less would not be of material difference.

Q. Nor would that be so if you used naphtha instead of gas oil?

A. No, I don't think that would be an element worthy of consideration, except so far as naphtha is concerned, of course, the danger of storage when naphtha is concerned is greater than in the lower gravities.

Q. There is no reason why gas oil should not be stored in the Island of Manhattan, is there, so far as fire is concerned?

6046 A. In small quantities, in reasonable quantities. I should be very sorry if it were considered an improper thing to store it, because it is an essential thing for us to store it. But in very large quantities, such as three months' supply I certainly would not recommend the company to do it.

By Mr. MATHEWSON:

Q. Did your estimate as you have given it, include the additional precautions, etc.,which would be required for naphtha if you were storing naphtha?

A. As a matter of fact it would make no difference to me in the precautions I would take in handling either, but I think the risk would be greater than with the other; I would take the same precautions in either case.

By Mr. KIRBY:

Q. If gas oil as a matter of fact is thrown upon a fire produced by the burning of wood, say, it would put it out, would it not?

A. I never tried it. I never would like to. I never fool with oil in such a way. I suppose it depends upon the quantity of oil and the size of the fire, you might have 100,000 gallons of oil and drop it upon a small fire and put it out.

Mr. **Mathewson**: So with gas running out of a burner tip, it will put out a match for the moment.

The **Witness**: Yes.

Q. Do you know what the flashing point of gas oil is?

A. Yes, I think it is less than 120—pardon me, no, I am thinking of something else. Somewhere around 140 and 150, 34-degree oil is. I don't know what 28 degree is. That is my impression.

Q. I think it is about 200, is it not?

A. I think I have the exact figures somewhere, but I am depending upon memory.

6047 By Mr. **Mathewson**:

Q. Does it not depend upon the character of the 34-degree oil to some extent? Will all 34-degree oil flash at the same point?

A. No, I don't think it would necessarily. It depends upon where the oil is obtained, I should think.

By Mr. **Kirby**:

Q. You have never made any experiments?

A. I personally, no.

Q. And there never has been any made by those in the employ of the Consolidated Gas Company?

A. I made the inquiry in regard to the flashing point of our 34 gravity oil at the time I was investigating the flashing point of 73 Able, and may impression is it was something between 140 and 150, the oil that we are using at the present time, that is my impression, as against 112 for the 73 Able.

Q. In the tanks which you would erect for the storage capacity of this oil did you figure in the cost of land upon which they would be situated?

A. I did.

Q. You did not consider that the Consolidated Gas Company had any land to-day which might be used for that purpose?

A. No. If such land was utilized I figured the value of the land at present that we have, I figured it on the basis of our present land, not on the purchase of any land or the price we would have to pay, but on the basis of the value of our present land. Whether we would have any piece of land to use, I don't think we would have any to use in that direction.

Q. Have you investigated the sale of residuals and the prices obtained therefor elsewhere than those sold by the Consolidated Gas Company for the purpose of making a comparison with the prices obtained by you?

6048 Mr. **Mathewson**: You mean elsewhere than in New York City.

Mr. **Kirby**: Either in New York City or out of it.

A. I have made comparisons with Boston and Boston experience.

Q. From such investigations as you have made do you consider the result of the Barrett contract for your coal tar and am-oniacal liquor a good one for the company?

A. At the time in which I considered it, as I recall, it resulted in higher returns than we would have obtained in Boston, and it was more advantageous to the company than the Boston situation.

Q. I note in Field's Analysis of Accounts, etc., for 1905, that the London gas companies obtained an average of 48 cents per ton of coal for ammonia. Do you consider that a better or worse result than the Consolidated Company obtained?

Mr. MATHEWSON: Is that very important, Mr. Master, what they got in London? It does not seem to me that that touches us very closely.

The MASTER: Well, I will let him go into the question of what they get in London, but it seems to me that particular question asked of the witness is not of very great value. If the London price appears to be more than the New York price, the question as to whether he considers it better or worse is not of very great importance, is it?

Mr. KIRBY: Well, I presume that is a conclusion, and rather an obvious one.

The MASTER: You can ask him if he knows whether they got that price in London and whether that affects his opinion as
6049 to the advantageousness or reasonableness of his contract here.

Q. Have you any reason to doubt the statement which I make, first in regard to tar, that the Gas Light Company, Commercial Company and South Metropolitan Company obtain an average of 1.37 pence for their tar and 2.09 pence for their ammoniacal liquor and sulphate of ammonia per thousand cubic feet of gas sold? You have no reason to doubt that statement, have you? If so, I hand you Field's Analysis and show you the figures therein (handing book).

A. I am perfectly willing to take your statement, if those are the figures. I don't know whether they are or are not, of course. That is about 2.74 cents and 4.18 cents per thousand.

Q. Yes.

A. But that would not modify my opinion; no, sir.

Q. That tar is not per thousand, that is per gallon.

A. You said per thousand.

Q. The ammoniacal liquor and sulphate of ammonia is per thousand, and the coal tar is per gallon.

A. I first understood the tar was per gallon, and then afterwards that you said per thousand.

Mr. MATHEWSON: Look at the book.

Mr. KIRBY: Yes, I thought I had expressed it as it is stated here. Put the question in this way.

Q. The London Metropolitan companies, as set down in Field's Analysis of Accounts, for the year 1905, received an average of 1.37 pence per gallon for tar and an average of 2.09 pence for ammoniacal liquor and sulphate of ammonia per thousand cubic feet of gas sold.

A. That seems to be correct.

Q. And your answer is that that fact does not, in any way, change your opinion?

6050 A. I think the situation in London and the situation in New York are not such that I can compare them as to results. I am already on record in that same direction.

Mr. Mathewson: And I suppose you understand, Mr. Kirby, that when you speak of gallons in Field's Analysis, you mean an Imperial gallon, which is 20 per cent. larger than the American gallon.

Mr. Kirby: I think we have threshed that out to the end.

Mr. Mathewson: There is nothing to thresh out.

Mr. Kirby: That point was taken up with Professor Bemis, or someone in your cross-examination, as to the amount per gallon, and it has been spoken of in previous testimony in this case as to the statement in Field's analysis.

Mr. Mathewson: Yes, I am simply calling attention that that gallon is different, and no comparison is correct unless that is taken into account.

Q. Coke contains about the same amount of carbon as anthracite coal, doesn't it?

A. No, I think not.

Q. How much less?

A. There is more ash in coke than there is in anthracite coal, as I recall it.

Q. Any appreciable amount?

A. Well, that is pretty hard—I am not a walking text book, I should say 4 or 5 per cent. difference.

Q. But you think that is true with domestic anthracite, I mean by that, the free burning coal, and not the hard Lehigh, which might be used for other than domestic purposes?

A. I think the free burning Lackawanna coals are apt to have more ash in them than the harder coals. Perhaps the harder coals might have more slate in them, but my impression is there
6051 is several per cent. difference in the amount of ash in coke in even these free burning anthracite coals. I should not like to make a statement to that effect unless I could consult reference books or notes on it. That is simply an impression.

Q. Mr. Doane has stated that coke is a freer burning coal than anthracite coal, it is more easily ignited and requires less draft. Is not the requiring of a less draft a positive advantage in that a less percentage of heat goes up the chimney?

A. Well, that is draught for any particular fuel. If you took a fuel that burns twenty-four pounds of air to the pound of fuel, of course, you can get a certain maximum flame temperature in your boiler, and if you burn it with twelve pounds you will get a very much higher maximum temperature and more efficiency in your boiler. I am using those figures from memory. I think the twenty-four is about practice and the twelve is about theory, and the maximum in the furnace would be about 800 degrees difference, all this is from memory, I have not looked it up for ten years. So that the less amount of air you use for a given fuel, the more economical results you will get from that fuel, but simply because a certain fuel requires less air than some other fuel you would not say there was any question of economy there. I should say there was the same saving in economy by not using twice as much air on the second fuel as against the theoretical quantity. The principal objection to my mind in a free-burning coke would be such a free-burning coke that the ordinary leaks around the doors would give more air than required. That is the only thing I can think of.

Q. Do you know whether the Barrett Company and National Coal & Coke Company market the by-products of the Central Union Gas Company?

A. What is that?

6052 Q. Do you know whether the Barrett Company, with whom you have your contract for coal tar and ammoniacal liquor, also purchases the coal tar and ammoniacal liquor or sulphate of ammonia from the Central Union Gas Company?

A. The first question included another company?

Q. Yes, and I separated them so you may have less difficulty in answering them.

A. My impression is that the Barrett Company buys the by-products from the Central Union.

Q. Do you know whether the National Coal & Coke Company market the coke of the Central Union Gas Company?

A. I don't recall what that company is—

Mr. Mathewson: Mr. Doane testified that the National Coal & Coke Company sold nothing but the coke of the Consolidated Gas Company.

The Witness: Oh, I was confusing in that question the United Coal & Coke Company, which erects our Hoffman ovens.

Q. No.

A. You mean our National Coal & Coke Company?

Q. Yes.

A. No, they do not handle Central Union coke.

Q. You have spoken of the recent increase of wage being ten per cent. to all those receiving less than two thousand dollars a year. Will you point out to me under Exhibit 94 under what item this increase would be shown?

A. I cannot identify properly every item, but I would name a number that I believe would appear. Under the head of coal I should expect it to appear in cartage and labor handling——

Q. Would the entire $225,000 a year be distributed over those items?

6053 A. Pardon me, I was commencing to give them to you. Do you want to cut me off with th- two items?

Q. I do not. I beg your pardon. I thought you had finished.

A. In residuals it would appear in all three of those items, probably.

Mr. Mathewson: You mean all three of the items under the head of residuals?

The Witness: Yes—no, it might not appear under the one, coke loads, as that does not include any handling of the loads of coke.

That is net coke. I am not positive but that there might be some item of labor under the heading tar and the four items that follow under residuals. Under the head of coke used, tons, the labor and cartage would be affected; cartage and labor under the heading beginning naphtha; and in the fuel oil which includes drip oil, labor, that would be affected; in the repairs to apparatus, buildings, tools and implements, in so far as labor is involved; in expense; in distribution; in experiments; in distribution, station expense; in cost of manufacture under agency agreement, in so far as the labor would affect other companies; following on down in expense, and in all the items appearing there excepting street lamps, interest on consumers' deposits and bad and doubtful debts; profit and loss adjustment; expense to the general office; vacation and sickness; automobiles, if any item of labor appears in there; I do not recall for the moment. Those are some of the items.

By Mr. Mathewson:

Q. Would it not appear in the item, ten cents for renewals and contingencies as that ten cents includes replacements?

6054 A. It would appear in the contingencies so far as contingencies are concerned, not only the amount I gave heretofore, but the additional amount at this time, amounting to the full amount, upwards of $180,000. What I would like to specifically except is that it would not include any labor that was used in the direction of improvements other than replacements, but they do not appear on Exhibit 94.

By Mr. Kirby:

Q. In crediting to the cost of producing gas at your different stations, the amount obtained for your residuals, you have used, I take it, the amount paid to you by the Barrett Manufacturing Company, or the other concerns to which you sell your residuals, or to yourself, where you use them yourself, and make a credit therefor, and reduced it to a cost per thousand cubic feet of gas made and sold, have you not?

A. Mr. Carter can better testify to specific details of that kind, Mr. Kirby, than I can, but I will testify as well as I may on the subject in that direction.

Q. If Mr. Carter is better informed I would much rather leave that examination to him.

A. He handles the books, but the tar is charged to us, a certain amount. I am uncertain to one item, particularly, and that is as to the tar we burn, how that is charged.

Mr. Kirby: I would much prefer, if Mr. Carter has a better knowledge of the subject, to examine him, but by reason of the testimony which has been put in as to the price obtained as to these residuals, there are some few questions as to how the amount is produced.

The Master: Mr. Mathewson has said that he would produce Mr. Carter here.

Mr. Mathewson: Yes, and will ask him as to the residuals.

6055 Mr. Kirby: I do not want, then, to take up any further time of Mr. Addicks on that subject.

At 1 P. M. a recess was taken until 2:30 P. M.

After Recess.

Walter R. Addicks resumes the stand and further testifies:

Cross-examination by Mr. Kirby (continued):

Q. Just one more question in reference to depreciation, if I may. What would you consider a fair depreciation on a piece of apparatus costing $2,100 which every three years requires repairs to the extent of $450?

A. Every three years requires them?

Q. Yes.

Mr. Mathewson: When? When first put in?

A. You do not care to specify the apparatus, of course?

Q. No.

A. You do not apply it to the gas company either?

Q. No, not necessarily.

A. Given a mere proposition, irrespective of where it is being used, how it is being used, what maintenance is ordinarily put on it, if you have a piece of apparatus costing $2,100 and assuming that the $450 is put upon the apparatus in every year, assuming there is no suspense accounts, I should say that the depreciation would be—assuming also that the wear and tear is gradual, that the depreciation would be—the original value would be $2,100, and one-
6056 third of $450 the first year, two-thirds of $450 the second year, and as the third year the repairs would be made it would bring it back to $2,100 again.

Q. What has the suspense account to do with depreciation?

A. Well, I mean by suspense account in that sense that you are not providing for repairs on that apparatus each successive year in anticipation of the final. That is what I am referring to.

Q. Well, assume that when we got to the third year we would have had to expend upon it $450 and would set that proportion aside each year, would that have anything to do with the depreciation on the apparatus itself?

A. The third year you would not have to obtain from your earnings your full $450, but you would have spread it in repairs during the three years.

Q. It simply has reference to the source from which you take the money to make the repairs with?

A. Yes, as to whether one year or three years.

Q. Taking up your testimony of yesterday (page 5925) you state in reference to the oil gas at 21st Street—or, rather, Mr. Mathewson stated—in other words, this 400,004 includes the oil made at 21st Street and which is sent to the 14th Street station, as well as the gas actually made at the 21st Street station and sent from here, does it no?

A. Yes. It includes oil gas.

Q. You are quite positive that the deduction from 400,004 to 384,604 is not due to correction for temperature?

A. I have not got my original because the stenographer has not returned it to me.

Mr. MATHEWSON: It is 384,604.

Q. I refer to page 5930 of your testimony where the total of water gas made for the month of February, 1905, is given as 384,604?

A. I have to assume that that is correctly reported from the one I gave.

6057 Q. Well, assuming that is correctly reported?

A. I checked that, Mr. Kirby, as including the oil gas and not the corrected gas, and I have no reason to believe that my statement is not absolutely accurate, that that represents the gas made, including the oil gas, and is not the uncorrected; that this figure is not the corrected carburetted water gas with the corrections due to temperature excluded.

Q. That is, that 400,004 would be the total of the water gas uncorrected and the oil gas?

A. No, I do not say that the 400,004 is the water gas uncorrected, whether it is corrected or not corrected, but the 400,004 included the oil gas made for the 14th Street station, whether it was corrected or uncorrected, because this 400,004 I do not recall at the moment, but if it were the corrected or whether it is the combination of the corrected oil gas and uncorrected water gas, or corrected water gas and uncorrected oil gas, I don't know; but the figure I gave is the carburetted water gas made, corrected for temperature.

By Mr. MATHEWSON:

Q. That is 384,604?

A. Yes, sir.

By Mr. KIRBY:

Q. 384,604 for February, 1905. Very good. Now for December, 1902, have you that statement?

A. I have, yes. I have not got the corrected one.

Q. The total of the first column there being 390,777, is also only for the carburetted water gas and includes no oil gas, am I right in that?

A. Oil gas for the 14th Street station?

Q. Does it include any oil gas?

A. Well, such oil gas as would be in carburetted water gas.

Q. But outside of that not?

A. No, it is not included.

6058 Q. Now, likewise with the third column, the candle power at the station, I am right, am I not, in assuming that those candle power readings are for the carburetted water gas as enriched and it does not include any readings upon the oil gas sent down to the 14th Street station?

A. No, I should say not.

Q. That is, it is the readings on the gas which came from the Lowe apparatus?

A. No, it would probably be the readings from the Lowe plus the retort and oil process which was in use in 1902.

Mr. MATHEWSON: There were some Lowe sets there, Mr. Kirby, and some retorts at 21st Street, besides those producing the oil gas for 14th Street.

Q. The gas as tested with the tests as set down in this statement on page 5932, is that which went into the holder at the 21st Street station and was then distributed to the consumer?

A. I cannot tell you whether the test is at the inlet or the outlet of the holders.

Q. Well, either into the holder or from the holder?

A. It is the make of gas at that station, not the make of some other station added to it. It is the gas made there in that station and sent to the consumer.

Q. And it was not enriched after the time of testing before going to the consumer?

A. This would be an enriching product itself, this would not be enriched but it might enrich some other gas.

Q. Do you know whether or not this gas with the candle powers here set down was sent out to the consumer?

A. This was before I was here—1902.

Q. Well, go to the 21st Street station, February, 1905, when you were here?

6059 A. I cannot be any more particular. It is the make of the gas of the station. I do not make personal tests.

Q. But you are familiar with the tests?

A. Yes, I am familiar with the tests of the gas of every station where there is such a test.

Q. You have set down here a table on page 5934 of the testimony, giving December, 1902, and December, 1904, February, 1905, to December, 1905, giving the candle power test at the station and the candle power at the city testing station and I note that for December, 1905, that you give the candle power at the station 26.51?

A. What year is that?

Q. December, 1905.

A. Yes.

Q. Which is the same as that appearing as the average of the tests during the month of December on the table set down on page 5933 of the testimony ?

A. Yes, that is right.

Q. So that you have made comparison of the candle power with the test of gas taken at the city testing station?

A. That is right.

Q. So that am I not right in assuming that that is the same gas tested at the station and then which went to the city testing station and was there tested?

A. That is the gas which the City Inspector reported as having tested of the gas at that station. You can take his report of it.

Q. So that this gas had no further enrichment or treatment of any kind from the time it was tested at the station?

A. Well, I only know that the city inspector in his laboratory reports to us he had tests of certain gas as 21st Street gas. We have not access to his laboratory and don't know what he does in his laboratory.

Q. What do you mean by 21st Street gas?

A. Haven't you seen the different tests?

Q. Yes, but I want to know what you mean by 21st Street gas when you speak of it as such?

6060 A. That is simply the gas reported by the inspector as having tested 21st Street gas.

Q. What do you mean when you said 21st Street gas in any of these tables?

Mr. MATHEWSON: Those are Mr. Edgerton's tables. We are taking his figures. It is not our method at all.

Mr. KIRBY: This was December, 1905. Mr. Edgerton had nothing to do with that whatever.

Mr. MATHEWSON: His method was pursued in making up the figures.

A. It is simply a report of the months of 1905, the similar report for those months which Mr. Edgerton took prior to that. That is all.

Q. Where did you get these readings of candle power as set down in the third column of your statement, December, 1905?

A. From the same source Mr. Edgerton got those as set down here.

Q. Do you know where that gas is obtained to make those candle power tests with?

A. It must have been obtained only from the station where the gas is made.

Q. The gas as it goes into the holder or as it comes out?

A. If the gas is going out of the holder, if it is enriched with any other gas, it certainly would not be the candle power of the station. It would be that gas which was being made by the station.

Q. And would be so indicated upon your records, would it not?

A. Yes, the very fact of "candle power at stations" would indicate that to me.

Q. That is what I assumed and asked you, and now we know.

A. That is the fact.

Q. Now, December, 1904, I think has been referred to by Mr. Simpson as being an exceptionally cold month. Is that in 6061 accordance with your impression?

Mr. MATHEWSON: You are mistaken. Mr. Simpson did not mention any month. He said that winter or some other winter was an exceptionally cold winter taken throughout. He did not say December was exceptionally cold.

Q. Do you know whether or not December, 1904, was colder than December, 1905?

A. I know that December, 1905, was the warmest December since 1891.

Q. Then December, 1904, would naturally be a colder December than that of December, 1905, would it not?

A. Yes.

Q. And it is also your impression that the winter of 1904 and 1905 was exceptionally cold, is it not?

A. Well, I don't know whether it is 1904 that December was colder or 1903.

Q. If Mr. Simpson has so stated you would be inclined to concur in that conclusion?

A. My impression is that Mr. Simpson did not differentiate between 1903 and 1904.

Q. As a matter of fact both of those winters were cold winters?

A. 1903 and 1904?

Q. 1903 and 1904, and 1904 and 1905?

A. I can't remember whether it was 1902 and 1903 or 1903 and 1904, but it is one of those two. There were successive cold winters, but whether the coal strike year was one of the cold winters or not I cannot recall at the moment.

Q. Am I right in inferring from your testimony that you advanced the proposition that high gravity oil so enriches the gas that the gas holds its candle power better than when a low gravity oil is used?

A. I think, to put it more accurately, that the higher gravity oil gives gases and vapors which are not so apt to be condensed by a low temperature as the low gravity oil. 6062

Q. And you also advance the proposition, do you not, that where you use a high gravity oil that the loss of candle power in the mains is less in cold weather than where you use a low gravity oil?

A. I think it is apt to be. Of course, there are limits to all degrees.

Q. I call your attention to State's Exhibit HHHH, page 1585 of Exhibits, and to 21st Street station. This is for the year 1905, as the testimony of Mr. Edgerton shows? I note in December, 1905, the average gravity of oil was 34.49, candle power at the station 26.51, city inspection candle power 23.37, showing a loss in candle power between the works and the city inspectors' stations of 3.14 candles. I call your attention to January of 1905, where the gravity of oil used was 30, the corrected candle power at the works 25.14, city inspectors' test 25.24, showing a loss of 3.9 candles. Does that carry out your conclusion with reference to loss of candle power in the mains, whether a high gravity of oil is used as against a low gravity of oil?

A. Not as conclusive as in some other cases you will notice. There is a larger number of gallons of oil used in January than in December, and a larger loss of candle power in January than in December.

Q. And a lower gravity oil in January than in December of 4.49 degrees?

A. Yes.

Q. I call your attention to the reading of April, where you used a gravity of oil as high as 33.8, where the test at the station was 25.07, and by the city inspector 21.69, showing a loss of 3.38; and then in July of the same year, where we have an average gravity of oil used of 28.38, candle power at the station 27.72, city inspectors' candle

6063 power 24.61, showing a loss of 3.11 candles. Does that carry out your conclusion as to loss of candle power being greater with low gravity oil than with high?

A. The loss of candle power in the case of this higher grade oil is a little greater than in the lower, although with the lower gravity oil there were 4.83 gallons used in place of 4.49 of the higher gravity, but you are coming now into the summer weather where we use either gravities as a rule. I would like to call your attention further to 44th and 99th Streets.

Q. Yes, I would like to call your attention to any statements there which carry out your conclusions.

A. Well, I will call your attention to the fact that the losses shown as of November and December in 44th Street are very much less than the higher gravity oil, as a rule, than with the lower gravity oil.

By Mr. MATHEWSON:

Q. How about April there?

A. In April, in that case, the loss is 1.71, whereas in December here, 34, it was considerably smaller than that.

By Mr. KIRBY:

Q. December, of which you have just spoken, December, 1905, 44th Street station, I see a note that the candle-power, as tested at the station, was 24.21, while at the City Inspector's office it was 24.26 or a gain. How do you account for that?

A. Well, that occurs at times, in many stations on the same day. I would further say this, that this variation, even with 34 gravity and 29, gravity illustrates to some extent that it is preferable to use an even grade of oil during a given season and not change from one to the other, on account of the fact that the gas makers will have to accustom themselves to change of gravity. You notice in March and April and in May they went up in gravity and then went back again.

6064 By Mr. MATHEWSON:

Q. That is 21st Street?

A. That is 21st Street. And it is true of April in 44th Street, and it is more uniform throughout the year at 99th Street, although there is considerable variation in 99th Street from month to month.

By Mr. KIRBY:

Q. Again I call your attention to the fact that these readings are averages for the month, so that this gain in candle-power in December would indicate that it was not one or two isolated readings but the readings over that entire period which show a gain of .05 candles rather than an extraordinary result, is it not?

A. Well, that shows the average gain.

Q. A gain in the mains?

A. Yes. It is a little different between—that is, 44th. Well, the difference in 99th, there is a slight difference in the apparatus of 99th and 44th Streets. The same thing is true in the 99th Street station; there is a gain.

Q. In the same month?

A. Yes, sir; in the same month; December; also in November.

Q. You do not advance the proposition, do you, that gas is apt to gain in candle power from the station to a point a mile or more away?

A. No, but I would say that two observers would not be able to read candle power closer than half a candle, if on the same bar, so while there might apparently be an increase in candle power there might not be any increase at all, simply the difference between two observers—a personal error.

Q. If the error was only that of .05 candles, it would?

A. It is a pretty small difference.

Q. It would mean then there would be no loss in candle power from the station to the city testing station?

6065 A. Not necessarily that, but there might not be any loss.
You notice in 30 gravity oil here, just before, in October, that there is a loss. No, there is no loss in that case either. Quite a number here where the—— Yes, there is a loss in November, but with the high gravity oil there was no loss.

Q. Well, if these tables with their rather extraordinary results in some parts thereof show anything, do they not show a substantial agreement with Mr. Edgerton's testimony that condensation products are largely lost in the gas holder during cold weather, and that during the first warm weather of spring those products are re-evaporated, enrich the gas at the station and are again deposited in the colder mains on account of their instability?

A. I would not draw that conclusion from that, as it does not seem a material drop in the candle power in November and December to indicate a very large accumulation of oil on the top of the surface of the water. As far as any pickings of oils on the surface of the water, I am doubtful if that occurs materially. I can conceive that it might occur if there were oils in the line of main, where if the gas going through was below saturation that hydro-carbons might be picked up. I can't quite see how a material picking up the vapors in a gas holder where the gas is 150 feet high and the area is the area of a 100 or 200 foot tank, I don't quite see how it is possible for material picking up of the hydro-carbons. I never have been able to follow that as a theory.

Q. The large surface of holder exposed to the sun would produce a substantial increase in temperature of the gas contained in the holder, would it not?

A. On the portions of the holder immediately adjacent, yes; it does make a difference, quite a considerable difference, but I don't think that it extends very far down into the middle of the gas
6066 holder. It does not affect the entire body of the gas in a very
large holder. On a very small holder, such as Mr. Edgerton has probably been accustomed to, it might produce an impression, but I do not believe it does here.

Q. The larger the holder the larger the area of surface exposed?

A. That is true, but the volume would be greatly increased proportionately.

Q. The gas leaves the holder at approximately the bottom thereof, does it not?

A. The gas leaves the holder at the level of the water, wherever that may be.

Q. That is not close to the top, is it?

A. Well, it is close to the top of the inlet and outlet of the holder, and in a steel tank is level with the top of the tank, and if you have the holder fully cupped, five lifts of forty feet each, it would be about 200 feet high. The gas would come in the inlet, go into the holder and go out at the outlet pipe if coming in and out at the same time. Just how far that gas will go into the holder I don't know.

Q. The outlet pipe being about the level of the water?

A. The inlet and outlet pipes are just about far enough above the water so that when it is in use the water won't flop over into either the inlet or outlet.

Q. The precipitated globules or oil——

A. Condensed hydro-carbons.

Q. The condensed hydro-carbons would be upon the surface of the water, would they not?

A. They lay on the surface of the water, and when they get to a certain amount they are taken off.

Q. And the gas warmed by contact with the holder which, in turn, is in contact with the warm outside air or which has the rays of the sun playing upon it, would pass over this water upon which would be floating these precipitated hydro-carbons, would it not?

A. Yes. Of course, you understand they are at only one
6067 point. The gas itself is over the whole surface.

Q. Oh, yes.

A. And if that gas is not saturated with vapors, and the warmer the gas is the less saturated it might be, it might pick up a certain amount, but I am not able to subscribe to the theory that that is of appreciable moment. That is all.

Q. It would be more appreciable than it would be in buried mains where the temperature of the surrounding earth is in the spring less than the temperature of the air surrounding the holders, and where those mains are not subjected to the heating power of the sun?

A. I think it would be more noticeable in the mains, if you had mains filled with them. As a matter of fact, we do not have mains filled with them. The mains are continually pumped and, therefore, what condensation accumulates from time to time is removed as rapidly as possible.

Q. So if any candle power or hydro-carbon were picked up it would be picked up in the holder?

A. Well, I think, to a greater or lesser extent, yes.

Cross-examination by Mr. Burr:

Q. When you say, at page 5934, that the city test averaged 21.80, where did you obtain those figures?

A. What date; what time?

Q. December. Mr. Mathewson said, "Q. Now, taking 1902"——

A. December, 1902.

Q. Yes. "The gravity of the oil was highest, was it not from 36 to 38 gravity? A. Yes. Q. And the station test was how much? A. 23.89. Q. The city test averaged how much? A. 21.80." How did you arrive at that average?

A. I requested that at the office of the company and they furnished me with copies of the city's tests and the dates thereof.

6068 Q. Have you got those figures?

A. I have. This is December, 1902, we are discussing?

Q. Yes.

A. December 5, 20.57; December 12, 23.89; December 20, 22.12; December 26, 20.62; average, 21.80.

Q. Now, you have stated that you estimated the requirements for oil for the companies whose supply is derived from the contract of November 1st, 1905, to be 107,420,460 gallons for the period from 1907 to 1908.

Mr. Mathewson: For each year?

Q. Or for each year?

A. No, that is not each year. That is for that year.

Mr. Mathewson: For what year?

The Witness: For the year 1907. That is to say, twelve months, taking the twelve months, of the entire twelve months.

By Mr. Mathewson:

Q. Not for two years?

A. No, I thought you said for each year.

Q. No, that is what I mean.

A. It is for one year.

By Mr. Burr:

Q. From a period in 1907 to the same period in 1908?

A. It would cover a winter and summer and spring and autumn. If you commence at autumn you go to the autumn of the following year. Covering the winter season is what is referred to.

Q. That, you say, would be the amount?

A. That is the estimated amount probably used at that time.

Q. Upon what do you base that amount and which companies do you refer to?

A. I based—shall I tell you just how I arrived at it?

6069 Q. If you please?

A. Years of 1905, 1906, 88,770,000 gallons, and for each year increasing about 10 per cent. of the amount of oil used.

Q. Well, do you know what the 1905 figure was based on?

A. 1905? Yes, I do. Some figures of use of oil at that time for those months, simply a rough estimate to get at about how many gallons to put into a contract. We do not use our oil always within the time of the contract. We are allowed sometimes to extend over.

Q. The testimony here is, as I understand it, that the coal and oil purchased by the Consolidated Gas Company, and the contracts for which are in evidence here, such coal and such oil is used by all the constituent companies forming the Consolidated Gas Company—I mean used at all the stations of the Consolidated and by all the subsidiary companies with which the Consolidated Gas Company has contracts?

A. No, that is not true.

Q. Do you say that the fact is not true or that that is not the testimony?

A. Well, I don't know whether the testimony is to that effect or not, but if so, I don't agree with the testimony.

Mr. MATHEWSON: No, it is not. I think what Mr. Burr has in mind is that this contract of 225,000,000 gallons for convenience was negotiated in one contract and it was to cover the supply for the Consolidated and part of which the New Amsterdam was to receive and part the Standard and part the Central Union.

The WITNESS: That is correct, but there is an agency agreement between the Mutual and the Consolidated, if I remember rightly, and that does not include the Mutual.

6070 By Mr. MATHEWSON:

Q. You mean agency agreement for the purchase of gas under that agreement?

A. Yes.

By Mr. BURR:

Q. But the coal and oil which you arranged for under the contracts and which are now in evidence are used by your varaious stations and by the companies that you have agency contracts with?

A. Well, we have agency contracts with those who use it.

Q. The three companies Mr. Mathewson just named?

A. Yes, but not all we have agency agreements with.

Q. Now, what I would like to know, if you can give me the data, is how much oil is used by each station of the Consolidated, and how much by each of those three companies.

Mr. MATHEWSON: Mr. Master——

The WITNESS: I could not give you that offhand, to save my life.

Mr. MATHEWSON (continuing): You will remember this question came up in reference to this contract for oil and counsel were permitted to examine the books of the company including their oil receipts, to show just exactly how much went to the company; the same as to coal; and their accountants have been on the books for something like three months——

The MASTER: The witness says he cannot give it.

Mr. MATHEWSON: But he is asking for information that is already on the record, in any event.

6071 The WITNESS: Wait a moment. I think I can answer such a question as you need now.

Q. Please do so.

A. You ask for 1905 and 1906.

Q. Yes.

A. I can't tell you that. I haven't my estimate for 1905 and 1906. I can only give you 1904 and 1905.

Q. Well, give me that.

Mr. Mathewson: What date, begin and end?

The Witness: Beginning October 1, 1905, and ending September 30, 1905. Each station?

Q. Yes, please?

A. On account of—

14th Street	3,309,082
21st Street	19,079,656
42nd Street	2,033,608
44th Street	10,385,722
99th Street	6,190,864
Standard	11,781,978
New Amsterdam	23,236,488
Central Union	4,689,166
Total	80,706,564

I have not got the Mutual on my list.

Q. Now, when you assume ten per cent. yearly increase in oil since that time, is that based on ten per cent. of yearly increase of sales of gas or what?

A. No, simply a rough figure on the use of oil to make a contract which will certainly cover the oil we require under any circumstances. As a rule, so far as my experience goes, the oil extends over to several months afterwards.

Q. Well, has that been your experience since you came into the Consolidated, that the consumption of oil has incerased by that amount, ten per cent. each year?

A. I don't recall what it is. We simply took a round
6072 figure to get a full figure for the amount and then I deter-
mined on, I think, 250,000,000. If you add those together
it will make more than 250,000,000. It makes—the total of the figures I have here makes 292,000,000 and I took 254,000,000.

Q. So when you spoke of the requirements of oil for the companies whose supply is derived under the contract of November 1st, 1905, you had these stations and these companies, the Standard, New Amsterdam, Central Union and Mutual in mind?

A. Not the Mutual, no, sir.

Q. But with that exception, you had the stations and other companies in mind?

A. Yes, sir, because I referred to that contract which it has already been stated covered all those companies.

Q. You in your capacity as active manager of the Consolidated and vice-president and chief engineer, as I understand——

A. I am not chief engineer, Mr. Burr.

Q. Well, in your official capacity you undertook the negotiation of the oil contract?

A. Yes.

Q. And as I understand, you did the very best that you could under the circumstances as you found them to exist?

A. I made the best effort I could, yes, Mr. Burr.

Q. And you found as the result of your investigation that there was no other company beside the Standard Oil which could supply the quantity of oil which your company required?

A. I knew that, Mr. Burr, before that time.

Q. And therefore, if the Standard Oil Company saw fit to charge you 5 cents or 6 cents you would be obliged to pay it, there is no redress?

A. In the absence of not having a coal gas plant large enough to drop the use of water gas, I think that is a fair statement; that is one of the reasons I am anxious to have the coal gas plant at Astoria so we will be independent of everybody.

6073 Q. From your experience in Boston and here, the consolidation of companies is largely based upon the assumption that such consolidation will result in an economy of cost of operation.

A. Well, my view has always been that it causes an economy of construction in the future.

Q. And in the operating expenses?

A. It would tend to reduce that, but the point I have always had strongly in mind is that you can start and lay out your plant with a uniform idea; you do not have to duplicate mains. Take New York, with several companies, you might have to lay mains for two companies, whereas one main might be laid of slightly larger size to accomplish the object of both companies. The division of a company, I called attention to that in Boston, if I recall it, one company might be weak in a certain district where another company might be strong. And if mains have got to be laid independent it seems to me it is a waste of capital; and the same thing is true of works. When you come to the actual maintenance of the plant, it reduces it in the future and reduces it, to some extent, in the present, particularly in the principal officers of the company.

Q. Yes, but as I understand it, consolidation seeks to bring under one general head and one general department what formerly extended under various heads and various departments and thus save expense of the operation?

A. That is the tendency, certainly.

Q. And where small companies are obliged to pay large prices for various supplies, the aggregate of these companies, requiring a far greater quantity, would result in reduced prices, that was the idea?

A. That depends upon what you are buying, of course.

Q. That is the idea of consolidation, is it not?

6074 A. I never have considered consolidation in the sense of reduction in large quantity supplies. I have looked at it entirely from the operating standpoint, of labor and capital account. I have never looked at that point of view.

Q. From your experience you would not say that consolidation would result naturally in the increase in the price of the supplies?

A. No, but it might mean this, that you might consolidate two stations or two companies that were both buying sufficiently large quantities of a thing to get the same price; therefore consolidation would not affect economy in that direction. On the other hand, you might have a very small company and a very large company, and consolidation would reduce the cost to the smaller company but not affect the cost to the larger one.

Q. In procuring the supply of oil you found to be necessary here, why did you not open up negotiations with various companies for the supply of each particular station and each particular company that you have named, and thus open up competition?

A. It would not have occurred to me to do that, Mr. Burr.

Q. It could be done?

A. Well, I don't think it could be done; but, however, if you say so——

Q. Well, could it be done?

A. I don't think so.

Q. Why not?

A. Because I do not think you could obtain it. I have been through the experience already outside the Standard Oil Company myself. I have bought oil from outside.

Q. Do you mean to be understood as saying that with all the other independent companies in existence to whom you have made reference and the Standard Oil that by such means you could not open up competition between the Standard Oil Company and
6075 these other companies for the supply that you need at these various stations and various companies?

A. To be perfectly frank with you, I would not undertake it. I would not undertake the responsibility.

Q. But you would not be understood as saying it could not be done?

A. Well, I do not believe it can be done.

Q. What is the next largest gas company in the City of New York to the Consolidated?

A. Now, are you speaking of the Consolidated as the Consolidated *versus* the New Amsterdam, or do you mean the various affiliated companies of the Consolidated Gas Company?

Q. I mean in the City of New York.

Mr. Mathewson: In the Greater City?

Mr. Burr: In the Greater City.

The Witness: I think the Brooklyn Union would be the next largest.

Q. Do you know what kind of oil that company uses?

A. I am not in touch with what oil they are using at the present time.

Q. You are not the engineer or consulting engineer for that company?

A. No. Years ago I was consulting engineer for several of the small Brooklyn companies, but that was a good many years ago.

Q. Are you familiar with their output of gas, the quantity per annum?

A. I saw it in the course of their investigation, but I do not recall what it is; my impression is it is something like about thirty millions a day, as a maximum, but I will not be sure about it.

Q. What is the storage capacity for oil at your plants and at these companies' plants?

A. I think approximately the following:

6076 14th Street	Nothing	
42nd Street	180,000	gallons
21st Street, about	440,000	"
44th Street	306,000	"
99th Street	226,000	"

That, I think, is figured on everything chock-a-block.

Q. That is 1,146,000 gallons, is it?

A. Yes. At 21st Street we are just finishing constructing a half million gallons tank which is not ready for use.

Q. An additional storage tank for half a million gallons?

A. Yes. But I do not think that is in service yet.

Q. That would be 1,146,000 gallons storage capacity?

A. I did not add it up. I will, if you want me to.

Q. Well, you can see if it is correct. I understood you to say that some little while ago you had run out of oil almost entirely?

A. At 21st Street.

Q. At 21st Street?

A. Yes.

Q. In case of shortage at one station do you get oil from another station?

A. No, sir.

Q. Why not?

A. Well, it would be hardly possible to discharge our tanks into a barge, and bring the barge around and discharge it back.

Q. That is the only method by which you could do it?

A. That is the only way I could think of.

Q. And some few weeks ago when the defendants sought a sample of 28 Beaume, I understood you were all out of 28 Beaume oil?

A. It was during the winter and we are using 34 degrees. If you would come in the summer we would give you 28 degree.

Q. You did not have enough even to fill a bottle?

A. I so understood, yes, sir.

6077 Q. Now, on page 5940 you gave a resume of the amount of oil required by the various companies, showing, or attempting to show by comparison what a small lot it was compared with the amount that you required, and how long the oil that you needed or used in eleven days would last the various companies?

A. The oil we received in eleven days would last these companies.

Q. Received?

A. Yes.

Q. Now, if these companies were all joined together and sought to obtain the aggregate amount they needed, is it your opinion that they would meet with the same difficulties that you have met with in securing your supply for the Consolidated Gas Company?

Mr. Mathewson: I object to that as wholly hypothetical. These companies scattered around in one place and another, of course they could not be joined and could not exist under these conditions.

Mr. Burr: Well, he has indulged in a great deal of speculation.

The **Master**: It is a little remote, but I will let him answer it if you think it is of value.

A. Well, I do not care to answer that question, Mr. Burr. The stations are very widely scattered, some are in the oil regions, very far away, and some near the oil regions, and I don't know what effect it would have.

Q. Have you any knowledge or information of the supply required by the U. G. I. for their various stations and subsidiary companies?

A. No.

Q. Do you agree with the statement of Mr. Mathewson that "if we got all the oil in the country outside of the Standard Oil Company it would not be enough"?

6078 Mr. **Mathewson**: That was his statement, I did not say anything about it.

Mr. **Burr**: On page 5941: "Mr. Mathewson, we will meet that a little later in this testimony. If we got all the oil in the country outside the Standard Oil Company it would not be enough."

Mr. **Mathewson**: Well, he so testified, and I was simply echoing him.

The **Witness**: Do I agree with that statement?

Q. Yes.

A. I think I very clearly stated what I did state, that is that some sixty odd thousand gallons of 34 gravity oil would seem to be available if the yield of that grade was the same throughout all the United States and handled by all the outside refineries, which was less than would be required by this company. But as far as 44 gravity Able is concerned I stated that there was slightly more of that, and if yield averaged the amount assured them from the crude used, there would be slightly more than that amount made in the United States, and it would just be sufficient in round numbers for our probable need if we could obtain it all. I think that was my statement, Mr. Burr. But the crude oil itself, so far as the crude is concerned, is very much in excess, it is some—from my memory, over 300,000,000 gallons, when you take the whole volume of the crude, I mean.

Q. So that unless you would adopt some such means of creating competition as asking for bids for the supply of each station and each subsidiary company, you would continue to be absolutely at the mercy of the Standard Oil Company to pay whatever price they exacted from you?

A. Mr. Burr, under the condition as I see now in the case, we could not buy oil cheaper from anybody in the United States 6079 than we are buying now, on the evidence which has been put in here by these gentlemen from the west.

Q. I have no objection to your making that statement, but I will ask you to answer the question if you will, please?

A. Well, I did not intend it should not be answered. Will you repeat the question, please?

Q. So that unless you would adopt some such means of creating competition as asking for bids for the supply of each station and each subsidiary company, you would continue to be absolutely at the mercy of the Standard Oil Company to pay whatever price they exacted from you?

A. I will say this, in answer to that question, that we must depend, it would seem to me, upon the Standard Oil Company in any case for a portion of the product, and unless we could purchase from the Standard Oil Company that which we require over and above what we could purchase and store from any outside companies, we would be in the same position, it seems to me, as we are now.

Q. I will not argue the question with you. That is the best answer you make to the question, is it?

A. If you will read the question I will try again, if it is not satisfactory.

Question repeated as follows:

"Q. So that unless you would adopt some such means of creating competition as asking for bids for the supply of each station and each subsidiary company, you would continue to be absolutely at the mercy of the Standard Oil Company to pay whatever they exacted from you"?

The Master: It seems to me that is responsive, Mr. Burr.

Q. Well, I am asking if that is the best answer you can 6080 make?

A. Mr. Burr, the other companies are very large companies. The other companies may require more oil, they themselves, without the Consolidated Gas Company. They themselves may require more oil than they could buy from the independents, so called. You see, if I can make it plain, suppose you had one very small company, you might buy all the oil possible from that one company but——

Q. The point I was going to make——

A. I do not like the expression "at the mercy of" because I do not think that is exactly the situation.

Q. Unless you can devise some way of opening up competition in the way I have suggested, or some other way, you will be, as a matter of fact, obliged to deal as you are dealing, with the Standard Oil Company and in the manner which you have done?

A. Yes, I think we will have to deal with the Standard Oil Company, if that answers your question, unless some other method can be devised.

Q. You say the average cost of the oil which you now use is 4.524?

A. That is the average on the proportions you know the contract covers, 40 per cent. of 34 degree and 60 per cent. of 28 degree. If we should use a few gallons more of 34 degree or a few gallons less of 28 degree it would change that, but not materially.

Q. And the stipulation which appears in the contract, requiring you to purchase all your supplies of the Standard Oil Company, that is forced into the contract by the company, if I understand you right?

A. I do not recall ever seeing a contract, Mr. Burr, that that clause was not in, either here or elsewhere.

Q. Well, you say that that is a stipulation which they insisted upon in making the price, that is true, there is no question about it?

A. Oh, they do, they require that that is part of the con-
6081 tract and that is one part, an integral part, of the contract, if
I may use that term.

Q. Now, you referred to the statement of Dr. Marks as to the companies which he found in Brown's Directory, whose average was 3.65 cents per gallon. They were fourteen in number, were they not, or do you recall? If he said they were fourteen have you any reason to doubt that, or do you know?

A. I think I added twelve and made the total twenty-six, so I think it would be fourteen. I think I can check that.

Mr. MATHEWSON: He named them.

The WITNESS: I named mine, but I do not think I named Mr. Marks. I think his were fifteen in number, were they not?

Q. Does it not appear reasonable to you, Mr. Addicks, that if the fourteen or fifteen companies in the State of New York should get their oil in small quantities for 3.65 that a company buying vastly more in quantity should get it for at least less than 4?

A. I think, Mr. Burr, it depends upon the location as well as quantity. There are no other companies that I have seen that are getting their oil under the conditions which New York is getting it; in other words, having a water transportation in addition to the railway transportation. That water transportation must of necessity be an absolute addition to the cost of oil at the seaboard, and all these, of course, would be within the limits of the seaboard. In addition to that I call attention to the storage which all gas companies as a rule have for themselves. I had in Boston a very large storage, but even then
I was backed up when I had a contract with the Standard Oil
6082 Company, I was backed up with the storage supply of the
Standard Oil Company.

Q. Now, you have referred to four companies within the limits of the Greater City of New York, the Brooklyn Borough, Kings County, New York and Richmond, and Queens Borough Gas and Electric Company, and you have made some statements based on information you received from some of the gentlemen engaged in the operation of these companies, have you not?

A. Yes, I have.

Q. Are you the engineer or have you any connection with the New York and Richmond Company?

A. I have not.

Q. You are the engineer or connected with the Richmond Electric Light and Railroad Company, are you not?

A. I am not.

Q. Well, you are familiar with conditions as they exist in the Borough of Richmond, are you not?

A. I do not think I have ever been in the Borough of Richmond but once in my life. I am familiar enough by reading in the papers about it, but that is all.

Q. Am I misinformed when I say that you are engaged in making plans for the construction of a large electric light plant in the Borough of Richmond?

A. Absolutely; if you are speaking to me individually.

Q. Yes.

A. I am not, nor do I know who is.

Q. Now, in the operation of these companies you have referred to the dropping of the oil, etc. In the operation of these companies and in the operation of every gas works, is it not a fact, Mr. Addicks, in your vast experience that you have had here and in Boston and elsewhere, that the human element enters very largely into the successful operation of a gas works; that one man may spend where another may save?

A. I think that is true within certain limits.

6083 Q. So, given the same conditions, the same oil and the same coal, one man may arrive at a better result than another?

A. That is possible.

Q. So that would have to be taken into consideration in arriving at a definite understanding of each case.

A. I shall have to add number 15 to my list on oil and candle power.

Q. So that unless we knew the capacity and character and ability of the various gentlemen who have informed you as to the results in their companies, we would be only guessing at the situation?

A. I think that would be an element which would have an influence upon me. I must know their professional reputation, but in one particular case I know he is a very careful man, and the others I do not know so well.

Mr. Burr: I want to call the Master's attention to page 5958. Strange, uncouth and ungrammatical language has been placed in my mouth during the progress of this case, due to the rapadity with which this record is being made and printed every day, and to which I have not taken exception, but I do object to having placed in my mouth such a word as "consmuption." I ask leave to have that changed to assumption or presumption, which is probably what I did mean.

The Master: We will expurgate that.

Mr. Mathewson: It is a matter of personal privilege, I suppose.

Q. You have referred to the matter of wages, Mr. Addicks, stating that your company has raised the wages of certain classes of employés 10 per cent. in the face of a round robin. Is that correct?

A. Well, I said that another company—that in the shop of one of these other companies they presented a round robin to their 6084 superintendent, and in another station their men had had meetings with a view to making a demand.

Q. Is it not a matter of fact that the Board of Directors of the Consolidated Gas Company voluntarily raised the wages of these employees?

A. It is not.

Q. Are you not aware that within the past three months, while we have been sitting here, that great corporations throughout the United

States have raised voluntarily the wages of their employees 10 per cent., such as the Standard Oil Company, the Pennsylvania Railroad and other large companies and railroads?

A. Yes.

Q. And is it not a fact that this raise in the wages of the employees of the Consolidated Gas Company was due more to public sentiment than the round robin?

A. Well, I think it was a combination of the two, Mr. Burr. When I say it was not done voluntarily, in the whole situation it was not done voluntarily, but we could not resist a demand under the conditions which existed. I do not think it would have been right to have resisted.

Q. Referring to the statement made on page 5978 that the Astoria plant came into active operation on the 3rd of December, will you tell me the details of that a little more. How did the company come into active operation? Are you buying your gas from that company?

A. We have not yet had the account of the cost of that gas made up so far as I know. We will undoubtedly——

Q. Well, it has been supplied to you since the 3rd of December, you are receiving it to-day, are you not?

A. Yes.

Q. To what extent daily?

A. Commencing with about 200,000 feet on the 3rd of December and increasing gradually to about 500,000 I should say, or possibly
800,000, and then the second house was started, as I remem-
6085 ber it, and that was allowed to come up gradually to possibly
a corresponding amount.

Q. By the second house you mean part of the first unit?

A. Yes, the second house of the first unit, and then they were both gradually increased, so that now they are making over 4,000,000 feet a day, the two of them.

Q. You have been receiving that gas since the 3rd of December without any agreement as to what is to be paid for it, is that true?

A. None whatever.

Q. No agreement whatever has been made?

A. No agreement whatever. The amount in December was something like between 40 and 50 million feet for the whole month, so that the average, you see, was a little over a million feet.

Q. The Astoria Light, Heat & Power Company has no right or franchise to operate in the City of New York, as I understand it?

A. No, sir, I do not so understand it.

Q. They operate to-day in the manner Mr. Simpson described through Ravenswood, and the tunnel and mains, it is delivering its gas to your company at the station at 70th Street or 72d Street?

A. At various points. It is going through the transit mains to such points as it would be most convenient to use that gas.

Q. So that sooner or later you will have to agree upon a price for that gas?

A. Sooner or later we will have to arrange for the payment of the expenditure to make the gas.

Q. Well, if that is the price, you will sooner or later have to arrange it?

A. Yes, they cannot run on forever without getting something for their product.

Q. But there is nothing to show that that will be the sole price, the cost to manufacture that gas, or has there been any agreement to that effect?

A. No, but we own all the securities——

6086 Q. I understand, I will never forget it.

A. Well, I do not want you to forget it.

Q. You gave the weights of pipe in Boston. Where did you get those figures, Mr. Addicks?

A. I got them from a blue print, Mr. Burr. If you would like to see it I will produce it.

(Witness produces paper.)

Q. Well, you know that those figures given by you are correct?

A. Oh, absolutely, no question about it.

Q. And do you still think that a single main system on every street in New York would be a perfect absurdity?

A. I never made the statement.

Q. Then we are losing our minds. I see on page 5981, the question was asked:

"Q. What would be your view as to the wisdom of a single main system in New York City? A. Well, applied specifically to the single main system on every street in New York it would be a perfect absurdity."

A. Yes, excuse me, I did say that. I thought you said on the narrow streets.

Mr. Mathewson: The question was if you still thought so.

The Witness: I still think so, yes.

Q. I notice by the public prints, Mr. Addicks, that within the past few days you made the annual report to the Board of Directors of the Consolidated Gas Company and you are quoted as saying that the plants of the gas and electric light companies are physically in the best condition? Is that true?

A. That is my opinion of it, Mr. Burr.

Q. In that report you did not make any report as to the 6087 earnings of the Consolidated Gas Company for the past year?

A. I made nothing further than I think has been stated in the papers.

Q. Do you know what candle power the Philadelphia Gas Works uses, the U. G. I.?

A. Well, I think I have heard, and my impression is it was about 22. That is my impression from what I have heard.

Mr. Mathewson: Do you mean works or city tests?

The Witness: I don't know which it is, Mr. Mathewson, that is my impression.

Q. Do you know that that company receives 28 degree Beaume gas oil at 2½ and 3 cents per gallon in ships alongside the wharf in Philadelphia from the Guffey Company in Texas?

A. I do not.

Q. Is it not a fact that the legally required candle powers of gas in 1905 was an average of 21 candle power, that is, 20 candle power the first six months and 22 candle power the second six months?

A. That is true.

Q. Was not the average candle power furnished according to Dr. Love's test 23.1 candles, that is, the first six months 22 candles, and the second six months, 24.19 candles, according to City's Exhibit 47, page 1198?

A. Of course I do not remember those figures, this is 1905?

Mr. MATHEWSON: If it was, and if it so appears in the exhibit, what is to be gained by asking the witness?

Mr. BURR: Because I am going to ask another question and I want to call his attention to it.

The WITNESS: Do you refer to the Consolidated Gas Company in your question?

Q. Yes?

6088 A. It seems to be the average. I have only checked one single candle power, but it seems to represent the candle power of the stations of the Consolidated Gas Company on different days.

By Mr. MATHEWSON:

Q. Does 24.19 represent the average at the bottom or the average of the whole number taken and divided by the whole number?

A. I would say it was the average of the averages. I have not added it up to check it, though.

Q. If that is so, it would not represent the true average?

A. No, because there would be a greater amount of gas made in the winter than in the summer, it would not be the true average.

By Mr. BURR:

Q. Was not the average candle power of gas tested at the works 25.35 candle power during 1905, see City's Exhibit 62, page 1404L.

Mr. MATHEWSON: Do you know whether that is an average of averages or whether it is made up by taking the total number of tests and averaging them?

Mr. BURR: It is the average of the averages.

A. There is a statement here, average candle-power, coal and water gas stations, 25.35, but I have not checked that.

Mr. MATHEWSON: It appears so in the exhibit is all you can say?

The WITNESS: Yes.

Q. That purports to be a statement of the monthly record of manufacturing averages and results taken from your books?

A. I don't know what the source is.

6089 Mr. MATHEWSON: Whatever the testimony shows.

Q. If that is true and if the average I have previously called your attention to was true, would not those together make altogether a drop in candle-power of 2.25, assuming the purchased gas not to affect the candle-power?

A. That would represent a drop of the averages, it would seem to me, to be put in correctly.

Q. Of 2.25?

A. Well, I didn't add that in my mind.

Mr. MATHEWSON: I understand in getting the lower figure you took Exhibit 47, and took 22 candle as the average stated for the first six months, and 24.19 as stated for the second six months, and got the average of those two sums, which is 23.1 candle?

Mr. BURR: Yes.

Mr. MATHEWSON: And the difference between that and 25.35 would be 2.25 candle.

The WITNESS: Of those figures, that would be as what is represented, yes, sir.

By Mr. BURR:

Q. You spoke of a single system of mains as an absurdity. As a matter of fact, Mr. Addicks have you not used it in 56 per cent. of the blocks of the City of New York, as appears by City's Exhibit No. 102, page 1653 see pp 6103?

A. Now, Mr. Burr, I do not want to quibble about that. But I do not think it is fair for me to assume that. I do not know exactly how to make that answer, but it is simply this, I have assumed in my reply that a single system of mains in every street in a city—that is all I said on that subject.

6090 Q. You would not be understood then as saying that a single main system is not in use in 56 per cent. of the streets of New York?

A. I do not know what the percentage is, but it is in a very large number of the streets. I expressly said that in the case where there was a- large as an eight-inch main on a street in one block, that it was an open question in my mind if it would be better to have a six-inch main on each side. That does not apply where a six-inch main is large enough to supply the block. It is more economical to have a single six-inch main.

Q. You would not say that in the city there are many streets in the remaining forty-four per cent. which could not be perfectly served by a single main system?

A. Of course, I do not doubt that is true, but, of course, there are many streets where there are several companies and a great many mains.

Q. And there is no doubt, as appears by Exhibit 102, that there are many blocks occupied by three, four, five and six mains of the Consolidated Gas Company?

A. I cannot carry that in mind.

Mr. MATHEWSON: Mr. Marks has put in an exhibit here, at great length, which shows exactly what proportion of the streets have two, three and four mains. The witness cannot tell off-hand.

Mr. BURR: I am only cross-examining on the statement he made, that it was an absurdity.

Mr. Mathewson: Putting a single main system throughout the City of New York is an absurdity, and he has expressly said that in many streets single mains can be used to advantage.

Q. Notwithstanding the condition I have pointed out to you with regard to the mains, you still say that the proposition to install a single main system in every street of the City of New York is still an absurdity in your mind? 6091

A. Now, Mr. Burr, I am a little doubtful in my mind what you mean by single main system and what I mean.

Q. What do you mean by a single main system?

A. One main in a street.

Q. That is what I mean.

A. I thought perhaps you considered a single company.

Q. A single main in the street?

A. Yes, I think it is absurd to attempt to pipe New York City in its entirety with one gas main in the street. I did not mean the expression offensively.

Q. I meant to ask you when I was talking about the oil, you spoke of the situation having presented itself here quite recently where you were all out of oil and were saved solely through the weather opening and oil that was not intended for you being appropriated and delivered to you at the station where the need was felt?

A. That is right.

Q. Is that good business management in your opinion?

A. Well, it is a situation of storage oil in the City of New York, and in that station we are erecting a half million gallon tank to endeavor to avoid that situation in the future.

Q. And the occurrence happened in the previous year?

A. True. It is with the greatest hesitancy, as far as I am concerned, that we have the additional supply there. I prefer to have the oil off the island as far as possible.

Q. I will ask you to look at Exhibits 47 and 62 again, Mr. Addicks, and see if these figures that I will now state are correct. You give the candle power drop (p. 5934) as follows:

December, 1905, 3.12 candles——

Mr. Mathewson: No, he did not give it; that is the exhibit you put in, is it not?

6092 The Witness: It is the exhibit Mr. Page put in there through Mr. Edgerton. No, December, 1905, we put in——

Mr. Mathewson: I thought you were referring to the Exhibit you have before you.

The Witness: No.

Q. You give candle power drop as follows:
February 1905, 3.75?

A. In February, 1905?

Q. Yes.

A. That is the exhibit Mr. Edgerton put in.

Q. Now, it appears from these Exhibits 47 and 62, that in December, 1905, the candle power was as follows at the various stations:

25.17	14th Street
26.51	21st Street
24.45	42nd Street
24.21	44th Street
24.42	99th Street

A. Yes.

Q. Then the total average at stations is 24.92?

A. Well, I have not calculated that. No, sir, I do not make it that. Substantially 24.95.

Mr. MATHEWSON: That would be the arithmetical average of those four averages.

The WITNESS: Of the five averages.

Q. You find the city's test to be 24.06 for December?

A. Where is that?

Q. That must be on Exhibit 62.

A. Yes, 24.06 is there. (Exhibit No. 47.)

Q. That makes the drop in candles .86 instead of your 3.12 candles for that month, would it not?

6093 Mr. MATHEWSON: But his was only 21st Street. Mr. Edgerton dealt only with the 21st Street station and not with all the stations.

The WITNESS: That is correct, so far as I can see.

Q. That is right, is it not?

A. So far as I can see.

By Mr. MATHEWSON:

Q. Is it not true that your higher figure of 3.12 came from the records of the 21st Street station only?

A. Yes, sir; 21st Street station only and the others were lower, Mr. Edgerton's figures were lower, if you will remember, in 99th and 44th Streets there was practically none.

By Mr. BURR:

Q. Taking 21st Street station, 26.51 candle power, the city test is 24.06, that would make the drop in candles 2.45 instead of your 3.12?

A. Yes. This is still 1905?

Q. 1905, yes.

A. Taking the 21st Street station?

Q. Yes; 21st Street station is 26.51 and the city test is 24.06, leaving the drop in candles 2.45 instead of your 3.12 for that month.

Mr. MATHEWSON: Not his, that is Mr. Edgerton's figure, you understand, and those are Mr. Edgerton's exhibits.

Mr. BURR: No, this is the map that you introduced yourself, December, 1905.

Mr. MATHEWSON: Very good, then it is ours.

The WITNESS: Where do you find the city tests for 21st Street.

Q. In Exhibit 62; is it not?

A. I do not find it. I did not see it for 21st Street. That is the combined companies, that 24.06, that is not for 21st Street. 21st Street works, this is 26.51 and the city test is 23.39, not the amount which you are giving, which is the average of all the stations. The figure on Exhibit 47 is the combination of all the stations.

6094 Q. And the purchased gas, is it not?

A. If any purchased gas is tested at that station; but those are tested separately. If there is any purchased gas in it, yes, but the figures I have given are correct for the station, and the city test as reported for that station. That 23.39 is correct for 21st Street, city test.

Q. You say the city test is 23.39?

A. 23.39 is correct for the city test at 21st Street.

Q. And the candle power is correct, 26.51?

A. 26.51 is the candle power for the station. I gave that to the stenographer, so I have not that copy here. It is copied.

Mr. MATHEWSON: Well, it appears in the testimony.

The WITNESS: According to Exhibit 62, 26.51 is station test for December from 21st Street, which agrees with what appears for 21st Street as December, 1905, on page 5934.

Q. I understood you to say that the drop in candle power requires an increased amount of oil, is that right?

A. I should say that if there is a drop in candle-power it requires an increased candle-power to overcome that drop, which would naturally require an increased amount of oil.

Q. Now, referring a moment again to your oil contract, are you aware that in Philadelphia the company there divides its oil contract into three companies, the Gulf and Sun, of Texas, and the Standard Oil Company?

A. No, I am not.

Q. Or divides it between two companies, the Gulf and Sun, of Texas?

A. I don't know what the situation is.

Q. Do you know the amount of gas which is manufactured by the U. G. I. in Philadelphia, water gas?

A. No, I do not.

6095 Q. Have you never acquainted yourself with the production of that company?

A. I think Mr Marks gave certain figures, but I don't recall what they are. I have known it years ago.

Q. Well, I am informed that over seven billion feet of gas—including over five billion feet of water gas, is made by that company. Have you any reason to doubt that information or the correctness of that information?

A. I could neither confirm it or doubt it.

Q. Do you know anything as to the conditions prevailing in Philadelphia as to testing candle power? I understood you to say you believed they had the same candle-power as we have here, 22 candle-power?

A. My impression is 22 candle-power. I don't know whether that is correct or not, but I understand there are testing stations.

Q. Don't you know, as a matter of fact, that the companies in

Baltimore, Jersey City, Newark and New Haven buy most of their oil from independent companies?

A. No.

Q. You don't know that?

A. No.

Q. Do you know that these various companies just named make as much or more water-gas than the Consolidated?

A. No, I do not.

Q. I mean all combined?

A. No, I did not.

Q. Have you familiarized yourself with the sources of oil, the great body of it, where it comes from?

A. I don't know how much or how little I know about it. I think I know a good deal about it.

Q. Have you taken pains at all to familiarize yourself with the existing conditions in that regard?

A. I know more or less about it. I don't know how much I know or how little I know. It depends on how much somebody else knows as to how much I know about it. My principal source of information has been from census reports.

6096 Q. Do you know these companies I have called your attention to, Baltimore, Jersey City, Newark, New Haven and Philadelphia use Texas oil.

A. I do not know whether they do or not, but they wont be using it very long I think.

Q. Why?

A. From the evidence in this case Texas oil is about run out.

Q. Do you know what company furnished the oil to Boston in 1906?

A. During the current year?

Q. Yes.

A. I understand it to be the Standard Oil Company.

Q. Are you aware that during the year ending June 30, 1906, the Boston Gas Company used 3,971 gallons of naphtha at 5.52 cents and 6,213,964 gallons of other oils at 4.01, making a total of 6,216,935 gallons?

A. I know Mr. Bemis' quotations and reports to that effect.

Q. And made 1,421,194,000 feet of water gas of about 22.9 candle power with that?

A. That would be the works candle power in that case, I presume. I don't know exactly how much they have made themselves. My memorandum don't go into the question of how much water gas they made.

Q. In confirmation of which I will refer you to pages 22 and 17 of the report of the Massachusetts Board of Gas and Electric Commissioners, and also to the letter of President Richards to whom you referred, of the Boston Consolidated Gas Company.

A. These figures do not quite check with the totals I have but I presume they are right. I see here the candle power 23.13 at the station and 22.7. The candle power given in the gas commission report is 19.37.

Q. The candle power given in the report is what?

A. 19.37.

Q. At what point?

A. Well, it says, the State Inspector.

Q. That is on the street, the mixed gas?

A. That is the testing station, wherever the testing station is.

6097 & 6098 Q. And what is referred to in the letter of October, 1906, from President Richards is the water gas to which we have made reference, is it not?

A. No, I don't think it is all water gas. I think it is water and coal gas mixed in one case. Pardon me. This letter says that it is water gas at the Calf Casture Station, and it says further, "And at out Commercial Point Station for the same period 22.7," but it does not say water gas.

Q. Assuming these figures to be correct, does not that mean and show a make of 4.37 gallons of oil per thousand feet of water gas?

A. I have not got the other figures. Do you want me to make a computation here from these reports?

Q. Yes, to verify that, if you will?

A. What was the total gallons of oil?

Q. 6,216,935.

A. Will you ask Mr. Bemis to add that up again and see what that is. I make it 6,217,935.

Q. That is right.

A. Did Mr. Bemis give the amount of carburetted water gas made?

At 5:05 P. M. adjourned to Thursday, January 24, 1907, at 11:30 A. M.

6099 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity and the CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *January* 24, 1907.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Burr.

6100 WALTER R. ADDICKS resumes.

By Mr. BURR:

Q. When we left off last night we were engaged in doing some figuring, and you undertook to complete your figuring this morning.

A. I have forgotten the exact question that was asked me last night.

Q. What I asked you was, assuming those figures to be correct, does not that mean and show a make of 4.37 gallons of oil per thousand feet of water gas, and you undertook to verify the figures I had previously given you.

A. Now, may I have the number of gallons of oil that Mr. Bemis thought the amount was, so as to check it?

Q. It was 6,217,935.

A. I have it 6,218,096. You will note that there was some naphtha used and marked as used, and also the naphtha unaccounted for was 161, which should be included in the amount used, so there will be two items to be added.

Q. We will accept your figures.

A. The whole amount of naptha, amounting to about four thousand gallons, I make it. By the way, how much is the gas made?

Q. 1,421,194,000 feet.

A. I have taken that same figure 1,421,194,000 and the result is about 4.38 gallons of oil.

Q. So that instead of the 4.37 that I asked you regarding, you make it 4.38?

A. Well, it is 4.375, which I would take as 4.38, it being slightly over .5.

Q. Calling your attention to your testimony regarding Lowell, will you look at the report to the Massachusetts Gas Commission, pages, 22, 19 and 17, and state whether from that report it does not appear that Lowell used 836,032 gallons of oil costing 3.13 cents per gallon to make 189,118,000 feet of water gas, and from such report it appears that the candle power was 18 after this gas was mixed with 338,544,000 feet of coal gas.

6101 Mr. MATHEWSON: Don't think that I have laid stress on Lowell. I have not. You will remember it was brought out by Mr. Bemis and I merely asked Mr. Addicks in rebuttal about one or two statements. I did not introduce Lowell and have not claimed that Lowell is representative.

Mr. BURR: I am now endeavoring to show that the statements he made in his rebuttal were incorrect.

Mr. MATHEWSON: No, you cannot show that, because he did not make any.

Mr. BURR: I call your attention to his testimony at page 5965, in which he says: "The information is that the candle power is about 4½ candles to the gallon of oil in Lowell." So I want to show the contrary, if I can.

Mr. MATHEWSON: All right, I have no objection.

The WITNESS: Now, you gave me a lot of figures that were in various parts of this report, and it requires just as much work as it did in the other case. I ought to familiarize myself with the whole report, instead of taking out such figures as I am asked for in the question.

Q. Change that figure to 893,032 gallons of oil.

A. In other words you are including 60,000 gallons of naphtha this time, are you?

Q. Yes.

A. That is at 5.3 cents a gallon.

Mr. MATHEWSON: Of course, now, Mr. Burr, the figures you are asking the witness to make are from statements of the officers of this company made to the Massachusetts Gas Commission, and any other statements made by officers of the company I shall expect to present on the same theory, they are equally competent.

6102 Mr. BURR: You have. He has stated that the information he gets is so and so, and comparing the information contained in the official report to the gas commission——

Mr. MATHEWSON: If you want that, all right, only I want it to appear.

The WITNESS: Mr. Burr, in order to make this computation I have to take the amount on hand, the amount received and the amount used and see if the amount agrees before I can check up these figures, as I did in the case of the Bay State. In the first place, I find that considering the amount of oil on hand as of January 30, 1905, adding to that the amount received and subtracting what is said to be used, does not bring out the amount on hand at the end of the year, unless I have made a mistake in my calculation, so that is error No. 1.

Mr. MATHEWSON: That is in that report?

The WITNESS: That is the amount of fuel and other oil in the report.

Q. Does that appear by the report?

A. Yes. Now, if Mr. Bemis will kindly check these figures I will go on a little further.

Mr. MATHEWSON: Can we not finish this up here? I do not think we should chop up this particular company, I do not think we should take a little here and a little elsewhere about this company.

Mr. BURR: No, I want to finish it up myself.

Q. Well, I will not press that matter further, we will not take any time about it.

A. Mr. Burr, may I tell you something about this last question in regard to the amount of oil used in the Boston companies?

Q. Yes.

6103 A. I would like to state that I do not think that report is for a year, although it appears to be on the face of it, the annual report for that year. I think it includes a part of the previous June, a portion of June, 1905, as well as from July 1, 1905, to June 30, 1906. I have here the sworn statement of the accountants which agrees substantially with the Gas Commissioner's report and shows it is for more than a year.

Q. Now, take Fall River. Fall River you have——

Mr. MATHEWSON: I did not ask him a word about Fall River. I did not mention Fall River. It was Lowell and Boston and Lynn.

Mr. BURR: And you referred to other Massachusetts companies.

Mr. MATHEWSON: And he said he made no comparison with Lynn because part of that was electricity.

Mr. BURR: I will leave that out, then. By the way, I want to call attention to a correction that ought to be made at once, on page 6095. It reads, "Well, I am informed that over seven billion feet of gas—over five million feet of gas is made by that company." It should read "Over seven billion feet of gas including over five million feet of water gas."

Mr. MATHEWSON: At page 6089, while you have it right before you, you referred to City's Exhibit 102 as page 1563. It should be page 1653, and the exhibit referred to, of course, was the exhibit made up by Mr. Marks from his measurement of the maps.

Mr. BURR: Showing a duplication, that is all.

Mr. MATHEWSON: I understood it, yes, but even the percentage of duplication, of course, would be affected by the errors.

6104 Q. Now, calling your attention to Lynn, do you find from the same report to which I have called your attention, pages 22, 19 and 17, that Lynn used 1,007,166 gallons of oil, costing three cents a gallon, to make 206,197,000 feet of water gas, or 4.88 gallons per thousand feet, and that this water gas, when mixed with 230,842,000 feet of coal gas, yielded 18.2 candle-power, according to the State tests?

A. I also find an error in this report.

Q. Are you speaking of the report of the Gas Commission?

A. Of the Lynn report to the Gas Commission as copied here. I found that they use 20,913 tons of coals, which I assume to be gas coals, they say carbonized, which would make a make of about

10,000 feet to the ton or 209,000,000. This states that the coal gas made is 23,084,200.

Q. That has nothing to do with the water gas, has it?

A. Well, it has—yes, in this sense, that you have the total make which is composed of coal gas and water gas, and if the coal gas is only 23,000,000 we would have to subtract 23,000,000 from the total make which would make a very much larger amount for water gas. If the cypher is left off, I would like to know it.

Mr. MATHEWSON: I do not think we ought to be called upon to testify upon a report which is apparently incorrect and which counsel for the defendant or his witness thinks probably would be corrected by doing something else. It seems to me——

The MASTER: It seems to me that the value of this kind of evidence is not commensurate with the time it is taking, in view of our limited time.

Mr. BURR: Well, that is all I will ask on that point.

6105 Q. I will ask you, how do you reach your figures of candles per gallon for your company and for Lowell?

A. I had the figures from Lowell from a letter from Mr. Pease, who was the superintendent. So far as our company is concerned, from our own records.

Q. Do you know where the 28 degree oil used by your company comes from?

A. From the Standard Oil Company, that is as particular as I can give you.

Q. Does it not come from Texas?

A. 28 degree?

Q. Yes.

A. I did not know it did.

Q. Have you not used a good many millions of gallons of Texas oil in New York during the past three years?

A. Not in the Consolidated Gas Company, so far as I know of.

Mr. MATHEWSON: It comes from the Standard Oil Company, he says. Mr. Emery, after his test, said part was Pennsylvania oil and he thought that part was not, but that was as definite as he could be.

Q. Are you aware that most of the five million gallons of storage capacity which you stated was possessed by the Gulf Refining Company in New York harbor could be used for storing gas oil?

A. Well, any tank that is suitable to store any degree of oil can be used for any other degree of oil, I should think.

Q. Are you aware that that company now ships oil by barge in this harbor to some of the four companies in this city that you have testified about?

A. Yes, it is my general information that they do send by water; to what extent I do not know.

Q. To which company?

A. Well, my impression is that they do both to the Kings County

and the Rockaway Company, Far Rockaway—the Queens
6106 Borough Gas & Electric Company, I think, is the correct name for it.

Q. You refer to the difficulty of drawing deductions from Lynn, because it is a combined electric and gas plant. Did you observe that the profit from the gas alone at the price of 90 cents amounted to $160,414.42 during 1905-6 before the reduction to 85 cents on October 1st, 1906?

A. I would have no opportunity to observe that, Mr. Burr. The returns are not published, Mr. Burr. Mr. Bemis is the only one who has the advantage of having that information.

Q. Now, you stated in regard to Boston that the Boston Gas Company secures about $30,718 profit from the gas it sells to other companies and $130,000 from the electric business, or a total of $160,718, or about 4.6 cents per thousand feet of gas sold, and that without this profit it could not have reduced the price voluntarily from 90 cents to 85 cents from July 1st, 1906.

A. I do not remember making that statement in that form, Mr. Burr. My statement was that without that they could not make the profit they did in that year without an additional price of gas, equal to 4.6 cents. I do not think I referred to the question of their reducing it.

Q. As a matter of fact, did not the company last year, selling gas at 90 cents, pay 8 per cent. dividend on its stock of $15,124,600?

A. They paid about 8 per cent. dividends. I would say also in regard to electric light, from glancing over this report last night it would seem to indicate that they made a little more on their electric light than the figure I gave here, but I was not able to check it. If you will pardon me, I will check that here with this other report. From the statement I gave yesterday from the president I had $130,000 for the electric business. According to the computation I
6107 have just made from the report of the audit by Harvey Chase & Company, if I have made no mistakes in the computations——

Q. Where does that audit appear?

A. In the publication according to law in the Boston papers. Mr. Bemis, I think, has a copy of it also. I find that the expenses for electricity were $87,405.20 and the receipts for electricity $225,135, and the difference between those two sums to be $137,729.80. I used $130,000.

Q. Then every 1 per cent. dividend means $151,246, does it not?

A. It varies from time to time, Mr. Burr. That may be true, but their notes payable increased over seven hundred thousand dollars for that year, which would affect it as far as the earnings are concerned. I merely call attention to that, and the capital is slightly changed for this year over last year.

Mr. Mathewson: You mean capital stock?

The Witness: I will not be sure about that. No, the capital stock is the same.

Q. Well, therefore a reduction of $160,000 in the profits would mean a reduction in the dividend of 1.6, or a reduction to 6.94 per cent.?

A. Pardon me, I have not answered your other question yet. May I answer that before I take up the other one?

Q. Yes.

(Question repeated as follows:)

Then every 1 per cent. dividend means $151,246, does it not?

A. That is correct.

Q. Therefore a reduction of $160,000 in profits would mean a reduction of the dividends of only 1.06 per cent., or to 6.94 per cent., would it not? It would mean a reduction of 1.06 per cent., or from the 8 per cent. to 6.94 per cent.

6108 Mr. MATHEWSON: But it is not shown, Mr. Burr, that the 8 per cent. was when the company had a large surplus from which it may have taken, and undoubtedly did take, I think, a portion of that, as will be made apparent.

Mr. BURR: We have only asked the question.

Mr. MATHEWSON: Now, you ask if the earnings be reduced 1 per cent. They have no relation to each other. One is earnings and the other is dividends paid.

A. Without working it out carefully, 1 per cent. being 151 and for 9,000 more would be less than one-tenth. I imagine the figures are correct, so far as a reduction in the amount applicable to the dividends of that amount would produce a reduction in the probable dividend in the amount stated.

Q. But if the company did not have an electric light business, on that sale of gas to the other companies it would need less capital, would it not?

A. Well, Mr. Burr, you will see from the balance sheet of the company or from any statement of the company that the property of the company is very much in excess of the capital, and whether it had the electric light plant or not it would have at least as much capital as it has now, still a large surplus.

Q. Well, the capital is based on both plants, gas and electric light, isn't it?

A. Undoubtedly. It is based on the sum of its assets unquestionably.

Q. Well, assuming it needed less capital because of the absence of electric light business or the sale to other companies, the gas produced would not average anything like 1 per cent. on the gas capital, would it?

A. Well, that is a question of what the percentage return, $130,000 or $137,000, whichever may be correct——

6109 Q. I mean assuming there were no profits from the electric light or gas?

A. Well, there would still be a less cost. It would depend upon the profit made from the electric light end of the business, and according to my rough computations here that has very much larger return than on the gas. I think that affects the situation.

Q. Well, you took all the profit from the gas, didn't you, in the reduction that you made?

A. Yes, but I am assuming now you are going to take all the profit off, the return of the capital invested in the electric light business, suppose it is $700,000, and $70,000 would be 10 per cent. a year for profit but this is $130,000, showing there is 15 per cent. or more profit on the electrical end of it, capital invested. Of course, that would leave out the capital invested in the gas business.

Q. The point is that if you are going to take off from the dividends you must assume there is less capital upon which dividends are to be paid?

A. If the capital were exactly the same as the assets that is undoubtedly true, but that is not the case here?

Q. Now, before the Massachusetts Gas Commission, in the hearing two years ago about the consolidation and about the prices of gas of the Boston companies, you presented a table, did you not, showing that the depreciation on the electric plant was 3 per cent. on the then electric assets of over $800,000, or $24,000 odd and should be included in the cost of electric light, is that so?

A. I don't recall that. I may or may not.

Q. Assuming that it be so, that would make an allowance of 6 per cent. on these assets and would amount to $49,000, would it not?

A. I don't think it is necessarily a parallel case, because that Brookline Electric Company at that time, which was with the gas, was fully capitalized to its full value; that is to say, the assets 6110 of the company were not exceeding the capital stock or certificates of indebtedness, so that while that might be done at that time it might not necessarily be done at this time. If you will let me refresh my memory by referring to the record I might be able to answer.

(The witness is handed a book.)

Q. Well, Mr. Addicks, we won't stop now——

A. I want to see if this is my testimony. If you will show me that it is first. I don't say I did not present the table. I don't recall presenting the table and this seems to be the testimony of Robert Grant and not my own at all.

Q. Who was Robert Grant?

A. I think he was auditor of the company at that time, and he states that his 3 per cent. is taken from Mr. Bemis' figures; 3 for electricity and 5 for gas.

By Mr. MATHEWSON:

Q. Making a total based on Mr. Bemis' assumption?

A. Pardon me. Five cents for gas and 3 per cent. for electricity.

Q. Do you mean five cents Professor Bemis allowed for depreciation per thousand feet of gas?

A. Yes, sir; that is as I understand what is stated there.

By Mr. BURR:

Q. You stated, and I believe it is generally conceded, that the maximum price of 90 cents has been voluntarily reduced by the Boston Gas Company to 85 cents in July, 1906?

A. I understand that has been done.

Q. And it continues to sell at that price although, as you say, it has a right to restore the price to 90 at any time?

A. It has not made any change so far as I know up to the present time.

6111 Q. Did you not testify in Boston on the investigation before the State Gas Commission, January 30, 1905, that after making proper allowance for depreciation $1.10 would have to be charged to yield 8 per cent. dividend?

A. I would like to have my testimony pointed out to me so that I can refresh my mind. It is three years ago.

(A book is handed to witness.)

The WITNESS: This table looks familiar. If you refer to page 694 of printed testimony, hearing before the Board of Gas and Electric Light Commissioners in relation to production and price of gas in Boston, and published November, 1905, by the City of New York library——

Q. That is the book I refer to. Now, calling your attention to that, is it not true that less than two years ago you testified that after making proper allowance for depreciation $1.10 per thousand cubic feet of gas would have to be charged to yield 8 per cent. dividend?

A. My statement in this table as shown me is as follows: It is assuming a combination of then independent works in the city of Boston under the then existing conditions of expense as existed, 1903-04, I say that allowing for the cost of labor and material and allowing ten cents for contingency that the difference between one dollar and that amount, considering the fixed charges, would only yield 24.74 cents per thousand cubic feet; that the amount required to pay the interest and dividends as then existing amounted to 41.56 cents, leaving a deficit of 16.82 cents per thousand.

By Mr. MATHEWSON:

Q. Including dividends, of what per cent., 10?

A. Including dividends of 10 per cent. and interest on such outstanding obligations as then existed.

6112 By Mr. BURR:

Q. Then I fairly stated what you contended at that time, that it would take, as you say, under the conditions as they so existed—that it would require the company charging $1.10 a thousand cubic feet of gas in order to pay 8 per cent. dividend?

A. Well, it does not show that specifically on that table; it shows simply deficit in earnings of 16.83, which would make it 1.1683 and not 1.10.

Q. We won't be technical about it. Didn't you testify before the Gas Commission, as I have stated?

A. Not on the table shown me by Mr. Bemis. Now, there is another table on page 693, which shows that the price of gas, 1903-04, cost, plus 10.5 cents and 8 per cent. dividends, 1.1066.

Q. 1.1066 would be necessary to be charged by the company per thousand feet of gas?

A. Under the then existing condition of things in Boston.

Q. Now, as a matter of fact, hasn't that company paid 8 per cent. dividends for the year June 30, 1905, with a price of only 90 cents?

A. That company did not exist at that time. That was a suppositious company.

Q. I mean to say the consolidation of these companies?

A. The consolidation of those companies did take place, and they have paid 8 per cent. dividends last year on $15,124,600, and I might add that the president has stated——

Q. No, just answer the question. And the price was 90 cents?

A. Without any allowance at all for depreciation of plant.

Q. Did you not also state at the same investigation, at page 686, 694, that at $1.00 per thousand cubic feet the dividends could only be 4.54 per cent.?

A. That is covered by my answer before in regard to the deficit of 16.82.

6113 Q. And the fact still remains that at 90 cents it paid 8 per cent.?

A. These companies did not exist.

Q. The fact still remains that these consolidated companies the next year paid 8 per cent. dividend, the price being 90 cents?

A. The Consolidated for last year, in 1905-6, my figure is for 1903-4. This is about the 1st of January, 1904, and the year ending June 30, 1906, they paid 8 per cent. dividends without depreciation.

Mr. Mathewson: I think you are confusing earnings and dividends, Mr. Burr, which have no necessary relation, certainly not so close as that.

Q. Is it not true in warm weather gas may have a candle power at the burner equal to that at the works, whether due to the picking up of enriching material in the holders and mains and services, or from whatever the cause may be?

A. I think that the station candle power in the summer is apt to run more closely in the burner—consumer's burner—than it is in winter; the same observer taking a candle power in each case.

Q. In the Boston gas case before this Commission, at this investigation to which I am still referring, you added one-half cent for bad debts and ten cents per thousand feet for depreciation and contingencies, did you not?

A. Yes, sir.

Q. As actual operating expenses you added those two items to carry operating expenses?

A. As the amount to be allowed on the cost of gas for a given year, as representing what the cost of gas would be on that period.

Q. On page 778 of the record of that investigation you were asked:

> "So far as you know this is the only time that ten and a half cents has been added on the cost of manufacturing and the cost of distribution by your company?" 6114

And did you not reply:

"No. I cannot answer that question; I cannot say yes or no. Q. Why not? A. Because I cannot remember; that is the reason. Q. You don't know of any other company that does it? A. No."

You so testified did you not?

A. That sounds very much like it, only I thought I added that Mr. Bemis did.

Q. Do you know now of any such companies?

A. Oh, there are a great many of them, yes, sir.

Q. Well, the Boston Company, for one, does not do it, does it?

A. The Boston Company now?

Q. Yes.

A. Well, the Boston Company made a statement before the Gas Commission within three weeks that at least five cents should be allowed for depreciation.

By Mr. Mathewson:

Q. Through Mr. Richards?

A. Through Mr. Richards.

By Mr. Burr:

Q. But they have reduced the price and they are not doing it?

A. Well, they have a very large reserve fund between capital and value of the plant. They can throw away a very large portion of their plant without involving their capital at all. The amount of ten cents a thousand for forty odd years at the present output. And besides, they make these returns on the electric light and the gas amounting to $170,000, which you have neglected entirely in asking me these questions about earnings in Boston. 6115

Q. You were asked still further by the Commission with regard to this proposition presented by you—asked on page 777: "Q. Do you know of any company in the United States, possibly excluding your own, which takes the price of gas and the cost of distribution and adds ten and one-half cents to cover these things? A. I don't know."

A. I think that is right.

Q. Then you were asked: "Q. Then this is an original idea on your part, that that is a fair leeway?" and you replied, "That is my judgment." Is that right?

A. I think so.

Q. You were asked, "Q. Do you know of any other companies that have adopted this same basis for arriving at the price to be charged to the gas?" and your answer was, "I don't remember."

A. Yes, sir. I won't say definitely whether that was the way I replied to it, but it sounds familiar.

Q. Well, you have the record before you?

A. Well, I know, but it is a printed record from the original record. This is a reprint in New York from the evidence in Boston.

Q. What was the date of your testimony in Boston?

A. I think January, 1905.

Q. Well, now, you testify you think, judging from the record there and your own recollection, that you did not remember of any other company that made such a charge?

A. At this late day——

Q. Do you remember any company that existed at the time you gave your testimony that made that charge?

A. You mean at that time?

Q. At that time.

A. The only thing I know is Mr. Bemis' statement that Mr. Vanderpool said five cents should be allowed for water gas and ten cents for coal gas, whether they made that charge on the books I don't know personally.

6116 By Mr. MATHEWSON:

Q. And you know, Mr. Bemis testified in Philadelphia that ten cents ought to be allowed?

A. He testified in Philadelphia that ten cents should be allowed on the coal gas. He testified in this case.

By Mr. BURR:

Q. That was ten years ago.

A. In Philadelphia, yes. But the testimony in regard to Mr. Vanderpool was only 1905.

Q. Mr. Bemis has explained that as a quotation from somebody else's statement already and given a full explanation in regard to it. But I want to press the question, do you know of any other company besides the Consolidated Gas Company charging this ten cents as against the cost of manufacture and distribution of gas?

A. Yes, I do know of other companies. I cannot enumerate them.

Q. You don't remember their names now?

A. I know a man who has charge of a large number of gas companies and he tells me he is doing the same thing. Mr. Cowdry testifies to ten in Chicago; whether he is doing it in St. Louis or not I don't know.

Q. You don't know whether they are doing it or not at Chicago or St. Louis?

A. I don't know whether they are doing it at St. Louis. This gentleman showed me his accounts—a list of his accounts in which ten cents appeared, so I know from his statement that he is doing it. A man does not usually have access to the books of other companies or information of other companies.

Mr. BURR: I have found that to be the case.

Mr. MATHEWSON: But you were not in the gas business, Mr. Burr.

6117 Q. Do you know what the companies in Buffalo that Dr. Humphreys is connected with have reported as to the cost of oil?

A. No, sir; I do not.

Q. Or at Syracuse?

A. Unless Syracuse is one of those eight companies, but I don't recall it now. I did see the Syracuse testimony, but I don't recall what the price of oil was. I have that testimony, but I don't recall the amount.

Q. You said something, I think, about you would have to know the penalties which were inflicted upon companies for transgressing the law regarding candle-power, as one of the elements of the thirteen elements or factors that you referred to in making up your mind as to what the conditions actually were regarding candle-power and oil in that direction.

A. In this way, if you want the explanation. If the penalty of a company was around one dollar for violating the law they might carry one candle-power. When the penalty is one thousand dollars for violating the law they could not afford to risk the one thousand dollars on the material or the closeness with which they tried to adjust themselves to the law, and if there was no penalty whatever and no inspection they might use a jet photometer in the works, and so the candle-power might or might not be different or might vary three or four candles.

Q. I merely wanted to call your attention to penalties that are imposed under the English law, and ask you if you are familiar with them. I have special reference to the book entitled *Reeson's Complete Gas and Water Acts,* 1817-1902, with full index, by which it appears, on page 338, regarding the candle-power penalties for failure to keep up the candle-power:

"If on any day the gas supplied by the company at any testing place is of any less illuminating power than it ought to be
6118 under the special act, the company would be liable to the following forfeitures:

"For the first half of a candle of defective power forty shillings and for the next and every subsequent candle of defective power a sum not less than twenty-five pounds, and not exceeding 100 pounds, having regard to the relative quantities of gas manufactured by the respective companies."

Are you familiar with that?

Mr. MATHEWSON: You haven't the whole thing there by any means. You have not read the whole act. There is a qualifying or saving clause there which you have not read.

Mr. BURR: Very well, I will read the remainder of it.

"Provided always, that the controlling authority of any testing place having recovered one forfeiture in respect of defective illuminating power in the gas supplied by the company at one testing place on any day, shall not be entitled to any further forfeiture in respect of illuminating power by the gas supplied by the company at any other testing place, of such controlling authority on the same day."

Mr. MATHEWSON: We have five testing places to the Consolidated.

Q. Don't you know there are four testing places in London for this same company, for the South Metropolitan?

A. No, I don't know how many testing places they have. I am more or less familiar with that act. I have read it before, but what answer do you want me to make as a basis of that?

Q. Well, I ask particularly whether in making the answers which you did with regard to oil and the candle-power, you had in
6119 mind this provision regarding the infliction of a penalty under the English law, the assumption having been all

through this case by the Consolidated and by counsel, it seems to me that the penalty imposed here was greatly in excess of any other penalty that was imposed in any other case.

Mr. Mathewson: Grossly so.

A. I had in mind when I made that answer any penalty established by any statute at any place, and I said that the amount of the penalty would have a marked influence on the quality of material that you would use in your manufacture and the closeness with which you would run to the legal requirements. On the basis of what you read the New York penalty is very much heavier, as I read it. It is claimed that we can be fined for every violation, and there is a test made now for every station. I think there are five in number, so that would make five thousand dollars on any one day, but unless I am in error, the law does not say that it should only be once a day, either, but I think as often as the inspector may see fit, and they may increase the number of testing stations, and I don't know where it will end, and there is no leeway whatever, and besides that the burner is not specified. In Massachusetts it says it must be the best burner applicable to the gas, and the consequence is they use a table top tip. If you give one-half or three-quarters of a candle power higher than other burners. It makes a great difference how the law is drawn and its application. I think your first fine here of 25 shillings is about $10.

Q. Did I understand you yesterday to say that as a result of the Astoria plant that the amount of oil that you will need will be decreased or diminished?

A. I said if we could make coal gas under the present law, 6120 we are restricted in the amount of coal gas we can make, because the candle power is in excess of what you can commercially supply coal gas—in other words, it is not commercially possible to supply coal gas exceeding a candle power of 19 candles.

Q. You have undoubtedly studied this question of candle power very extensively. Are you familiar with the fact as stated by the Brooklyn Union Gas Company that for several years of the past five years they have been distributing gas at 25 candles?

A. They are not making a foot of coal gas, as I understand it; not a foot. I don't question it in water gas. It is coal gas I am talking about. Now, will you give me that other question again, I don't think I answered it.

The Stenographer (reading): Did I understand you to say yesterday that as a result of the Astoria plant that the amount of oil that you will need will be decreased or diminished?

A. For every thousand feet of coal gas we use at legal candle power we would probably use two or more gallons of oil under the present laws.

Q. In the future?

A. No, now. We do that now, according to the testimony. That if they made a thousand feet of water gas it would be something over four gallons, so that as coal gas displaces the water gas we use that much less oil per thousand feet, but if we had eighteen candle power it would be very much better because it takes a very large quantity of oil to get this 22 candle power which cannot be operated outside of carburetted water gas, and therefore we must make the water gas in certain proportions.

Q. But you won't need to make so much water gas with coal gas in Astoria?

6121 A. Yes, sir, because we have to enrich our coal gas with water gas to get 22 candles. We cannot sell 22 candle coal gas unmixed with water gas. It will smoke every ceiling so we cannot sell the gas.

Q. Do I understand you to mean that no-withstanding the operation of this coal gas plant which started up December 3d, your supply of oil will not diminish but rather increase?

A. That depends entirely on the relative amount of coal gas and water gas. That might diminish to some extent—how many thousand gallons I would not like to say.

Q. Referring for a moment to the drop candles to which your attention was called yesterday, you have given the apparent drop of the 21st Street station as 3.12 candles between that station and the city test office for December, 1905. You figured the average drop between all the stations as against the city authority as .86 candles. Does not this show a very great difference between the candles total average of oil gas and the drop 3.12 candles you have given for 21st Street? In other words, as a commercial proposition, is not the actual and plain average loss of .86 candles for December, 1905, on all the gas of the Consolidated Gas Company very much less than might be deduced from the stated loss of 3.12 candles at the 21st Street station?

A. That is a very involved question. I don't know whether I followed it all. In the average candle power involved appears the average of the coal gas as well as all the water gas. I don't know how that phase of it would affect the entire averages, but your general average is lower than 21st Street, but please do not forget that 44th Street and 99th Street do not show the same drop as 21st Street in December; materially less.

Q. One question with regard to the mains——

6122 A. May I put in one thing apropos? I was asked yesterday about where our candle powers are taken. Those are taken at the outlet of the holder, not at the inlet, and invariably it is a candle power of the gas made at the station, with the exception of 14th Street, where it is a mixture of other gases to raise the candle power of 14th Street gas.

Q. Your understanding is, and your information is, that at one time here there were various gas companies competing together for business in the same territory?

A. I so understand it.

Q. There was a gas war here?

A. Yes, sir.

Q. And so in that territory there are the mains and piping of the various competing companies?

A. I understand that to be true.

Q. And those mains and pipes still remain in those territories?

A. They are supplying gas from them to other companies as they exist to-day. The company has its own mains and is supplying gas from its own mains.

By Mr. MATHEWSON:

Q. To its own consumers?
A. To its own consumers.

At 1 P. M. a recess was declared till 2:30 P. M.

6123 After Recess.

Mr. Kirby also was present.

WALTER R. ADDICKS resumed.

By Mr. BURR:

Q. There is just one question I want to ask you with regard to the uncorrected gas and corrected gas. You say in 1905 the Consolidated Gas Company obtained candle power per gallon of oil as follows: Uncorrected gas, 5.73 candle power to 5.98 candle power?
A. Yes, water gas works.
Q. Corrected gas 5.42 to 5.74 candle power?
A. That is right.
Q. Refer to City's Exhibit 62, page 1404-L, and explain this. Do you not find in 44th Street 5.13 and in 99th Street 6.88 candle power per gallon?
A. I do not.
Q. There it is; is not that 44th Street 5.13 and 99th Street 6.88?
A. My statement is for the entire year, Mr. Burr. Your statement is for one particular month. Mine is the average for the entire year.
Q. You do find it there for the twelve months?
A. Yes, but my figure is 5.42 and this figure is 5.42.
Q. Then you wish to be understood that the statement you made is for the entire year?
A. The average for the entire year of twelve months.

Mr. BURR: I am not going to ask Mr. Addicks to do any computation, but I want to read on the record certain statements from the report of the Massachusetts Gas Commission with respect to Lynn and Lowell.
Mr. MATHEWSON: I think I shall object to that; I do not see why you should read from it. If you have a question to ask the witness, that is another proposition.
6124 Mr. BURR: I will hand you the report and ask you to verify it.
Mr. MATHEWSON: I thought you withdrew that, that the figures were not correct and were not checked. Is it worth while to put some figures on this record which may be incorrect?
Mr. BURR: These figures are correct, and it is important, because it is a comparison between the value, so far as the result is con-

cerned of the cheaper oil in Boston and the oil used by the Consolidated Gas Company.

Q. With respect to Lynn, Mr. Addicks, do you find on page 22 of the return as it appears in the report of the Massachusetts Gas Commission for 1905, that the company had on hand at the beginning of the year 59,200 gallons, during the year 1,013,966 gallons, carbonized 1,007,166 gallons and had on hand at the end of the year 66,000 gallons?

A. That appears there, yes.

Mr. MATHEWSON: It appears in what? Is that the original report?

The WITNESS: In this copy.

Mr. MATHEWSON: In what copy?

The WITNESS: A copy of the report?

Mr. BURR: To which reference has been made all through this hearing.

Mr. MATHEWSON: But they were found to be incorrect.

Q. Do you find the average candle power determined by the State inspector on page 19 with the mixed coal and water gas at the State testing stations to be 18.2 candle power?

A. It so appears on this page.

6125 The MASTER: Is that copy of the report now shown the witness one that has been used heretofore in this proceeding?

Mr. BURR: Yes.

The MASTER: And marked in evidence or for identification?

Mr. BURR: No, but it was the report referred to by Professor Bemis in giving his testimony.

The MASTER: What is there to authenticate it? Is it a sworn copy? What proof is there as to the correctness of those manuscript entries?

Mr. BURR: Professor Bemis swore as to the manner in which that copy was made in the office of the Commissioners of Gas in Boston at the time he was examined.

The MASTER: Is it certified to be a correct copy by the clerk?

Mr. BURR: And he testified as he went there and verified the figures on water gas, oil and candle power.

Mr. MATHEWSON: I do not remember whether he did or not. The oil figures for one of the companies that Professor Bemis has produced this morning were confessedly incorrect, so the paper was withdrawn by counsel.

Q. Referring to the printed report of the State Gas Commission in Massachusetts relative to Lynn on page 82 of the Appendix do you not find that the total assets both gas and electricity were $1,792,602.11 and the gas profits $136,344.26, that is for 1904-5?

A. This report that I have here in manuscript is for the year ending June 30, 1906.

Q. Yes.

A. Whereas the report you have just handed me is for the year ending 1905, the year before.

6126 Q. That is right.

A. They are not the same reports at all, they are a year apart.

Q. That is right.

A. You want to know whether on page 82 of the Appendix the total assets on the books of the company are $1,792,602.11?

Q. Yes.

A. That is correct.

Q. And the gas profits $136,344.26?

A. The gas profits as reported, $136,344.26.

Q. As a matter of fact, you see that the gas and electric assets are separately given there on that page, and on the page preceding?

A. They are given—they are not separately given in two totals, but they are comprised in the $1,792,602.11, and can be separated to a great extent.

Q. You observe that among the electric assets on pages 81 and 82, real estate, $118,719.63?

A. That is the electric real estate.

Q. Steam plant, $131,928.88?

A. Yes.

Q. Electric plant, $127,855.48?

A. Yes.

Q. Electric lines, $159,676.80?

A. That is correct.

Q. Transformers, $12,570?

A. Correct.

Q. Meters, electric, $19,623.39?

A. Yes.

Q. Arc lamps, $5,500?

A. Correct.

Q. Due for electric light and power, $29,904.80?

A. Correct.

Q. And there are other items also there, are there not?

A. Correct. Fuel on hand, electric, $2,186. Carbons on hand, $1,774. Incandescent lamps on hand, $1,337. Globes on hand, $318. Electrical fixtures on hand, $242.78. I left out the cents in those other cases. The horses and wagons are not divided. Sundry accounts due the company, I do not see that that is divided, nor do I see the materials on hand for electric, other than those I have mentioned, if there are any.

6127 Q. Calling your attention to page 17 of the report for the year 1905-06, of the Massachusetts Gas Commission with regard to Lynn, if we assume the correctness of those figures we had under dispute this morning and that the amount of water gas is correctly given there at 206,197,000 feet, on page 17 of the return, could you not readily find the gallons of oil used per thousand feet by dividing the oil by the water gas made?

A. Yes.

Q. On page 22 of the Lowell return will you simply read the figures on naphtha and other oils on the two marked lines which are handed you?

Mr. **Mathewson**: That is Professor Bemis' copy of gas for the year ending June 30, 1906.

Mr. **Burr**: Yes.

A. Mr. Burr, are you going to ignore the unaccounted-for oil?

Q. Will you just kindly read those two lines?

A. You want that which is under the third column from the left-hand side headed——

Q. Under each column?

A. Then I did not understand the question.

Q. On page 22 of the Lowell return will you simply read the figures on naphtha and other oils on the two marked lines which I handed you and the headings above each column in which they appear.

A. Naphtha on hand, June 30, 1905, 44,930 gallons; received during the year, 20,034 gallons—I cannot read the figures—it appears to be 20,034 gallons; carbonized during the year 60,009 gallons; unaccounted-for, blank; on hand, June 30, 1906, 4,955 gallons; average cost per gallon of each kind used at the works, 0.053; other oils on hand, June 30, 1905, 98,492 gallons; received during the year, 1,114,027 gallons; carbonized during the year, 833,033 gallons; unaccounted-for, blank; on hand, June 30, 1906, 373,622 gallons; average cost per gallon of each kind used at the work, .0313.

6128 Q. I have just one other question to ask you. You observed on page 17 of the return for 1905-6 that they made 338,544,000 feet of coal gas and 189,118,000 feet of water gas, and on page 19 you will observe that the average candle-power of the mixed gas at the State testing station, away from the works, was 18, and you observed also that Mr. Pease, the Superintendent, from whom you have quoted, wrote that the candle-power of the water gas before mixing with the coal gas was 21.8

A. The statement here is, as you have stated, that the candle-power of the water gas and so forth, average of candle-power before mixing with coal gas for year ending June 30, 1905, was 21.08.

Mr. **Mathewson**: That is at Lowell.

The **Witness**: Yes, Lowell is what I have been reading from.

Mr. **Burr**: That is all.

Redirect examination by Mr. **Mathewson**:

Q. The mains of the Consolidated Gas Company which were in the streets were here first before the competing companies, were they not, unless some Mutual mains in the streets of New York City?

A. Yes, sir. The Standard and the New Amsterdam were after the Consolidated, but I don't know about the Mutual. I don't know whether that was before or after. The Mutual was before.

Q. Referring to Lowell, did your statement that at Lowell they could average only about 4½ candle power per gallon, rest on your own recollection, or have you a letter from Mr. Pease on that subject stating that in explicit terms?

A. I have a letter from Mr. Pease expressing it and stating it in explicit terms?

6129 Mr. Burr: I have no objection to that letter being introduced in evidence, providing this letter is also introduced.

Mr. Mathewson: You put it in substantially in your question.

Q. On December 13, 1906, Mr. Pease wrote, did he not: "I am trying it under various heats and conditions, and can average only about 4½ candle power per gallon"?

A. He does.

Q. Now, what does the Consolidated Gas Company get in candle power per gallon from their oil?

A. With uncorrected gas from 5.73 to 5.98, depending upon the station.

Mr. Burr: That you have already testified to.

The Witness: It is simply a duplication.

Q. Take the subject of Lynn, assuming the statement to be correct as it has been quoted to you from this report by Professor Bemis or called to your attention, how many candles per gallon does the Lynn oil produce?

A. The figure I have here is 4.88 gallons and candle power of 25.87. Is that the correct candle power in gallons that we have in the testimony?

Q. No, I think not. 18.2 was the official test, was it not?

A. Mr. Burr, have you given us the candle power of the Lynn gas?

Mr. Burr: No.

The Witness: It has not been given. It has only been given for the total gas, that would be mixed gas, and we have not the water gas, and it would be very much lower.

6130 Q. It would be very much lower, yes.

A. Yes.

Q. It is possible without having a record of the unaccounted for oil to make exact determinations of figures that are worth anything?

A. No, sir.

Q. In reference to Lynn, the profits as you have been made to read them are merely a statement purporting to be presented by the company to the State Board of Gas Commissioners of Massachusetts?

A. I so understand those reports.

Q. You do not understand how the expenses were divided as between the electric plant and gas plant in figuring the profits of either one, do you?

A. No.

Q. Would not that have a very material effect upon the cost of gas or electricity as either one or the other might be favored in charging expenses or salaries?

A. It would.

Q. Is it possible without that to make any comparison of value in your judgment?

A. No.

Q. As to the value of the property in Lynn have you any information as to whether the assets have been charged down by depreciation or otherwise?

A. I have not, no.

Q. That would be a material element, too, would it not?

A. It would.

Q. You were asked in reference to the employment of coke of the New England Coal & Coke Company in Boston for various purposes and you stated that large amounts were sold to locomotives, about 50 per cent., I think, and considerable other amounts for industrial enterprises, factories, &c. Let me ask you whether the coke that is produced by the New England Coal & Coke Company is of the same character as that produced in New York or whether it is denser?

A. It is not the same, and it is denser.

Q. More like anthracite in that regard, is it not, and of better use for those purposes?

6131 A. More like anthracite, so far as its fuel use is concerned, that is to say it can be used in place of anthracite and also in place of what is known as Connellsville coke, it is of the same character as Connellsville coke.

Q. Which would not be true to the same extent, would it, for the coke produced in New York?

A. It would not.

Q. You said coke was used in the suburban service in Boston. As a matter of fact there is a very large suburban service running from the various stations, is there not, in the immediate vicinity of Boston?

A. There is.

Q. Is it not so to a much greater extent than in New York?

A. In Manhattan proper, yes sir, I think so.

Q. You were asked as to Mr. Edgerton's system, and whether you could not get more gas under a high pressure through a small main. Assuming that to be the case, would that be any argument, in your opinion, in favor of taking up and throwing away or disusing your large mains which at present exist?

A. No.

Q. It would not be economical to put in small mains to meet that situation, would it?

A. No, sir.

Q. How about the expense and cost of a high pressure main of any size?

A. Size for size a high pressure main is more expensive than the present main.

Q. Would you not have to use wrought iron mains?

A. Mr. Edgerton, I think, assumed wrought iron mains in his proposition, but if he did not we would have to use wrought iron mains, and I am assuming we would use them.

Q. When you said that the gas mains would be as safe under the pressure as water mains, to what did you refer?

A. Merely the factor of safety on a given type, for a given pressure would be the same whether it was water or air or gas.

6132 Q. Do you mean to say that in case of a break that there would be no more danger in one than in the other?

A. Not for one moment.

Q. You were asked in reference to generators and whether you would not mark off something for depreciation if you knew that they would depreciate and require the replacement of parts. That situation exists the moment you start a new generator, does it not?

A. Yes, sir. As a matter of fact——

Q. And where parts are replaced from time to time with new, or as good as new parts, the generator is as good as ever?

A. Yes, it maintains at least 100 per cent. in value; in my judgment, a generator which has been actually in use is better than one that is starting up in use. As a matter of fact the $2,100 could not have referred properly to a generator. It probably referred to retorts, and, as a matter of fact, retorts are not repaired all at once every three years, but year in and year out, some one year and some the next, so it leaves an even distribution, as a rule of expenses of that nature.

Q. And if there is any depreciation or any requirement for replacement this is not met, I understand it to be your view, from your previous testimony, that a fund should be set aside to meet that.

A. For current renewals and replacements.

Q. And final renewals?

A. Yes, pardon me—for extraordinary renewals and final renewals and replacements, not for current renewals.

Q. You were asked whether or not you would reinstall the 14th Street benches at Astoria and you stated you would not?

A. I did.

Q. Let me turn the question around and let me ask you if you would install the Astoria benches at 14th Street as the situation is now?

A. I would not.

Q. Do you consider it an economical thing to do?

A. We have the 14th Street already in use, and I do not believe in installing the Astoria benches alongside the 14th Street works would reduce the cost of gas, considering the capital in use there and the additional capital required to make the change. 6133

Q. Reference was made to the carry-ng of crude oil in the pipe line. Your understanding is, is it not, that it is refined when it gets to Bayonne, so far as the Standard Oil is concerned?

A. Yes, and those that have pipe lines east, and I understand that crude oil is transferred to the refineries and refined there.

Q. You were asked regarding Williamsport and you added the freight from Williamsport to New York City in order to find what oil would cost here. As a matter of fact Williamsport is about the edge of what is known as the independent field there, is it not, the oil field?

A. I so took it to be.

Q. And if we obtain oil from independents, do you know of any way we could get it without paying in addition to their charge there the freight from Williamsport to New York?

A. I so assumed it, I assume that that was a competitive point and a competitive price.

Q. You found in Garfield's report that the oil fields were competitive points, didn't you?

A. Yes, sir, in general.

Q. So, too, if we were receiving oil from the far West by rail, we would have at least to pay the freight from here to Williamsport?

A. Yes, sir, it would be so much in excess of that from Ohio.

Q. Mr. Chamberlain was brought on to testify as to the cost of oil in Findlay, and you have given that cost plus the freight to Jersey City?

A. Yes, sir.

Q. Do you find in Mr. Garfield's report that Findlay is a competitive point also?

A. I do.

Q. Especially so mentioned, is it not?

A. Yes, sir.

Q. Now, Pennsylvania oil was stated by one of the withnesses to cover Pennsylvania, some part of New York, a few counties
6134 in southeastern Ohio, and some in West Virginia. Is Findlay in the Pennsylvania oil region or in a different region?

A. No, sir, Findlay is in the northern part of Ohio, west of the central line of Ohio, quite well up towards the State line.

Q. That is known as Lima oil?

A. I so understand it. I was there a number of years ago.

Q. You remember that Mr. Carter testified in reference to coal that the coal companies insisted upon presenting their bids and that they would have broken the door down if we tried to keep them out. Has anything come to your knowledge from any source which would lead you to suppose you could get oil from any source in the quantity and at the time you required, and of the same character, at less than you are now paying?

A. No, sir.

Mr. Burr: He may not have all the knowledge upon the subject.

Q. Do you know of any independent refineries this side of Pennsylvania that refine any oil that amounts to anything in quantity?

A. I understand from Mr. Garfield's report there are two very small refineries in the vicinity of New York.

Q. But so far as your information goes, their product does not amount to enough to be of much value to the Consolidated Gas Company, does it?

A. No, sir, the exact amount was not stated, but the way it is spoken of, it is insignificant.

Q. When you spoke of the candle-power tests, you were asked whether those tests were corrected for temperature as you gave them at the works and for the city test; were they?

A. Yes, sir, I investigated that carefully and I find they had been corrected for temperature and pressure and that they were taken from the outlet of the holder from the make of the works
6135 unmixed with other gas, except at 14th Street, where gas of other works is used to enrich the coal gas. May I interpolate a statement right here?

Q. Yes.

A. About that same time Mr. Kirby asked me in regard to whether I was sure that certain figures were corrected gas or whether they were the oil gas. I would like to spread on the record the actual figures for Mr. Kirby's information.

Mr. KIRBY: I would like to have them.

The WITNESS: February, 1905, gas registered, 393,518,000; corrected, 384,604,000; oil gas, 15,400,000. Total, 400,004,000. You will see that Mr. Edgerton used the 400,004,000, which is the total gas, including oil gas, and the figure I gave was corrected by gas. The correction was actually 11,000,000, whereas the oil gas was 15,000,000.

Q. Now, reference was made to Pintsch gas under heavy pressure as being used under conditions of cold with the suggestion that that did not lose candle power. Is that comparable with ordinary gas produced and delivered under ordinary pressures?

A. Not in my judgment.

Q. As a matter of fact, it is subjected to a pressure of 150 or 200 pounds, is it not?

A. Yes, sir.

Q. And what effect has that?

A. A large quantity of the hydrocarbons is deposited on account of the compression of the gas, which of course affects the conditions of the gas. If that gas then were subjected to a change of temperature I think it would be very materially different from the conditions which exist in ordinary illuminating gas.

Q. You stated that in some instances gasolene was added, or naphtha to a low gravity oil to bring it up. In what cases would that be profitably or naturally done?

A. Mr. Mathewson, I do not think I stated that I knew it
6136 was done. I said it might possibly be done that way, but
Mr. Kirby suggested that the high cost of gasolene might make it unprofitable. It might possibly be used for lower gravities, at least it would materially affect the question upon what gravity they were endeavoring to make as to the cost of doing it, and whether it was profitable to do it.

Q. And would you consider an oil of very heavy gravity, say, 25, raised to a certain point by the addition of naphtha of a very high gravity, as producing a desirable oil from your standpoint?

A. I should prefer not to have it raised from any gravity in that way. I should prefer to have one which is more even.

Q. That would be what you would call unhomogeneous if you were to use that expression contrasted to homogeneous oil?

A. That was the way we used it.

Q. There is always some tar in manufacturing water gas, is there not?

A. Yes, sir, always tar produced.

Q. Did you figure how much territory you would desire for your storage tanks in New Jersey if you established a storage capacity for ninety days there, if you cut loose from the Standard Oil contract?

A. We would require in excess of thirty acres, I should say.

Q. In reference to the price of residuals in London, so far as coal tar is concerned, do you know what the price is? You were asked about it and how it compared with New York.

A. I do not recollect the figures that were given there. I think it was rather lower than our price when divided by the number of gallons.

Q. But, as a matter of fact, the coal which is used in London, for instance, is of a very different quality, so far as your informa-
6137 tion goes, from that used in New York, is it not?

A. I am informed so, but I do not know of my own personal knowledge.

Q. And without further information you would not yourself be able to make any comparison, would you, that would be of value?

A. Not in comparing the yield of residuals on the given coal and return.

Q. Now, Mr. Addicks, you took various exhibits, including State's Exhibit HHH and MMM and NNN and OOO, which were prepared by Mr. Edgerton, and made certain deductions from those exhibits, stating what they showed as analyzed and you prepared one for December, 1905, of the 21st Street plant, made up on the same basis. Was your purpose in that connection anything more than to show what the results were from Mr. Edgerton's own method of tabulation himself?

A. That was my purpose, sir.

Q. As a matter of fact would it not be your judgment that a much more intelligible result as to candle power and drops between works and tests could be obtained by taking all the gas of the company for all stations for the year combined and averaging them with the city's tests for the year?

A. Any suggestion of the City Inspector not getting the exact gas that was made at that station—it would eliminate that, if you took the average as Mr. Marks did yesterday.

Q. Precisely.

A. I want to say, however, that the number of tests in each case has a little bearing. That is to say that the tests at the station are in some cases made every hour for the whole twenty-four hours candle power, whereas the city tests are only—I don't remember how many a day, perhaps ten a day.

Q. But your point is that even then it would not be an exact comparison but you would get a general average that would be more nearly the fact than by taking the entire year for all stations and all tests.

6138 A. It seems to me if there is any mixing of the gas that should be done.

Q. Now, for instance the 42nd Street works take the test of their gas as it leaves the station, that is to say works test?

A. Yes.

Q. Now, before that gas reaches the city test station it is sent to another point, is it not, and mixed with other gas in a holder?

A. I don't remember the testimony about that, Mr. Mathewson; I don't recall exactly how it is. If there was, that would have to be considered.

Q. These testing stations, as you understand it, were picked when the companies were separate companies, were they not, representing the mains?

A. I so understand it, one uptown and one downtown, and the two stations are supposed to cover every company in the city, but as to what date they were fixed, I could not state.

Q. In answer to Mr. Burr you referred to the fact that you negotiated the oil contract. Did you ultimately get a lower figure, that is to say, does the contract comprise a lower figure than at first demanded by the Standard Oil Company?

A. I have so testified to it, one-quarter of a cent a gallon.

Q. You stated you tried once buying oil on the outside, in answer to Mr. Burr's question as to whether that was so. Was your experience a pleasant one, and what was the experience?

A. It was not a pleasant one. In Boston we hired a man as an oil buyer, with the understanding that he was to supply us with our necessary oil for our stations, which at that time was naphtha, but after we had burned our bridges we found we could not buy enough naphtha to reach our gas works at any reasonable price, and as a result we had to build new works to handle the heavier grade oil which we had not anticipated using when we started in on the proposition.

6139 Q. In other words, he could not deliver the goods and it was an expensive experiment, was it not?

A. That was the experience that we had at that time.

Q. You were asked whether if fourteen or fifteen companies got oil at 3.65 a gallon, as cited by Mr. Marks, you did not think you ought to get it for less than the present price, and you cited certain circumstances that would govern, but you said nothing about quality. Would not the question of the quality of the oil be a very important circumstance?

A. Yes.

Q. I think you referred to the personal equation, or Mr. Burr referred to the personal equation in reference, if I understood him, to information that you obtained from these other companies. As a matter of fact, the information you obtained was figures, practically all, was it not?

A. Yes, I did not understand Mr. Burr to mean the personal equation in getting the figures, but merely in the management of the work.

The Master: The economical administration of the work.

Mr. Burr: Yes.

Mr. Mathewson: I have nothing more to say on that, then. I misunderstoood him.

Q. You also said in certain streets of the city you thought one line of mains would do. Do I understand that if two lines of mains, say six-inch mains, did exist in the street, it is considered at all economical to discard them and to put down one line of main, even in such streets?

A. No, sir.

Q. I want to refer to the city of Boston for a moment. If the figures which have been shown you are correct, the candle-power for water gas in Boston is stated to be 22.9. As a matter of fact,
6140 no gas of that candle-power is sent out to consumers, is it?
A. No, not in the city proper.

Q. That is mixed with low candle power coal gas to produce an average of 19 candles, as I understand it, or 19.3.

A. So far as I can read that gas commissioner's report, that water gas that is shown is made in three stations, and in one of the three stations coal gas is made and mixed with it, and in another one of the three stations coke oven gas is mixed with it and the testing station is in the center of the city, possibly five miles from each of the three stations, four or five miles. In addition to that coal gas is brought in through a fourth station about a mile and a quarter or a mile and a half from this testing station.

Q. Now, so far as the candle power at the works is concerned for the coal gas and water gas, is not the coal gas tested by an Argand burner, or was it not your experience?

A. Any coal gas enriched with oil or unenriched would be tested by an Argand burner.

Q. What would be the effect of that, to show a higher candle-power or lower candle-power than if tested by the Bray burner, such as is used in New York City?

A. To show a higher candle-power.

Q. So, too, as to water gas, which is stated to be 22.9 candles. With that sort of a burner is that test made, so far as your experience goes?

A. That test is made, as I stated to-day to Mr. Burr, I think, with a Sugg-table top burner which is a burner which has around the lower part of it, just below the slit, a platform which prevents the air coming in quickly to the flame.

Q. And what is the effect of that, to show a higher candle-power or lower candle-power than the Bray burner which is used here?

A. It tends to increase the candle-power.

Q. By how much?

6141 A. By some authorities it is as high as 8 per cent. I can say from my personal knowledge somewhere not less than between half and one candle; 8 per cent. would be 1.6 candles, so it would be somewhere in the limits of probably three-quarters and 1.6 candles.

Q. So on that basis you would suppose that water gas when tested by the New York standard would show substantially lower than 22.9, would it not?

A. That particular gas?

Q. Yes.

A. Yes, but in addition to that the water gas mixed with the coal gas must be the candle-power of the mixed gas as made before it goes into the holder. At the Bay State it would be uncertain as to whether it was as it left the holder or went into the holder.

Q. Now, the Boston result of 4.38 candles per gallon, if those be the correct figures, are also very much below the New York results, are they not?

A. Yes, sir, it is considerably.

Q. Now, regarding your testimony in Boston at the investigation there, regarding which Mr. Burr has questioned you, is it not a fact that you appeared and assumed certain figures of cost which were given you and thereupon made your estimate and tabulations of result, if a dividend of 10 per cent. were allowed and also if a dividend of 8 per cent. were allowed and if 10.5 cents were allowed for a depreciation fund?

A. Yes.

Q. And were not the figures which you gave at that time the exact result of such a computation?

A. They were. I also eliminated certain charges.

Q. Very good, will you state a little more at length, taking the $1.10 which would be the result with 8 per cent., if these other additions which you think proper were made, and see how it figures out at present?

A. I eliminated all returns from electricity and eliminated all the profits on the sales of gas to outside auxiliary companies.

6142 Q. That was the basis upon which the testimony was given, was it not?

A. I gave testimony of that. I had the figures and stated what they were.

Q. It was fully explained in detail so it was perfectly understood what you were testifying at the time?

A. Perfectly.

Q. Now, if you deduct the 10½ cents from $1.10 it would leave 99½ cents, would it not?

A. Yes, sir.

Q. And you did not include, you say, the profit on gas sold to other companies, or the profit on the electric business, which would amount to how many cents per thousand on an output of that time?

A. On the output of that time, based upon what I have already stated, about $170,000, I think it was, and the sales at that time were about three thousand millions, I have not the report before me, which makes nearly 5.7 cents per thousand feet on the sales at that time.

Q. And if you take 5.7 from 99 cents it would leave about 94 cents?

A. It would leave 93.8 cents, and according to my figure here the average price of gas paid by private consumers in the year referred to, ending June 30, 1906, was 92.15 cents. There is a difference of 1.65 cents in the two computations.

Q. Which might have been made up, assuming the figures were to exactly balance, by a difference in operating expense or something of that sort?

A. As the effect of consolidation and as modified by increase of sales to private consumers.

Q. As a matter of fact, was 8 per cent. paid or has it been paid on an 85 cent basis, or even on a 90 cent basis of sales?

A. It has not.

Q. What was the average?

A. The sales to private consumers—when I say paid, I mean to private consumers, the average price of gas paid by private consumers—the memorandum I have here, obtained from Mr. Richards, was 92.15 cents per thousand.

6143 Q. In this 92.15 per thousand you testified that the Boston Company did not include the depreciation allowance of 10½ cents?

A. No, sir, they did not.

Q. Nor the profits from the electric business nor gas sold to other companies?

A. You mean in my computations?

Q. Yes.

A. No, sir.

Q. Now, even at the price at which they did sell, from the accountant's report as published in the press and to which reference has been made, they did not earn even the 8 per cent. dividend, did they, if you deduct a profit on the sales of gas to other companies and the electric, and if you deduct depreciation at the rate of 5 cents a thousand, which Mr. Richards testified should be done?

A. They did not earn it if you deduct either of those, and certainly not if both be deducted.

Q. And if you deducted them both there would be a substantial shortage?

A. Yes, sir.

Mr. Burr: Are the amounts stated in that newspaper clipping?

Mr. Mathewson: Yes, they are. It is not a newspaper clipping except that it is a publication required by the statute of Massachusetts.

Q. The assets of the Boston Company, according to the report to which your attention has been called, amount to something like $24,000,000, do they not?

A. Yes, sir.

Q. As against a capital stock of a little over $15,000,000 and some notes outstanding of not a large amount in addition, is that right?

A. Yes.

Q. There are several million dollars surplus, at any rate, over capital and capital obligations in assets?

A. Yes.

6144 Q. So the entire investment in electric business could be treated as surplus beyond all the capital outstanding of the company, in whatever form?

A. If they so desired to figure it.

Q. Now, in view of the fact that Mr. Burr has gone into this subject at such a length and spoken of the earnings and dividends——

Mr. Burr: Of what company?

Mr. Mathewson: Of the Boston Company.

Q. (Continuing:) I will ask you what your information is as to the earnings on the reduction to 85 cents per thousand?

Mr. **Burr**: I object to that. We were simply meeting the statements he had made.

Mr. **Mathewson**: No, you were not. You went into it head over heels this morning.

Mr. **Burr**: And which you brought out through his examination in rebuttal.

Mr. **Mathewson**: I think you have opened it so that I at least can ask this question.

The **Master**: I will allow it, Mr. Burr.

Mr. **Burr**: Exception.

A. Mr. Richards' statement to the Tax Commissioners in Boston was that the net earnings since reduction in price was last made indicates that the company for the year ending June 30th will not be able to pay over 6 per cent., if it does that, for the fiscal year ending June 30, 1907.

Q. And if you eliminate the earnings from electrical business, assuming that they are 4.6 cents per thousand, the earnings would not be over five per cent., would they?

A. You would have to reduce that by the 1.1.

Q. That would be less than five per cent.?

A. I think the calculation this morning would be 4.9, and under it. Mr. Mathewson, you understand that is the entire amount

6145 of the sales to other companies, as well as the electricity?

Q. Yes; in other words, the entire profits of the company from whatever source, so far as you know?

A. Well, I eliminate the sales to other companies and the electricity—in that $170,000 which you mentioned.

Q. Yes, I understand——

A. In other words, based right on the gas business in Boston and not on some outside business.

Q. Now, Mr. Burr asked if gas in summer would not pick up enrichment, or might not puick up enrichment as it went along through the mains. If it could do that, wouldn't it necessarily follow that the enrichment must have been dropped in the winter or some other time in order that it might be picked up later?

A. Yes, sir.

Q. One is a corollary of the other?

A. If one could be done——if it was to be picked up.

Q. As a matter of fact the ten and one-half cents which you deducted in Boston was for depreciation and reserve fund, final renewals, pure and simple, without including any renewals there had been, wasn't it?

A. That was in addition to the expenditures for repairs during the current year, yes, sir.

Q. You were asked whether if when we had the Astoria plant running we would require more oil, and I did not understand your reply to be exactly definite. If we use Astoria to produce the three billion feet which we are now procuring from other companies and continue to run our own manufactories on Manhattan Island, it would certainly mean more oil required.

A. For the Consolida-ed Gas Company, yes, sir.

Q. Your answer I assume referred to the proposition of our completing a second unit which would be substituted for something on Manhattan Island later?

A. I was assuming that the whole situation was the whole
6146 hundred million gallons, all the companies, when I answered
that question, and if some coal gas would be made instead of
some water gas.

Q. As far as the Consolidated is concerned, you cannot see any reason, can you, for supposing we would require less oil in the near future?

A. Not so long as the candle power exists as now.

Q. Now, as a matter of fact, isn't the English law which Mr. Burr has presented and which shows no penalty for half a candle power and some penalty for twenty-five pounds to one hundred pounds, or a later drop, a law that has been superseded by a subsequent act?

A. I am so informed.

Q. And the London Gas Act of 1905, which I show you, provides, does it not, that the penalty shall attach only in case there is deficiency in candle power existing of one candle instead of half a candle?

A. (No answer.)

Q. And that then the average of all testings——

Mr. Burr: He has not answered that question. I would like to know about it.

Mr. Mathewson: You shall know. Here is the act. Paragraph 3 on page A2, I think it is, states:

"If on any one day the gas supplied by the company at any testing place is of less illuminating power to an extent not exceeding one candle than it ought to be the average of all the testings made at such testing place on that day and on the preceding day and on the following day shall be deemed to represent the illuminating power of the gas on such one day at such testing place."

Q. Yes, that was all. Then they take the average of all the test-
ings of that day combined and the average of all the testings
6147 for the day before and the day after to arrive at the candle
power in determining the question of the imposition of the
penalty; that is it in substance?

A. That seems to be the force of it. And it also I see here states that:

"The gas supplied by the South Metropolitan Gas Company and the Commercial Gas Company shall be 14 sperm candles of six to the pound."

My opinion is that a difference of one candle in a 14 candle power gas is a very different proposition from the difference of one candle in a 22 candle power gas.

Q. And you find also that the company has a right of appeal, don't you, by that act, in case they do not think that the imposition of the penalty is proper?

The Master: They had that under the old act, didn't they, to the chief inspector?

Mr. **Burr**: Yes.

Mr. **Mathewson**: The rights of appeal are very much broader in this act, Mr. Master.

The **Witness** (reading): "If the company think themselves aggrieved by any prescription or certificate of the gas referees they may, in the case of an appeal, in respect of a burner or a chimney prescribed by the gas referees under the provisions of this act, within three months, or in any other case, within one month from the making of such prescription or certificate, appeal against such prescription or certificate to the chief gas examiner."

In our law there is no provision even that the best burner should be used.

Mr. **Mathewson**: This act, I will say, is known as the
6148 London Gas Act, 1905 (5 Edw. VII., Chapter 155).

Recross-examination by Mr. **Burr**:

Q. With regard to the figures that were supplied to you at the Boston examination, were these the same figures that are contained in this clipping from the *Boston Globe* of September 28, 1906, to which reference has been made?

A. No, sir, but the figures supplied to me were very similar; I have checked them.

Q. This purports to be the audit covering the company's books, June 15, 1905, to the close of the fiscal year, June 30, 1906?

A. Yes, I told you it was more than one year.

Q. You stated that the figures for the Boston company, by Mr. Chase, as auditor, did not agree with those in the State return. You are now aware, are you not, that Mr. Chase's audit was from June 15, 1905, the date of consolidation, to June 30, 1906, while the State return was for the year commencing twelve months from June 30, 1905?

A. Did I state they were not alike?

Q. I think so.

A. Didn't I state they were alike? My impression is I have checked some of these figures and they are undoubtedly the gas commission's report. There are some figures that are identical, therefore, I assume the gas commission must have covered more than one year.

Q. Referring to the statement you just made, with regard to the possible increase or non-increase of oil supply, by reason of the Astoria works, if the make of the Astoria works in coal gas for 1907 and 1908 is 15,000,000,000 cubic feet and each cubic foot of gas required two gallons of oil to enrich to 25 candles at the works, will
not the total of your requirement for oil be 30,000,000 in-
6149 stead of 107,000,000 gallons of oil?

A. Astoria to make 15,000,000,000 feet.

Mr. **Mathewson**: The total capacity of the first unit is only 4,000,000,000.

Mr. **Burr**: We are speaking now of the future.

Mr. **Mathewson**: You say this year?

Mr. **Burr**: I say 1907 and 1908.

The WITNESS: That is nearly four times the capacity of the first unit.

Q. Well, that will be true when you get a capacity of 15,000,000,000 cubic feet, which is the capacity which you calculate to finally arrive at?

A. Why, I have not made any statement of that kind, except in so far that the first unit will be four thousand millions and each unit that we had would be that much, if the ultimate capacity of the Astoria plant in coal gas is 120,000,000 a day, and if we had four units, I might have said it was sixteen thousand millions with four units, but I don't see any connection with 1907.

Mr. MATHEWSON: The testimony expressly was that it was not determined whether the subsequent units would be water gas or coal gas. We couldn't tell that.

Q. Assuming the make of the Astoria works of coal gas will finally arrive at fifteen billion feet, then you will not need 107,000,000 gallons, but only 30,000,000, assuming two gallons per thousand cubic feet of gas enriched to the 25 candle-power point?

A. Multiplying the fifteen billion feet by two gallons is thirty million gallons of oil, but that has no reference to our requirements.

Q. The figures upon which you based your statement in the Boston gas investigation were supplied to you by the company, were they not?

A. Yes, sir.

6150 Recross-examination by Mr. KIRBY:

Q. It does not require as much oil to enrich coal gas to 22 candlepower as it does to enrich carburreted water gas, does it?

A. No, sir.

Q. As a matter of fact if you add a gallon of gas oil to a thousand cubic feet of carburetted water gas there is no enrichment, is there?

A. I can't answer that question. I should think there would be some but I don't recall doing that.

Q. If you added two gallons would there be any appreciable result in candle power?

A. I don't recall the figures given by others, and I do not remember myself having added either as low as one or two gallons to water gas to determine the candle power.

Q. Now, if you add a gallon after two have already been added, you will have the candle power raised more than the gallon—more than that occasioned by adding the second gallon, will you not?

A. I think very probably as you state it for that number of gallons, yes.

Q. That would be true up to how many gallons per thousand cubic feet of carburetted water gas?

A. I think with the present oil you would get the higher candle power up to between twenty and twenty-five. I think it will probably proceed in the opposite direction and require more proportionately for the net result in higher candle powers.

Q. And that would commence before you reached twenty-five candles?

A. I think it would come more in the vicinity of twenty-two to twenty-five probably, but I wouldn't want to be specifically tied down to that as a specific statement of facts.

Q. You are not sure of that point where the maximum result from one gallon of oil to a thousand cubic feet of gas is thirty-five candles, and not twenty-five?

A. You mean with the present oil?

Q. Yes, such oil as the Consolidated is now using?

6151 A. My judgment and experience would be to say it was below twenty-five rather than anywhere near thirty-five, with our present oil.

Q. Would a lower gravity oil make the point nearer 35?

A. I think it would be more difficult with gravity oil to make the higher candle out of it than if you had the higher. You are speaking now of 30 and 35? I mean netting that.

Q. Are we to infer by that that the maximum of a low gravity oil would be at a higher candle power than the maximum from a high gravity oil?

A. No, I think the reverse of that. That is how I am trying to place it.

Q. Well, that is what I thought. Do you know whether the coke furnished by the New England Coal & Coke Company has any higher percentage of carbon than that furnished by the Consolidated Gas Company works on the Island of Manhattan?

A. Pound for pound?

Q. Pound for pound?

A. I would not like to say whether it had or not.

Q. Do you know whether it differs at all in ash, pound for pound?

A. I would not commit myself on that either.

Q. Do you mean to say that if there were no works upon the 14th Street real estate of the Consolidated Gas Company and you were called upon to place a coal gas plant upon that you would place there the kind and size of benches or retorts that are now there rather than those which have been placed at Astoria?

A. I do not.

Q. Your information in reference to the oil used at the gas works at Williamsport was that such oil was purchased from the Standard Oil Company, was it not?

A. That was in the evidence originally.

Q. And such information as you received did nothing to contradict that, did it?

A. No, sir, it did not.

6152 Q. Do you know what candle power the Pintsch gas which you referred to has?

A. Before or after using?

Q. As it is used in the cars?

A. No, sir. I meant to say before or after compression.

Q. I mean after the compression, ready for use?

A. No, sir. I don't know definitely.

Q. Do you know what candle power it has before compression?

A. Well, from general knowledge of what oil gas is usually.

Q. What would that be?

A. It depends somewhat on how many feet of gas you make with the oil. If you make more feet of gas you are apt to have a low candle power when made in the retort process. If you make less gas you would have a higher candle power.

Q. Do you know how much candle-power is lost by compression?

A. No, Mr. Kirby, I won't say I have never known; I probably have known in reading, but I haven't it in mind and could not testify and give you the information about it.

Q. You have spoken about the coal gas being tested by the Argand burner. When is it tested by an Argand burner, do you know?

A. Well, the supply of air to the gas produces the highest incandescence in the hydro-carbons in that particular kind of gas, in that particular shaped burner, with a particular number of holes.

Q. So there would be more candle-power shown by a test with this burner than if tested with a Bray burner?

A. With the ordinary flat frame burner, or even the Bray burner, yes, sir, in my judgment.

Q. Is that also true of the Sugg table top burner that you have made reference to?

A. Yes, sir. I think the Argand burner gives a better result than the Sugg table top for the lower candle-power coal gases.

Q. Would the Sugg table top show more candles than the Bray burner on gas below 16 candle-power?

6153 A. I don't recall that, but I should think it would; but I don't think in the same proportion, if at all.

Q. Would it show it on gases below 20 candle-power?

A. Yes, I think it would be apt to.

Q. Would it on gases below 22 candle-power?

A. I think on the higher candle powers it would show probably the results that I have set up. As you go down to lower ones I don't think the results would be in the same proportions.

Q. Do I understand you, then, that the Sugg table top burner would give a higher candle-power than the Bray burner, such as is used in the city's tests here in New York, on the same gas, such gas being 22 candle-power or above?

A. That is my opinion, yes.

Q. The Sugg table top burner is in use in the city tests, isn't it?

A. I don't know of it being used, no, sir. It is used in Boston, I stated. It was used by me at the Boston works.

Q. Is the Sugg table top burner the burner used by the Consolidated Gas Company?

A. No, sir. We use the same burner as the city, which, as I recall it, is the Bray No. 7, I think I stated the day before yesterday it was Bray No. 6. I would like to correct that now. I think it is No. 7.

Q. There is no requirement you know of in the statute applying the test of candle-power which specifies that the Sugg table top burner should not be used, is there?

A. I won't be sure about the present law, but the former law said tests should be, as I recall by a burner that was in general use, from my memory of the wording of it. As a Sugg table top I do not think is in use in New York, it would be excluded, I should think.

Q. Have you ever made any tests on the Sugg table top as compared with the Bray burner?

A. Yes, I did; a great many years ago.

6154 Q. On what candle-power gas?

A. 25 candle-power.

Q. Do you remember the results of your tests?

A. No, except it was adopted in preference to that burner as giving the better results. Under the Massachusetts law it was that the burner should be used that gave the best results; it was used for that reason.

Q. Was that enriched coal gas or enriched carburetted water gas?

A. That was carburetted water gas.

Q. Are you not aware that the Sugg table top burner was made for the purpose of testing the low candle-power gas used in the City of London?

A. I didn't know that it was intended for that purpose. I only know its result as used on high candle-power in Boston.

Redirect examination by Mr. Mathewson:

Q. Dense coke is not so bulky as porous coke, I suppose?

A. It is not, sir, ton for ton.

Q. Therefore, where you have restricted room, for instance, as in the tender of a locomotive, the dense coke is better adapted for use there?

A. It is; and, in general, it will stand the blast of the locomotive and would stay in the fire where the draught through the tubes of the locomotive might draw the lighter coke up through the tubes and make more of the cinders in the front end which you are familiar with.

Q. Referring to other Massachusetts companies outside of Boston, it would make a distinct difference whether in that test they used table top burners or Argand burners in making their tests as reported, would it not?

A. It would depend upon the gas they made; yes, sir.

6155 Alfred E. Forstall, a witness called on behalf of complainant, in rebuttal, being first duly sworn, testifies as follows:

Direct examination by Mr. Mathewson:

Q. Where do you reside?

A. Montclair, New Jersey. My business office is in New York City.

Q. What is your business?

A. Consulting gas engineer.

Q. How long have you been such?

A. Since 1899.

Q. Have you had any practical experience in the gas business?

A. Quite a good deal. Shall I give you an account of it?

Q. Yes.

A. After graduating with a degree of Mechanical Engineer from Lehigh University, Class of 1883, and taking a post graduate course of a year in chemistry, I went to work with the Chicago Gas Light and Coke Company, which was one of the companies now merged into the People's Gas Light and Coke Company of Chicago, as superintendent of construction. I was then made assistant manager of the North station works of that company, in charge of the operation of the water gas plant. Upon the death of the manager I was made manager of the station for a year. Later, upon the death of the engineer, I was made assistant engineer in charge of both stations. I left that company in 1890, came to Newark, where I was general superintendent of the Newark Gas Light Company until 1897, when I went to Montclair and was general manager of the Montclair Gas and Water Company, which made no gas but bought it and distributed it, for two years, and then I became a consulting engineer.

Q. Have you had experience and practice in photometry and investigations of candle power and pressure?

6156 A. I have made a very thorough study of photometry as part of my work as manager of a gas works.

Q. Did you take State's Exhibits X, Y, Z and AA, being four burners, which were presented here by Professor Hallock, and make tests of the rate of consumption, candle power of flame and efficiency under the pressures as to each which Professor Hallock employed?

A. I did.

Q. And do these sheets which I present show the results of your tests as to those four burners respectively?

A. They do.

Q. And in the final column and under "Remarks" I find such entries as "Flame of good shape and stiffness" or "Horns at base of flame almost horizontal." Those remarks indicate the character of the flame, I assume?

A. Based upon my observation at the time of making the tests, yes, sir.

Q. Do these sheets contain tests at any pressure in any case other than those employed by Professor Hallock?

A. They do in the case of the last sheet.

Q. That is referring to State's Exhibit AA?

A. Yes; but not otherwise.

Mr. Mathewson: I will offer these in evidence. They are in the same form as Professor Hallock's, and made so for the purpose of comparison.

Received in evidence, and marked Complainant's Exhibits 336, 337, 338 and 339.

Q. As a rule, Mr. Forstall, these tests as to rate of consumption, candle-power, and efficiency candle-power per foot, agree very closely with Professor Hallock's, do they not?

A. In general they do. There is a little difference in connection with State's Exhibit X and State's Exhibit Z, in that my tests do not show the efficiency to fall off as fast, in the case of State's
6157 Exhibit X, with the change in pressure from .4 to .6 of an inch, as Professor Hallock's did, and State's Exhibit Z from

.14 to .21 of an inch, my efficiency does not fall off as fast as the efficiency determined by Professor Hallock did.

Q. Professor Hallock stated in the case of the Welsbach that the efficiency dropped off when the pressure fell below 1½ inch, and you made no tests in that regard?

A. No, sir.

Q. State's Exhibit AA is the same as State's Exhibit Z, except that the former is checked?

A. Exhibit AA is checked.

Q. And did you make tests with a high pressure Bray Slit Union No. 6 burner, which was similar to State's Exhibit X, except that the high pressure Bray was checked?

A. I did.

Q. So, too, did you make experiments with a high pressure Bray Slit Union No. 4, which was similar to State's Exhibit Y, except that this high pressure Bray also was checked?

A. I did.

Q. And the results of those tests, as compared with State's Exhibit Z and State's Exhibit AA and State's Exhibit X are shown in tabulated form on this sheet?

A. They are.

Mr. Mathewson: I offer this sheet in evidence.

Received in evidence and marked Compainant's Exhibit 340.

Q. Referring to these five sheets, Complainant's Exhibits 336 to 340, both inclusive, I wish to call your attention to some other features. Is it not the fact that when the efficiency begins to drop there is a noticeable difference in the appearance of the flame which calls the attention of the consumer to the necessity of adjustment?

A. It is.

Q. And how is that change evidenced?

A. If you will look in the "Remarks" on Complainant's Exhibit 336, the first page——

6158 Q. That is the commercial 6-foot bat-wing lava tip burner?

A. Yes, you will see opposite the data for .6 pressure the statement that the flame shows horns at base of flame and streaks in the blue portion, and is just on the point of becoming serrated on the upper edge. When you come to the .7 pressure you find horns becoming quite prominent, blue portions streaked and the upper edge serrated. It is just at that point that the efficiency drops, when those horns appear it shows the efficiency is beginning to drop.

Q. A very slight drop then in efficiency beyond the point where the flame is of good shape and stiffness is at once shown in the character of the flame.

A. The shape of the flame and its character.

Q. I call your attention to Professor Hallock's action in removing the checks from the burner in order to obtain more light, even though it involved loss of efficiency according to his tables, and ask you whether that is wise or necessary in the use of gas according to your tests and experience?

A. Very unwise and entirely unnecessary. If he wanted more light he could have obtained it with the same efficiency by getting a larger sized check burner which would have given him the same efficiency, and he could have gotten a size to suit any amount of light he wanted.

Q. Take Complainant's Exhibit 340, the fifth sheet of these, where we have a comparison of the checked and unchecked burners. I observe that State's Exhibit Z, the unchecked burner, with a pressure of .14 inches—which is its highest efficiency, is it not?

A. According to Professor Hallock, and which agrees approximately with my test, yes.

Q. (Continuing.) Gives an efficiency candle power per foot of 4.43 candles; is that right?

A. Yes, sir.

Q. That same burner, except that it is checked, to wit, State's Exhibit AA, with a pressure of one inch, gives an efficiency of
6159 how much?

A. 4.46 candle per foot.

Q. So that the high pressure of gas instead of being uneconomical would seem to be economical in that case, wouldn't it?

A. If the burner was properly designed to it, yes.

Q. So too, take State's Exhibit X, under the pressure of .4 of an inch, it gives an efficiency of 4.14, and what does it give if checked under a pressure of 1.29 inches?

A. 4.52 candles.

Q. There is another substantial advance in efficiency?

A. Yes.

Q. So, too, State's Exhibit Y, unchecked, under pressure of .4 inch assumed by Mr. Hallock, gives an efficiency of 4.17 candles, and if checked it gives what efficiency at a pressure of 1.33 inches?

A. The checked burner similar to it gave an efficiency of 4.28 candle.

Q. So that these high-pressure burners, or the checked burners you employed, gave them, with a pressure as high as 1.3 inches, or even higher, a greater efficiency than can be obtained by the low pressure burners even under the most economical pressure for the low-pressure burner?

A. They may be employed at considerably higher pressures than that. I stopped there because the particular photometer I was workign on would not give me any more pressure—the governor on the photometer would not give me any more pressure than that—but I could have run either of those two burners up to two inches without showing any drop in efficiency.

Q. That is your general experience from other tests and observation?

A. From other tests, yes, sir.

Q. If one desires to use a low pressure burner and one less
6160 efficient, therefore, than the checked burner, he may regulate the amount of gas and the character of his flame by turning down his burner when he sees it flare?

A. He certainly can do just what I do every night in my hall. I have a burner there which I have not changed, because I adjust the flame by the stop cock.

Q. If he does not care to do that he can have the higher pressure burners?

A. Yes, sir.

Q. Have you any photographs here which you want to show me?

A. Yes, sir. I have photographs of the flames given by these burners, illustrating some of the points which I testified to.

Q. Now, as to State's Exhibit X, is this a photograph taken with the flame at a pressure of .8 inch?

A. It is. The pressure is shown on the gauge at the side, a low-pressure burner, unchecked.

Q. Does that mean to show by the character of the flame that it should be turned lower?

A. Yes. The horns are very decided and the upper edges becoming rough and the flame is beginning to have sharp angles instead of a curve.

Mr. MATHEWSON: I offer this photograph in evidence.

Received in evidence and marked Complainant's Exhibit 341.

The WITNESS: That pressure is the point at which the efficiency showed a decided drop.

Q. Now, State's Exhibit Z is shown in the photograph I now hand you at its highest point of efficiency, as per Professor Hallock, at .14 of an inch, isn't it?

A. Yes, sir.

Q. And the character of that flame simply shows it is being burned at an economical rate, doesn't it?

A. Yes, sir. This photograph also shows that that flame
6161 is entirely too small to be of much service to anybody and
that it is very flabby; the edges are curved back so the flame
is like that instead of being flat (illustrating).

Q. And do you find that some of these results of Professor Hallock were obtained with a flame so flabby that while it might do in the laboratory it would be out of question for commercial use?

A. Yes, sir. I think you will find that noted in the remark on these.

Mr. MATHEWSON: I offer this photograph in evidence.

Received in evidence and marked Complainant's Exhibit 342.

Q. I also show you another photograph. This represents State's Exhibit Z, a low pressure burner, a pressure of .2 inch, does it not?

A. It does.

Q. And what does it show as to the size of the flame and the character of it?

A. By comparing it with the other parts in the photograph it can be seen that that flame is very small and also seen it is curled over on the edge and flabby and not such as would be commercially used.

Mr. MATHEWSON: I offer that photograph in evidence.

Received in evidence and marked Complainant's Exhibit 343.

Q. I show you a photograph showing upon the same paper two exhibits, one State's Exhibit AA?

A. Yes.

Q. A checked burner, is it not?

A. Yes, sir.

Q. And the other State's Exhibit Z, which is an unchecked burner; is that right?

A. Yes, sir.

Q. This is under pressure of 1.35 inches, is it not?

A. Yes, sir.

6162 Q. What comments have you to make as to the character of those flames and what they indicate?

A. The checked burner is giving a good flame; the unchecked burner, you can almost tell from the picture, is making a noise, and giving a flame that gives very little light. The flame is pointed and you can see the streaks in it, showing the blue streaks running all through the flame. It was making so much noise that nobody would use it in the room.

Mr. Mathewson: I offer that photograph in evidence.

Received in evidence and marked Complainant's Exhibit No. 344.

Q. The unchecked burner, State's Exhibit Z, is "blowing," isn't it, as it is called?

A. Making a noise, roaring; yes, sir. I will state that I took no candle power test of State's Exhibit Z when it was in that condition, because it was simply useless. You find on Complainant's Exhibit 338 that I took no candle power tests at pressures of .62 and .97 of an inch, although Professor Hallock had taken tests at those pressures. As soon as I saw the flame I made up my mind there was no use taking any candle power of that gas, because it was not a flame that would be used.

Q. Professor Hallock in speaking about the use of gas for fuel did not say that the practical efficiency of gas was the same, no matter at what pressure the gas was supplied to the burner; his statement being in this regard at page 3868, merely that he had made tests showing that the actual calorific value of the gas was the same at different pressures?

A. That is as I read the testimony and as I understand it.

Q. In his cross-examination, page 3890, he said the tests were made with the Junker Calorimeter. Does that show efficiency or merely the total calorific value?

A. Merely shows the total calorific value.

6163 Q. Then the general proposition, as I understand it, without going into details, which you consider to be established by these details, is that the higher efficiency and the greater economy to the consumer can be obtained by burning the gas under pressure of more than an inch, even in the ordinary burner, if it is checked?

A. I wouldn't say greater, but as great. If the ordinary burner is properly checked the efficiency will be about the same.

Q. And those checked burners are burners, are they not, which are in common use and can be obtained at any time in the city from the company and which it distributes, as you know?

A. The burners are on hand at the company's office, as I understand it; or, if the consumer does not care to go to the company they can be very easily obtained at several places in the city.

Q. For a small sum?

A. About 5 to 10 cents. I never bought them at retail. At wholesale I can get them considerably cheaper than 5 cents.

Q. On page 3093 of the testimony Professor Bemis made the statement that "If then the Consolidated Gas Company can stand a reduction to 85 cents on the basis of last year's business it could stand a reduction to 75 cents on the basis of the business that would surely come to it in the next two years after the reduction." And again, on pages 3408 and 3409, he gave an explanation of this statement, using concrete figures. Will you review that theory with your figures and state your conclusions as to the soundness of his deductions?

A. In order to test that I proceeded to check, by a method which I use continually when I am estimating the amount of gas that would be sold in a town, on the gas company of which I am reporting the reasonableness of sales, of the amount of gas that would be required to make these statements accurate, and in order to determine
6164 the amount of gas that would have to be sold at 80 cents,
taking the second statement first, to produce under these assumptions a profit of $3,288,000, which is the profit assumed by Professor Bemis, I first divided that amount of money by the sales of gas in 1905, and determined that the profit per thousand cubic feet necessary under those conditions was 24.75 cents. Assuming the same cost of gas the profit at 80 cents would be only 14.75 cents per thousand cubic feet, or to have a total profit of $3,288,000 it would be necessary to sell 22,291,525 thousands of cubic feet.

Q. That would be 22 billion- and over?

A. Yes. Sales of that amount would mean an increase between 1905 and 1908, 1908 being the second year after the reduction, if it were made immediately, of 67.5 per cent. Now the per cent. increase of sales is very misleading sometimes, that is, when you attempt to go from the past to the future. Simply on a percentage basis you are very apt to get into trouble, so using the method that I employ to see what that would mean in this way, I took a consumption per active meter December 31st 1904, as taken from Complainant's Exhibit No. 86, which was 35,227 cubic feet and divided it into 22,291,525,000 cubic feet and so found that to sell that amount of gas the company would have to have, December 31st, 1908, 632,796 active meters, which would be an increase over the number in use or the number of active meters December 31st, 1905, of 242,466 meters. This number of 632,796 active meters would mean one meter for the Consolidated Company for every 3.59 inhabitants in Manhattan in the year 1908. Assuming that the other companies on the island——

By the **Master**:

Q. Your population being estimated on what?

6165 A. I estimated the population by taking the difference
between the population as shown by the State Census of 1905 and the population as shown by the United States Census of 1900, and assumed that the increase for the years between 1905 and 1908 would be at the same absolute number per year as in that five years

between 1900 and 1905, and that brought out a population for 1908 of 2,270,257. Assuming that the other companies operating in Manhattan in 1908 had 200,000 active meters the total number of active meters in Manhattan would be 832,796, which would give one meter per 2.72 inhabitants. To see what this meant in regard to the number of families in the Island of Manhattan at that time, or rather to see how the increase in the meters compared with the increase in number of families, I divided the increase in population, which was roughly 156,000, three times 52,000 and some odd hundreds, by 4.72, which is the number of persons per family given for the Island of Manhattan in the United States Census of 1900, and found that there would be an increase of practically 33,400 families in the three years, or only 1-7 the increase in Consolidated meters that would be required to meet the increase of sales.

By Mr. Mathewson:

Q. So there would be an increase of meters of 289,955, against an increase in families of 33,400?

A. 242,466 was the increase in meters as against 33,400 in families, yes, sir.

Q. Now taking the other comparison?

A. I had no cost of gas given and so for the sake of getting something that had authority behind it outside of the company's statement, I took the cost of gas given by the Gas Commission, which is
62.56 cents per thousand cubic feet. With this cost the
6166 profit at a price of 85 cents would be 22.44 cents per thousand cubic feet, which on sales of 13,283,000,000 cubic feet,
leaving out the odd thousands from the sales of 1905, would be $2,980,705. Making this total profit at a price of 75 cents or with a profit of 12.44 cents per thousand feet it would be necessary to sell 23,946,000,000 cubic feet in 1908. On the same basis of sales per active meter this would call for 679,672 meters to be set December 31st, 1908, which would give the Consolidated Company one active meter for each 3.34 inhabitants in Manhattan at that time, and making the same assumption as to the 200,000 active meters for the other companies the combined companies would show one meter for each 2.58 inhabitants, or nearly two for each family.

Q. In the whole Island of Manhattan, two meters for each family in the whole Island?

A. In the whole Island, yes, sir. And these figures would call for an increase of 289,955 meters as against an increase in families as previously noted of 33,400.

Q. Now, based on your experience and knowledge of the gas companies is such a thing humanly possible, in your judgment?

A. I think it is entirely impossible.

Q. You never heard of any such proportion anywhere did you?

A. Well, in something like fifty companies I have examined in the last few years I don't know of any case where there has been as much as one to six inhabitants.

Q. And New York City has already passed that and got under that lowest minimum, hasn't it?

A. Yes, sir.

Mr. Kirby: If that is testimony rather than a brief I should certainly like a little opportunity to endeavor to digest it before I should attempt to cross-examine him.

6167 Mr. Mathewson: You can take the sheet; it is right before you, and it is not very difficult to understand it.

Q. How did you get the number of meters for the other companies, on what basis did you assume that?

A. I could not find any definite information which was already on file. It was not in evidence in the case, and not having access to the records of the other companies, I went at it in this way. On page 2283 of the testimony Mr. Marks gives the sales of the Consolidated Gas Company for the year 1905 as being 68 per cent. of the total sales in Manhattan. Assuming that the other companies had the same sales per meter as the Consolidated, which, if anything, is a little low; that is, the other companies would probably have a little higher sales per meter, then, dividing 390,330, which is the number of Consolidated active meters, by .68 would give a total of 574,014 active meters for all companies, or 183,684 for the other companies apart from the Consolidated. To correct for any over estimate there I took 10 per cent. off or 18,000 meters, making the total active meters for 1905 for the other companies of 165,000. Then if there was to be any such increase for the Consolidated meters as would be required by the conditions assumed by Professor Bemis, there would certainly be an increase of 35,000 in the meters of the other companies, so I considered 200,000 was, if anything, too low an estimate for what they would have under those conditions in 1908.

Q. These deductions are based entirely on the figures that have been presented you, as you have stated your computations from them?

A. Exactly. All the figures I have taken are taken entirely from the figures in the testimony. The deduction is, as I say, following out a line of checking that I always use in making up my own reports, as to possible increase in consumption.

6168 Cross-examination by Mr. Kirby:

Q. In this statement which you have made I presume you assumed that the meters registered the same number of cubic feet of gas for the year 1908 as they would for the year 1905?

A. All the figures in this case are for 1905, as I understand it, and I estimated the meters would register whatever gas passed through them, but I have estimated that the sales per meter would be exactly the same in 1908 that they were in 1904.

Q. So that if, as a matter of fact, the sales per meter were larger the number of meters as calculated by you would be much more smaller?

A. Certainly.

Q. And smaller in exact ratio to the increase of sales per meter?

A. Yes, sir.

Q. So again your deductions as to the number of thousands of cubic feet of gas which would have to be sold to bring the profit which you have assumed, depends entirely upon what the cost of making and distributing that gas would be?

A. Certainly.

Q. If the cost of making and distributing that gas would be 80 cents, why couldn't you sell enough gas to make that profit?

A. There wouldn't be any profit at all, no, sir.

Q. Why, you could very well show by a curve or a scale of some kind how the scales would have to increase, as the cost of making and distributing would vary from 80 to 70 to 60 to 50 to 40 or whatever it might be?

A. Certainly.

Q. Now, turning to these tests which you have made on various burners, I take it that in your exhibits 336, 337, 338, 339 and 340, where you state at the top thereof, "State's Exhibit X," you refer to the exhibit which was the actual metal burner with the lava tip or whatever kind of tip might happen to be inserted therein?

A. I do.

6169 Q. And the words, "Commercial six-foot bat-wing lava tip burner," are those corresponding with State's Exhibit CC?

A. Yes, sir.

Q. And that you have assumed from the testimony for instance in Exhibit 336, that State's Exhibit X was in fact the commercial six-foot bat-wing lava-tipped burner with which Professor Hallock made his tests?

A. No, the tag with which the burner was marked, the tags on the exhibits (I haven't in the photograph of State's Exhibit X, but the tags are all the same. Excuse me, here is one with X.) You will see that the tags give both the exhibit number and the type of the burner; that is what I went by.

Q. Do you know how many check burners are in use in the Borough of Manhattan to-day, or the City of New York?

A. No, sir.

Q. Do you know how many unchecked burners are in use?

A. No, sir.

Q. Do you know what percentage of unchecked burners there are, compared to all the burners in use?

A. No, sir.

Q. Do you know what percentage the checked burners bear to all the burners in use?

A. No, sir.

Q. Do you know how one compares with the other so far as the number in use is concerned?

A. I do not.

Q. You have spoken of this burner which you have in your hall, and which you turn down because it is too much trouble to go out and get another one. Don't you think that a man with a check burner that gets clogged up would be put to some trouble to go out and get another one to replace his burner?

A. I never knew a check burner to get blocked up any more readily than an ordinary burner.

Q. Don't they all get clogged up?

A. That depends on the gas a good deal.

Q. In New York City?

A. I don't know.

6170 Q. Do they get clogged up in part? Do they need cleaning or taking care of?

A. Any burner needs taking care of, yes.

Q. How do you take care of them?

A. I usually carry a burner cleaner around with me, but I haven't one now.

Q. You think the ordinary householder carries a burner cleaner around with him?

A. No, but the gas companies distribute burner cleaners very frequently.

Q. Do you know of anybody who can produce one on demand?

Mr. Mathewson: How does that affect a checked rather than an unchecked burner? It seems to me that is rather immaterial.

Mr. Kirby: I don't think so.

Q. Do you?

A. No. But you will remember that I stated that the checked burners did not stop up any more than the unchecked.

Q. They are apt to stop up, aren't they?

A. Most burners have a tendency to stop up.

Q. And when they stop up they are not as efficient as when they are not stopped up?

A. No.

Q. And they flare and do all sorts of things?

A. They are apt to. A checked burner won't flare; an unchecked burner will.

Q. A checked burner when it flares will very often do some of the very things shown in Complainant's Exhibit 341, won't it?

A. I never saw one do that.

Q. It will go off on one side and flare up in the middle and not be regular in form?

A. I never saw a checked burner act that way.

Q. Did you ever see an unchecked burner act that way?

A. I have.

Q. What does a checked burner do when it gets stopped up?

A. Why, it flares to a certain extent, but not as much as 6171 the unchecked burners, because the check in the burner prevents the pressure of gas under the tip from being as high as it is in the unchecked burner.

Q. Have you made your tests as shown on these Exhibits 336 to 339 inclusive in the same manner and with the same kind of apparatus as that used by Professor Hallock?

A. As nearly as I could understand his description, yes, sir; I tried to use the same apparatus that he did, or rather similar apparatus.

Q. I mean similar design and in the same manner?

A. Yes, sir.

Q. Now, I show you a picture here (handing paper) the lower part of which is supposed to represent a gas jet and the upper part thereof the flame. Written in the bottom thereof are the words "Non-Luminous." Is that the way the great majority of flames from gas burners in this city appear to you?

A. Well, I do not claim to have any acquaintance with the appearance of gas burners in this city. I do not live here and spend comparatively no time at all here, and the time I do spend is on streets that have electric light and not gas.

Q. Now, you have said that you consider the check burner is as efficient over one inch as at those points below one inch indicated by Professor Hallock?

A. I beg pardon?

Q. That the check burner is as efficient with pressures of over one inch as at any pressure below one inch?

A. No, I did not say that.

Q. Then what did you say?

A. I think what you refer to is that I said that the check burner was as efficient above one inch as the unchecked burners were at the lower pressure used by Professor Hallock in his test.

Q. State's Exhibit Y was a commercial four foot bat-wing lava-tipped burner, is that a burner in general use, or don't you know?

6172 A. It is a burner that is used quite frequently, yes, sir.

Q. State's Exhibit X was a commercial six-foot bat-wing lava-tipped gas burner, is that a burner generally in use?

A. I think it is used a good deal.

Q. By your statement that a check burner under pressures of more than one inch is as efficient as the unchecked burners used by Professor Hallock in his experiments at pressures under one inch, did you have any limit above one inch pressure?

A. Yes, I would not like to use that particular burner that I used in making these tests above three inches.

Q. You have no tests here, have you, of how that burner would behave at such a pressure?

A. No, sir. The governor on the photometer that I was using refused to give me more than 1.33 inches pressure.

Q. You could have gone to higher pressures with your experiment by removing that governor, could you not?

A. And having another one put on. I could have gone a little higher, but in that particular locality I was working from street mains in which it is very difficult to get over two inches pressure at any time without a governor at all.

Q. Where were these tests made?

A. No. 4 Irving Place.

Q. In the office of the Consolidated Gas Company?

A. Yes, sir.

Q. And you took your gas right from the main?

A. Right from the main.

Q. What sort of a governor did you use?

A. It was a wet balance governor.

Q. You did not draw your gas off into a tank and take your gas at that point?

A. No.

Q. Did you test the gas from time to time as you made your experiments to ascertain the composition thereof?

A. Not to ascertain the composition, no.

6173 Q. It might have been a different mixture at one period of your experiments than at another, might it not?

A. Well, as my experiments only ran over—yes, it might have been.

Q. What standard did you use to test the gas?

A. Candles.

Q. Did you check these candles against any other standard?

A. No, sir.

Q. Where did you obtain them?

A. They were candles furnished by the Consolidated Gas Company or bought by the Consolidated Gas Company for use in making their tests.

Q. And they were turned over to them by you?

A. I got them out of the boxes in which they were bought.

Q. Did you make corrections for temperature?

A. You will see it stated that the candle power was not corrected for temperature and pressure; Professor Hallock did not correct it and so I did not.

Mr. Kirby: That is all.

The Master: Mr. Burr?

Mr. Burr: It is five o'clock.

Mr. Mathewson: Mr. Forstall has an engagement in Philadelphia to-morrow, and I should like to finish with him.

Mr. Burr: I could not, I have had no opportunity to confer with Dr. Marks or Professor Bemis.

Mr. Mathewson: We are not responsible for their not being here, and I object to stopping at this point.

Mr. Burr: I could not finish with him to-night anyway. I do not think it is fair to crowd the mourners anyway. It is five minutes after five, and he has made a very extended review of all these figures and suddenly projected them into this case, and we ought to 6174 have at least a moment's breathing time to look them over. We ordinarily adjourn at five o'clock and it is now five minutes after five.

The Master: All of that is true, but at the same time I made Mr. Mathewson go on with your witnesses when there were reams of tabulations and so forth put in. Of course, you are not entitled to any time for conference with your experts, but the question of its being after five o'clock cannot be denied. What time do you have to be in Philadelphia?

The Witness: I want to be there at ten o'clock.

The Master: Well, you will have to stay here.

Mr. Burr: He can come the next day for cross-examination.

Mr. Mathewson: No, I think it is better to have it consecutive.

The Master: I want to go on at half past 10 to-morrow, gentlemen, as there is a possibility, in fact, there is a very strong probability, that I will have to be in the Appellate Division. I do not know when my case will be on, but if I have to be there at the opening of court I want to leave here before 1 o'clock, so we will go on at 10:30.

At 5:05 P. M. adjourned to Friday, January 25th, 1907, at 10:30 A. M.

Last Exhibits:

Complainant's Exhibit, 344.
State's Exhibit, 000.
City's Exhibit, 236.

6175 United States of America,
Southern District of New York, ss:

I, John A Shields, Clerk of the Circuit Court of the United States of America, for the Southern District of New York, in the Second Circuit, do hereby Certify that the foregoing (Vol. 8) pages, numbered from 5409 to 6174 inclusive, contain a true and complete transcript of the record and proceedings had in said Court, in the cause entitled Consolidated Gas Company, Complainant, Appellee, against Julius M. Mayer, as Attorney General, *et al.*, Defendants-Appellants, as the same remain of record and on file in my office. (Vol. 8.)

In Testimony Whereof, I have caused the seal of the said Court to be hereunto affixed, at the City of New York, in the Southern District of New York, in the Second Circuit, this 15th day of May, in the year of our Lord One Thousand Nine Hundred and eight and of the Independence of the said United States the One Hundred and thirty-second.

[Seal of U. S. Circuit Court, South. Dist. New York.]

JOHN A. SHIELDS, *Clerk.*

[Endorsed:] United States Circuit Court of Appeals for the Second Circuit. —— —— vs. —— ——. Transcript of Record from the Circuit Court of the United States for the Southern District of New York.

6175½ Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucian L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, *January* 25, 1907.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby, Mr. Page.

U. S. Circuit Court, Southern District N. Y. Filed Jun- 24, 1907. John A. Shields, Clerk.

6176 Alfred E. Forstall, resumed.

By Mr. Burr:

Q. You do not contend for a moment, do you, that this calamity of two meters to a small family will happen if the price is reduced to the C' y of New York to 75 cents?
A. I have not the slightest idea it will happen under any conditions.
Q. In other words, your calculation regarding the number of meters necessary would not apply to the city as the sole consumer entitled to the reduction to 75 cents.
A. The calculation, as I understand it, does not affect the reduction to 75 cents at all; it is merely a calculation as to the reasonableness of a certain statement given in the evidence.
Mr. Mathewson: By Professor Bemis.
Q. That is an assumption on the part of Professor Bemis. You set up his hypothesis to knock it down.
A. He set it up and I tried to knock it down.
Q. But you have not confined yourself to what the accountants Marwick, Mitchell & Co. found from the books of the company to be the cost of the manufacture and distribution of gas?
A. No.
Q. And you have made no calculation on that basis?
A. No.
Q. Now, for 1905 you claim a profit on one dollar gas of 24¾ cents per thousand, don't you?
A. No, I said on the figures introduced by Professor Bemis, that he assumed there was a profit of that amount.

Q. That is the assumption that you have adopted for the purpose of your reasoning, for the purpose of your calculation?

A. That is the assumption that I found there and on which I proceeded to work.

Q. It would make the cost of gas about 77¼ cents, assuming that the testimony is correct here, that in 1905 the Consolidated Gas Company received $1.02 per thousand cubic feet? 6177

A. Yes.

Q. Now, Marwick, Mitchell & Co., in Exhibit 87, figured the cost of gas from the books of the company at 52½ cents per thousand. Do you recall that?

Mr. **Mathewson**: No, they did not. That 52½ cents is not on anything, sales, make or anything else; it is a mongrel figure and is not computed on sales. It does not purport to be.

Mr. **Burr**: That is your characterization of the figure, but that is what they claim they find to be the actual cost of the manufacture and distribution of a thousand feet of gas.

Mr. **Mathewson**: Per what, per thousand made or per thousand sold?

Mr. **Burr**: The report shows what they state.

Mr. **Mathewson**: There is absolutely no quantity dividing or divided to produce that amount, but go ahead.

The **Master**: Well, ask your question on the basis of an assumption that it does so appear from their report.

Q. Assuming that the price, 52½ cents, found by Messrs. Marwick, Mitchell & Co. in their report as the cost of manufacture and distribution of a thousand cubic feet of gas is correct, would not the gross gas manufacturing profits for 1905 amount to $6,575,085?

A. I would have to—what return for gas are you assuming there, Mr. Burr?

Q. 52½ cents.

A. That is the cost, but the return to the company for the gas sold, the price of gas? The price of gas is really one dollar.

Mr. **Mathewson**: Mr. Bemis' assumption, on which the witness is testifying, was the sale at 85 cents.

6178 Mr. **Burr**: I am still sticking to the $1.02.

Mr. **Mathewson**: That has nothing to do with the testimony this witness has given. He has taken Professor Bemis' figures and figured out what the result would be.

Mr. **Burr**: I am asking about some other figures now.

Mr. **Mathewson**: I do not think it is proper to take up that figure which has no relation to what the witness testified to.

Mr. **Burr**: You want to figure and stick to those figures and I want to do a little more figuring.

Mr. **Mathewson**: No, of course, if you have thirteen billion feet of gas and assume it cost 52½ cents and you sell it for $1.02 it is simply two times two equals four to assume what the profits will be, but it has nothing to do with his testimony. He has assumed a selling price of 85 cents, which Professor Bemis did, and showed that Professor Bemis's statements were ridiculous on that assumption.

Mr. Burr: I object to all this criticism of the testimony.

The Master: Let us go ahead. If the question is objected to I will pass upon it.

Q. (Repeated as follows:) Assuming that the price 52½ cents found by Messrs. Marwick, Mitchell & Company in their report as to cost of manufacture and distribution of a thousand feet of gas is correct, would not the gross gas manufacturing profits for 1905 amount to $6,575,085? Is not that so, Mr. Forstall?

Mr. Mathewson: I object to that as not cross-examination, and
furthermore as the counsel himself will recall, if he will think
6179 a moment, in getting the 52½ cents Messrs. Marwick, Mitchell & Company deducted the miscellaneous income which made the difference between that and $1.02.

Mr. Burr: I call your attention to the report of Marwick, Mitchell & Company as it appears at page 1431, final conclusion:

"First, we find that the total cost of manufacturing and distributing the gas sold to private consumers in the City of New York by the Consolidated Gas Company during the year 1905 was 52.04 cents per thousand cubic feet. This cost includes a charge for depreciation of 1.71 per thousand cubic feet, the same as made by the company in its accounts."

And I am addressing myself to that situation and asking him to do some figuring on what was actually found and not based on any assumption or hypothesis of Professor Bemis. It is very easy——

Mr. Mathewson: But the 52.50 was obtained by deducting from the 1.02 the miscellaneous income which went to make that up, and now you are asking us to take an amount which has that miscellaneous income and deduct it from an amount from which it is deducted——

The Master: He may answer it if he can. The objection goes not so much to the form of the question, but as to the merits of the case.

The Witness: If I can make the computation——

Q. That is what you did yesterday.

A. I do not get exactly those figures——

Mr. Mathewson: Just a minute, has the Master ruled on my objection as to the propriety of such a question as that?

The Master: Yes, I allowed the question.

Mr. Mathewson: Exception.

6180 Q. What did you make it?

A. I used the multiplier 13,283,164 and get the result 6,575,166.

Q. Now, you do not assume to say what the cost of gas is or was?

A. I have not investigated that question at all.

Q. So that you do not assert that the cost of gas was or is 77¼ cents per thousand?

A. No, sir.

Q. Well, that would be the result, Mr. Forstall, if you subtracted the 24¾ cents from the $1.02, would it not?

Mr. Mathewson: Just a moment. What is the use of asking that kind of a question when Mr. Forstall's entire testimony was directed to Professor Bemis' proposition, if you sold the gas at 85 cents you would get a certain price? Now, he says if you get $1.02 would you not get a certain other. Of course you would. It is wasting time.

The Master: I do not know what counsel has in mind, but I will let him ask a question or two on this line. I do not myself see the pertinence of it. It seems to me it is a matter of argument on brief.

Mr. Burr: That is what we claimed yesterday as to the whole of Mr. Forstall's testimony, that it was a matter of brief. And Mr. Kirby objected to it very properly at the time.

Q. Now, the profit, Mr. Forstall, of $4,588,000 appearing on Exhibit 96, page 382, net earnings as it is called there, net profits, is nothing but what the Consolidated Gas Company calls its net profits, and not its manufacturing profit on gas as figured from the examination of Marwick, Mitchell & Company.

Mr. Mathewson: What that is is shown by the exhibit.

6181 The Witness: I do not know what it is. I have never seen that exhibit. I would have to examine it and see before I could say, and I might not be able to say then.

Q. It is so stated——

The Master: Then, if it is so stated, that ends it. There is no use of asking this witness about it.

Q. Then the difference between the $6,575,085 and $4,588,000 is $1,987,000, profits on gas manufactured and elsewhere expended.

Mr. Mathewson: I don't know about elsewhere expended.

A. It gives a difference of that amount. I don't know what the difference represents further than it is the difference between those two sets of figures.

Q. If we add this $1,987,000 to the reduced net profits, $3,288,000, granted by Professor Bemis, we have a total gross profit of $5,275,000, have we not?

A. We have a total of $5,275,000, yes, sir.

Q. If the price of gas is reduced to 80 cents per thousand and the cost is allowed to remain as high as 52½ cents, will not the profit per thousand be 27½ cents?

Mr. Mathewson: Well, your witnesses went over that and over that and said yes, it would be.

A. If the cost is reduced——

Mr. Mathewson: If the cost of gas should be 52½ cents——

6182 Q. I will repeat my own question. If the price of gas is reduced to 80 cents per thousand and the cost is allowed to remain as high as 52½ cents, will not the profit be 27½ cents?

A. The difference between 80 cents and 52½ cents is 27½ cents.

Q. If we divide the gross manufacturing profit of $5,275,000, as deduced in those figures I have given you, the sum of $1,987,000 and the reduced net profits, $3,288,000, I say if we divide the gross manufacturing profit of $5,275,000 by 27½ cents, does it not give a total sale of 19,182,000,000 cubic feet to about 68 per cent of your population for 1908, or 2,270,257 for Manhattan?

Mr. MATHEWSON: Now, if the Master please, this so-called manufacturing profit of $5,275,000 is obtained by taking the one dollar rate and computing what the profits are for the past year. Now, the witness is asked to take that amount and assume a situation at which 80 cents would be charged, which, of course, would not give the same profit, and deduce Heaven knows what; I cannot follow it.

The MASTER: Well, let him answer it, and we will see where it will land him.

A. What was the question again?

Q. (Repeated.)

Mr. MATHEWSON: 68 per cent. of the population?

Mr. BURR: He gave the population of the Borough of Manhattan as 2,270,257.

The MASTER: I thought the Consolidated sales were 68 per cent. of the entire sales in Manhattan?

Mr. BURR: Yes; and 68 per cent. of the population is 1,543,775.

Mr. MATHEWSON: I don't know how you can divide it in that way.

6183 The WITNESS: Dividing of 5,275,000 by .275 the quotient is 19,182,000,000—it is 19,182,800,000, which is practically the same.

Q. You gave the population of Manhattan in 1908 as 2,270,257, didn't you?

A. That was the estimate, yes, sir.

Q. And 68 per cent. of that would be 1,543,775, would it not?

Mr. MATHEWSON: If it would, what would that show? We never claimed that we were serving 68 per cent. of the population of New York, and it is not our testimony anyway, even as to any 68 per cent.

The MASTER: Well, Mr. Mathewson, I will allow the question., I want to let Mr. Burr go on a reasonable length of time and see if I can get at what he is trying to reach in regard to the testimony of the witness yesterday, as to this question of meters, and I cannot tell until he gets further along whether he does or does not arrive at any result.

The WITNESS: 68 per cent. of 2,270,257 is 1,543,775.

Q. Now, if you divide that figure of 1,543,775 into 19,182,000,000 cubic feet you obtain 12,425 cubic feet per capita, don't you?

The MASTER: Let me ask you, Mr. Burr, is the result of the examination of this witness going to be to impeach the correctness of the calculation the witness gave yesterday in any respect?

Mr. BURR: Yes, I think so.

The MASTER: In what respect? Because I cannot see now what it is leading to on the question of attacking his direct examination.

6184 Mr. BURR: I have but three or four questions more. They are all part and parcel of each other, but I will read you all the questions I have here, if you wish.

The **Master**: In other words, what do you show to be wrong in regard to this calculation of the number of meters on the basis he took here?

Mr. **Burr**: We claim that he errs in the percentage of the increase of the number of meters that will be used..

The **Master**: I understand, but he figured on a certain assumed price of gas and on a certain assumed cost of gas, and as I understand your question, you are putting to him an entirely different price of gas and an entirely different cost of gas. You are figuring on one dollar gas and 52½ cents cost, and he was figuring on 52.50 cost and on 85-cent gas. I do not see if you continue this indefinitely that you will get at anything which impeaches the correctness of his calculation, and that is the only province of cross-examination.

Mr. **Burr**: As we said yesterday, it was a mere calculation, but you allowed him to make a calculation and it leads to an apparent absurdity.

The **Master**: He was allowed to make it because he claimed to show his calculation an error in Professor Bemis' calculation. Now, I will allow you to show the same thing on cross-examination as to what he has done, but what I do not perceive now is where you are going to arrive, if you proceed along the lines you are now pursuing.

Mr. **Burr**: Can I get the answer to the question?

The **Master**: Have you got the calculation?

6185 The **Witness**: I do not remember the figure that was given, and before I check over my figures I want to see whether it agrees or not.

Q. (Repeated as follows:) Now, if you divide that figure of 1,543,775 into 19,182,000,000 cubic feet you obtain 12,425 cubic feet per capita, do you not?

A. That is the result of the division.

Q. From your experience, Mr. Forstall, as you have stated it yesterday, in the gas business, is it not true that the construction of apartment houses in New York will be likely to force a greatly increased use of gas for cooking and heating?

A. No, as far as the increase is concerned——

Q. You do not know, or no?

A. I say no. I would like to explain that if I can.

Q. Yes, please.

A. I think that the construction of apartment houses has already brought about a very large sale of gas in New York City, and that the increase that will come from the construction of apartment houses in the future, the increase in the sales of gas that will come from the construction of apartment houses in future, will be merely in proportion to the number of apartment houses built, which would be approximately in proportion to the population.

Q. Then you do not believe, as a gas engineer, that the use of gas as fuel is on the increase?

A. As a general proposition, yes, it is on the increase. As a special proposition for New York City, I think it has about reached its limit per capita of population.

Q. As a matter of fact, would you not say that the use of gas for fuel and power is on the increase?

A. I do not think there is much increase in the use of gas for power. That is, the percentage increase of the gas used for power may be pretty large, but the increase in proportion to the total amount of gas sold is very small.

6186 Q. But you know the testimony in this case of Messrs. Addicks and Humphreys is that the per capita consumption of gas is about 9,200 feet in New York?

A. Yes, sir, I have heard that testimony.

Q. That was with gas at one dollar?

A. Yes, sir.

Mr. Burr: Well, I will not press this further in view of the Master's attitude. I thought that I might ask him to make a calculation based upon other evidence in this case.

The Master: I think the brief is the place for that.

Mr. Burr: I think so, too, and I think his whole statement as given yesterday should be incorporated in the form of a brief.

Mr. Mathewson: Professor Bemis had nothing but the figures presented and did not pretend to know anything about the gas business, and he spent days going over those figures and making deductions. What is the use——

The Master: Go on with the rest. What else do you wish to ask him?

Mr. Burr: That is all.

Mr. Kirby: I would like to ask the witness a few more questions. I was rather limited yesterday.

By Mr. Kirby:

Q. Complainant's Exhibit 339, showing photometric tests with the commercial fishtail burner No. 5, checked; is it not a fact that such burner shows a greater efficiency with one inch pressure than with 1.18 pressure?

A. Yes.

Q. You stated yesterday that you took your pressure readings at what point of the burner?

A. For all burners the pressure was taken directly at the base of the burner itself, and for unchecked burners that necessarily

6187 gave the pressure at the tip; for checked burners it gave the pressure on the inlet side of the check.

Q. Were any pressures taken by you between the check and the tip?

A. No, sir.

Q. You also stated that you used a governor to regulate the pressure as given to the burner. Do you consider that the pressure and consumption was in any way restricted by the use of that governor?

A. No. The pressure was cut down a little by the friction of the gas passing through the governor. What was the other part of the question?

Q. The consumption.

A. The consumption was not cut down, because I set the governor to give the pressure that I wanted to use.

Q. Does the governor itself in its measurements regulate for the friction of gas passing through it?

A. The governor is provided for the purpose of maintaining an even pressure from its outlet, from which the gas is supplied to the burner, so that the amount of gas consumed will not be constantly varying from second to second, making your flame give different amounts of light from second to second or minute to minute, that is the only effect that it has.

Q. What kind of a burner did you use in ascertaining the candle power of the gas as set down in the bottom of each exhibit?

A. I used a burner that Dr. Love, the City Gas Examiner, has very often told me that he used, a No. 7 low pressure Bray slit union; and another reason for using that was that Professor Hallock said that he used it.

Q. And did you measure the candle power of each gas with this burner before performing your experiments?

A. For each series of tests, if they extended over any great length of time, that is over, say, three hours, I took the candle power of the gas that I was using at the beginning of the series, and as the very last thing at the end of a series.

6188 Q. And what pressure did you use in the test for the candle power of the gas?

A. Why, I did not make a note of that, Mr. Kirby, but my recollection is it was somewhere between .55 and .6 of an inch.

Q. And where did you take that pressure?

A. That was behind the check in the burner. In making the test I adjusted the governor to burn at the rate of 5 cubic feet per hour in that burner, or practically at that rate. In some tests I may have got .02 of a foot above or below. In making the tests I followed the practice of Dr. Love with which I am familiar, and also which I understood to be Professor Hallock's practice, based upon Dr. Love's.

Mr. Mathewson: What burner was that you just referred to?

The Witness: It does not show in this exhibit. It is a burner I took the candle power with, the figures for candle power being given in these exhibits.

Q. Now, if your pressure had been taken between the check and the tip it would have indicated a different pressure than that taken by you, would it not?

A. It would, yes.

Q. And would that pressure have been higher or lower?

A. I would naturally expect it to be lower.

Q. And that is because the check cuts down the pressure?

A. Yes.

Q. Now, do you consider that with a pressure at the street main of say three inches, or, better, say at the point where the gas enters the house meter, a pressure at that point of three inches, that the pressure at the point of ignition in a check burner might rise as high as 6.2 inches?

A. That would be a matter of speculation. I would not have any idea as to how high it would rise.

Q. Do you consider that the reduction of the cost of electric currents to 10 cents per kilowatt hour has sent many customers who formerly used gas to the use of electricity? 6189

Mr. Mathewson: Is that a proper question?

Mr. Kirby: I should think it was very proper, inasmuch as he has been making certain deductions as to what would happen in the future based upon his experience and knowledge of the gas business.

Mr. Mathewson: He rather testified as to what could not possibly happen, which was Professor Bemis' result, rather than what could happen in electricity or anything else. I shall not object if you wish to push the question.

A. I should expect a reduction in price in any rival illuminant to take away from the gas company a certain number of consumers. The exact number or percentage it is very hard to say.

Q. And would you not think that the converse of that proposition would be true?

A. That if the price of electricity was increased it would add consumers to the gas company?

Q. Yes.

A. If the price of any competing illuminant is increased it makes it easier for the gas company to substitute gas for that illuminant.

Q. Then does it follow from that that if the price of gas be reduced to 80 cents that the customers in whole or in part who have turned over to electric current at 10 cents per kilowatt hour would come back to the use of gas at 80 cents?

A. Why, they might in part, yes; possibly.

Q. You nor no one else is prepared to state as to how many?

A. No. I am prepared to say, though, that even at $1.00 the cost of gas properly used is pretty well below the cost of electricity, and the part of the population who consider economy and the price of gas would keep gas at $1.00, and, therefore, would not come to it at 80 cents; they would be there at $1.00. 6190

Q. And if, by reason of persuasive powers of the electric light company, they turned to the use of electricity they would be much more apt to come back to the use of gas at 80 cents than they would at $1.00?

A. They would not be as apt to come back as they would be apt not to have listened to the offers of the solicitors. After they have changed over they are not as apt to come back.

Q. In reference to meters, many families have two, three or even four meters to the family, have they not? One for the residence, one for the store, another for the factory, and some have them for the lighting of their residences and another meter for the heating?

A. I should not think that would—the use of a meter for the lighting and the use of another for heating would not obtain in New York City. Of course, there are cases where a man has a meter in his residence and a meter in his store, and possibly—well, he might have, possibly, a further meter in his factory, but that would be very, very rare.

Q. It would be all the same family?

A. Yes.

Q. Is it not a fact that in many apartment houses in the city the rent of the apartment includes the lighting of it, but not gas for cooking?

A. I don't know, Mr. Kirby.

Q. If that were so it would necessitate two meters, would it not?

A. If the apartment were lighted with gas, it would.

Q. We are assuming that. Are you not aware that in Glasgow, Scotland, there are nearly two meters to the family at a price of gas not much less than in New York?

A. I was not aware of it, but they do some queer things in municipal plants.

6191 Mr. Kirby: That is all, I think.

Mr. Burr: Just one question.

By Mr. Burr:

Q. You have assumed in your calculation, have you not, that a meter will not register any more gas in 1908 than it did in 1905?

A. Yes; as I answered that question yesterday I said that I had assumed that the sales of gas per meter would not be any larger in 1908 than they were in 1905.

Q. But you do not mean to say that those meters now in existence would not, in the event of a reduction in price, be able to consume and register more gas?

Mr. Mathewson: What do you mean? Do you mean to say that the meters could be so constructed that for 1,000 feet of gas they would register 1,500 feet?

Mr. Burr: No.

Mr. Mathewson: What is the use of the question?

Mr. Burr: He says on the basis of the consumption per year of 35,227 feet per active meter——

Q. You do not mean to be understood as saying that a meter cannot register more than that?

A. Allow me to correct that. I think you said that was the consumption in 1905. My impression is that the sales per meter in 1905 were not that amount, but that was the sale per meter in 1904.

Q. So that you have used in your calculation the number of feet registered by your meter in 1904?

A. I think it is 1904; that Exhibit 86 would show.

Q. You refer to the exhibit I see, Exhibit 86?

A. I can tell in a minute; I have it right here in my notebook. Yes, that was for the year 1904.

6192 Q. Do you know what the Consolidated Gas Company's gas meters registered in 1888?

A. No.

Q. Have you got Exhibit 86 here?

A. No, I have just some few figures I had copied.

Q. I call your attention to Exhibit 86, and ask you if it does not appear from that complainant's Exhibit 86 that in 1888 the average sales per meter of the active meters of the Consolidated Gas Company were 39,731 feet?

A. It does.

Q. During the gas war, 1898 to 1900, did not the meters increase to 58,344?

A. I would like to see the exhibit.

Q. Or 29,172 feet per year, with gas at 82.85 cents average?

Mr. Mathewson: 29,000 feet a year? No such thing.

Q. In 1898, from this complainant's Exhibit 86, it appears that the active meters on district in 1898 was 253,816, and in 1899, 289,357?

A. Yes.

Q. And in 1900, 311,960?

A. Yes, sir.

Q. That was the period during which the so-called gas war continued?

A. I have it so marked in my notebook.

Q. From 1900 to 1905 have not your meters increased 78,370, or only 15,674 per year, with gas at a dollar, referring to the same exhibit?

A. Yes.

Q. Or only 15,674 per year with gas at one dollar?

A. Yes.

Q. Since 1898 to 1905, has not the registry of meters increased from 29,000 to 34,000 cubic feet?

A. I think in 1898 the figures were 28,800 and some odd feet, I have not the exact figures; and in 1905 they were 34,000 and some odd feet.

Q. You heard Mr. Addicks testify that there will be an increase of 10 per cent.?

A. No, I did not hear Mr. Addicks' testimony except a few fragments of it, five minutes at a time.

6193 Q. Now, Mr. Addicks has allowed for an increase in oil of 10 per cent. in the amount of oil required; that would mean more than an allowance of 10 per cent. increased water gas, would it not?

Mr. Mathewson: I shall have to object to this. It seems to me that we are going entirely outside of anything that was suggested, even by name, with this witness.

Mr. Burr: We are still harping on the meters. We have this important fact that he has been assuming in 1908 that the consumption of gas stood still and that the registry of gas has stood still since 1904, and upon that he is basing his calculations as to the number of meters which will be required in 1908.

Mr. Mathewson: The witness has not made any such assumption as you suggest, and if he had, the matter of oil would not affect the question.

Mr. Burr: He has said, that being so, there would be a certain number of meters needed at that time. I am going to ask if he will figure on Mr. Addicks' increase of 10 per cent., without taking anything else into consideration, would not this reduce the number of meters required by 209,568, leaving only 34,998 new meters to be added in three years, or 11,666 per year, which figure is not excessive.

Mr. Mathewson: Mr. Addicks has not testified to any such thing. He testified that he gave 10 per cent. in order to get a large figure which would surely cover it; that he thought it would more than cover it when he ordered them.

Mr. Burr: I say, assuming his 10 per cent., does it not follow as I have stated this question that I have asked Mr. Forstall?

6194 Mr. Mathewson: It has no relation to it.

The Master: I do not see what the oil has to do with it.

Mr. Burr: Assuming a 10 per cent. in the increase of oil, it increases the gas.

The Master: The supply of oil increases 10 per cent. each year over the preceding year?

Mr. Burr: There is an increase in the supply of oil of 10 per cent. which must necessarily mean an increase in the production of gas of 10 per cent.

Mr. Mathewson: It does not, anything of the sort, because here we have coal gas and we might increase coal gas and make less water gas, and use less oil, as Mr. Addicks testified. The question virtually is this, if the increase of gas would be 10 per cent., what about the number of meters you would require, that is the question, if anything.

Mr. Burr: If you object to the statement that it was Mr. Addick's testimony, I will say, assuming it is stated.

Q. Assuming the increase of 10 per cent. in the consumption of gas, would not this reduce the number of extra meters by 209,468, leaving only 34,998 new meters to be added in three years?

Mr. Mathewson: You mean 10 per cent. a year in the output of gas, or 10 per cent. all told for the three years?

Mr. Burr: Just let the witness answer, if he understands the question.

Mr. Mathewson: No, but I would like to understand the question, and I think I am entitled to.

Mr. Burr: What do you want to know?

6195 Mr. Mathewson: Whether the ten per cent. is the increase you assumed to cover the three years or per annum?

Mr. Burr: Ten per cent. per annum.

The Master: That is what I wanted to know, whether you mean the consumption of oil was assumed to be ten per cent. more in any one year than in the preceding year; in other words, whether in the period of three years the total consumption of oil would have increased thirty odd per cent.

Mr. Burr: Yes. As I understood Mr. Addicks he said that for 1908 it will have increased ten per cent.

Mr. Mathewson: No, he did not testify to that at all.

Q. Well, leaving Mr. Addicks out of the case altogether, if we can, and assuming an increase in the consumption of gas of ten per cent.

in 1908, would that reduce the number of extra meters required by 209,468?

A. I thought I understood the question at first, but you have mixed me up. You mean that the sales of gas in 1908 would be ten per cent. greater that the sales in 1905?

Q. Yes, that they have increased ten per cent. a year since 1905.

A. That is they would be thirty per cent. greater in 1908 than in 1905?

A. Yes.

A. My answer is no.

Q. How do you know you could have obtained the same efficiency with gas having a two-inch pressure, as with gas having less than one inch if your photometer could not register a test above 1.33, by reason of the governor?

A. Because my experience with those burners has taught me for pressures up to 2½ inches at the base of the burner they are all right, their efficiency changes very little.

6196 Q. How can you assume efficiency at pressures which cannot be registered on a photometer?

A. I was not estimating efficiencies as a result of that test, but as the result of my previous experience.

By Mr. **Mathewson**:

Q. With photometers that would register higher pressure?

A. Yes.

Mr. **Burr**: That is all.

Redirect examination by Mr. **Mathewson**:

Q. Referring to Exhibit 86, as a matter of fact it appears, does it not, taking the whole period altogether, that in 1885, 1886, 1887, 1888, etc., the company sold from thirty-six to thirty-eight or thirty-nine thousand feet per active meter and that that has fallen in the year 1905 to thirty-four thousand and thirty-one feet per meter?

A. That is so.

Q. In other words, the consumption per meter has fallen?

A. Yes.

Mr. **Burr**: Do you know the cause?

Mr. **Mathewson**: Yes.

The **Witness**: It has not only fallen from in the 80's to 1905, but it has fallen considerably from 1904 to 1905.

Q. And is it not your experience that with the increase of consumption and the getting in of the small consumers that the decrease per meter does naturally follow?

A. Yes, the increase in sales after a certain point is reached is bound to come from getting in of small consumers.

Q. And, therefore, more expensive per consumer to the company.

Mr. **Burr**: I would rather you would ask the witness to give his own facts upon it. You have been continually putting words in the mouth of this witness and in the mouths of every other witness. 6197

The **Witness**: Certain expenses depend entirely upon the consumer and upon the amount of gas that he burns, and a small consumer is necessarily more expensive in proportion to the company than a large one.

Q. Where you have two kinds of gas, both fuel at one price and one quality, and illuminating gas of another price and another quality, there might be two meters in a house for that purpose, might there not?

A. Yes, there are.

Q. But you are speaking of New York conditions?

A. I am speaking of New York conditions.

Q. And is not the same kind of gas delivered in New York, so far as you know?

A. The same gas and at the same price.

Q. You do not know whether they furnish different qualities of gas in Glasgow for illuminating and fuel, do you?

A. I don't know anything about the Glasgow conditions.

Q. You were asked with reference to the effect of electric light on the sales of gas. What would be the effect if the electric light appliances were to be improved so as to make three times the efficiency at the same cost?

A. It would necessarily reduce the cost of electric light to one-third of its present cost and by so doing make it a very much more effective competitor of gas than it is at present.

Q. Do you know whether there are such appliances now in use?

Mr. Kirby: I object.

Mr. Burr: I understand Mr. Forstall did not claim to be an electric light expert?

Mr. Mathewson: No, he does not, that I know of.

6198 Q. If you say you don't know I suppose there is no objection to that?

Mr. Kirby: He can go on, if he does not know, but if he does know I would——

Mr. Mathewson: You don't want him to go on if he does know?

Mr. Kirby: I would rather state it myself.

Q. I will take your answer over the objection.

A. I think it is a matter of common knowledge among lighting or illuminating engineers that there are several lamps on the market which cut down the current per candle power to something like one-half of the requirements of the ordinary carbon filament lamp. The General Electric Company are putting out what they call the tantalum lamp, for instance.

Mr. Kirby: I understand this goes in over my objection.

The Master: I did not understand the ground of the objection.

Mr. Kirby: On the ground it is not proper rebuttal, mainly.

The Master: It is proper redirect on the cross-examination, surely.

Mr. Kirby: I do not know that anything has been brought out on the cross-examination in reference to the appliances for the use of electric current and the efficiency thereof and the problematical question of what the future is going to bring forth, whether they burn with more efficiency or whether they do not; it opens up a large sphere of speculation?

Mr. MATHEWSON: That is the only question I have on that subject, but it is directly related to the questions of counsel for the defendants.

The MASTER: I will allow it.

6199 Mr. KIRBY: Exception.

Mr. MATHEWSON: And it has been answered.

Q. As to your pressure taken behind the check, that would show, would it not, substantially, the pressure in the main with what small falling there might be between the main and the foot of the burner?

A. It would show the pressure of the main less whatever loss of pressure there might be between the main and the foot of the burner.

Q. In other words, it has some practical relation to the pressure law?

A. Yes.

Q. Now, taking this checked burner, what is the effect on the flame at the outlet where ignition takes place?

A. The check is so designed that its area, the area of the orifice in it is smaller than the area of the orifice or the orifices through the tip and the relation between them is chosen so that at the pressures for which the checked burners are designed to be used the pressure under the tip will be the proper pressure for the most efficient consumption of gas.

Q. It delivers it with less swirl to the burner?

A. As the burner is designed a piece of wire gauze is inserted between the check and the tip, which steadies the flow of gas and delivers the gas to all parts of the orifice in the tip at the same rate and same pressure and by doing that makes the flame uniform over its whole surface.

Q. In some of the photographs two flames appear from burners on the same pipe. Was that pipe large enough so as to deliver substantially the full pressure to each burner?

A. It was.

Q. Now, as to the Bray high pressure burners, the question was asked of you yesterday as to burners in general use. Is the Bray high pressure burner, which you have shown as giving you 6200 results of high pressure, in general use?

A. Yes, it is.

Q. In the City of New York, so far as your observation goes?

A. Yes.

Q. My question, in other words, is whether it is an unusal burner or one not commonly in use?

A. It is a very common burner.

Q. As to table top burners, such as described by Mr. Addicks, have you ever made tests as to the candle power given by the table top burners as compared with the ordinary Bray burner, say No. 6?

A. I have.

Q. And what is the percentage of efficiency or candle power of one over the others, pressure and other conditions being the same?

A. Eight per cent. in favor of the table top.

Q. I will ask you a final question. As to comparison of efficiency of gas or cost per candle of gas as reported by different companies, is it possible to make a comparison which will be reliable or valuable without knowing the apparatus with which the tests are made, the experience and capacity of the tester and all other conditions surrounding such tests?

A. The figures as to efficiency, of course, depend entirely upon the accuracy of the photometric readings upon which those efficiencies are based, and my experience with the photometrical arrangements at a number of gas works, and the manner in which the photometer tests are taken, has put me into a state of mind in which I will not accept anybody's photometer results as being right until I have examined the photometer, the room and the method in which the tests are made. No comparison can be made between two tests unless you know that both tests are accurately made, and I think that the presumption is in favor of their not being accurately made until you know the conditions.

6201 Q. You mean to say that that is the result of your experience from tests and revision of tests?

A. Yes, sir, that is from my experience as to the way in which tests are made in quite a number of gas works.

Recross-examination by Mr. Kirby:

Q. When did you make your comparative tests between table top burners and Bray check burners?

A. I think it was September, 1892; I am sure of the 1892, and I think it was September.

Q. Where did you make them?

A. In the photometer room at the Market Street gasworks in Newark, New Jersey.

Q. What kind of gas was used?

A. A mixture of 47 per cent. of coal gas and 53 per cent. of carburetted water gas.

Q. What was the resulting candle power?

A. By the works test something over 22, I don't remember exactly. I did not put it down in my book——

Q. By your test?

A. That was my test, the works test. And by the City Examiner 21.87. I put that down.

Q. Do you know whether or not this table top burner was designed for testing candle power of low candle power gas?

A. Why, I don't know. I have an impression that it was designed for use in England. I know it was designed for use in England, where, as a rule, candle powers are low.

Q. You say Bray burners are in general use in the City of New York. What do you mean by general use?

A. That it is not an unusual thing to see them and find them.

Q. You cannot give a better definition than that?

A. As I said yesterday, my knowledge of the conditions in the City of New York is not detailed, and it is pretty hard to say. In walking along last night, having had my attention called to
6202 the fact, recalled to it by your cross-examination, I noticed the burners along Washington Street, well, from Vesey, I think, is where I began to get into the region where they were burning gas, up to Warren Street, where I turned off to go to the ferry, and I should say that of the burners that I looked at, about 30 to 40 per cent. were Bray checked burners.

Q. You looked in the store windows?

A. I looked in the store windows.

Q. Did not walk through the buildings?

A. No, I had not time.

Q. But your experience here in the city on such matters is not very great, is it?

A. No, but reasoning from analogy I know that the Bray burner is very common in Newark and Jersey City and around there, so I should imagine it was in New York.

Q. But New York is peculiar, you know?

A. The conditions in New York are similar to those of Jersey City and Newark, in that the companies in all those cities give away Bray burners.

Q. Mr. Forstall, what do you consider would be the effect if the appl-ances for the use of gas were so improved as to increase the efficiency of the use of such gas?

A. Well, I know what the effect of one increase in efficiency has been, and that is the adoption of the Welsbach burner, which has been to prevent the gas companies from having as great an increase in sales as they had before.

Q. Don't you think that would also apply to your answer in reference to increased efficiency of electric light?

A. I think very possibly it would cut down the increase in the sales of electricity by the electric light company; it would not cut down the increase in the number of people who used electric light in preference to gas.

Q. The question, I suppose, that concerns the gas and electric light companies is not how many persons are using the light, but
6203 how much current or gas is sold?

A. The gas companies—I cannot answer for the electric light companies—but the gas companies desire to sell as much gas as possible, but they also desire to have as satisfied a consumer as possible, so they will not have to look after him all the time to keep him from going somewhere else; therefore, the gas companies will welcome any more efficient appliances for the use of gas than have been brought out.

Q. As a matter of fact, is not the mantle burner to-day so improved over the original Welsbach burner that the efficiency of the present mantle burner is some four times that of the original Welsbach?

A. Which do you mean by the original Welsbach?

Q. I mean the Welsbach mantle which came into use——

A. Of what year?

Q. Some fifteen years ago, say.

A. Well, I tested some Welsbach mantles in 1886 or 1887, and I think that is the first time they were introduced into this country; in fact, the patent was granted in 1885 or 1886 to Welsbach; and I should say, as I remember those tests, that the present burners are 2½ to 3 times as efficient as the burners I tested at that time.

By Mr. Mathewson:

Q. You were secretary of the American Gas Light Association for some years, were you not?

A. I was secretary for eight years.

Q. And an officer otherwise?

A. After resigning from the office of secretary I was made third vice-president and promoted to be the first vice-president, at the time of the dissolution of the association and its entering the American Gas Institute.

6204 Q. Are you a member of the American Society of Mechanical Engineers?

A. Yes, a member of the Society of Mechanical Engineers, and the Societé Technique de l'Industrie du Gaz en France.

Q. That is the French company, I suppose?

A. Yes, that is the French association.

Oscar H. Fogg, recalled for further examination, testified as follows:

Direct-examination by Mr. Mathewson:

Q. Mr. Fogg, was your attention drawn to Mr. Edgerton's testimony in reference to pr-ssures that he took at certain points, and his argument that the pressure within the districts or any particular district would be found within the boundary of 1.5 inches or might be?

A. Yes, it was.

Q. Have you taken pressures upon various points in various districts and presented the result of such pressures for the different hours of the day selected upon a chart so as to show the difference in pressure at different points, the same initial pressure remaining at the station?

A. I have had profiles made up from charts that were taken, yes.

Q. These profiles to which you refer were made up, were they not, from recording of actual Bristol gauges put at different points with which you are familiar?

A. Yes.

Q. Were they checked and revised by you?

A. The gauges on the districts are always checked by the man removing the chart. I make it a point to frequently inspect gauges on the district myself. These charts that are presented have not been taken off by me directly. I have examined every chart taken from the gauges every day as they are brought in.

6205 Q. By your men?

A. Yes.

Q. And you have the original gauges for each district, have you?

A. Yes, sir.

Q. And you have the men here who took them off the points which are indicated on each particular gauge for examination, if desired?

A. Yes, sir.

Q. Now, will you take the first chart which you have?

A. Is there any particular district which you want to start with?

Q. No, in any order that you please, Mr. Fogg.

(Witness produces chart.)

Q. Now, this chart that you show represents the territory supplied by the 99th, 111th and 132d Street stations, does it not?

A. Yes, sir.

Q. And are the places where the gauges whose results are charted, located, indicated on the map at the right of the main chart?

A. They are.

Q. And the reading of each station is indicated by a line here corresponding to the color which is placed opposite that station, in the schedule at the right, is that correct?

A. It is.

Q. So that by noting the color of the line you can in each case ascertain the station at which the reading was taken?

A. That is correct.

Q. Now, what date does this chart represent?

A. That chart represents the pressure for twenty-four hours, ending at 7 o'clock, January 17th—7 A. M.

Q. And at the top of this chart we have the various hours, have we not?

A. The various hours of the day.

Q. And that applies to each horizontal or ragged line, is that right?

A. Each vertical line here, the hour and the point at which the ragged line or pressure line intersects it, the pressure at that time.

6206 Q. And pressures are at the right and left in duplicate of the chart?

A. Yes.

Q. I call your attention to this reading about a quarter before 7 P. M., what is the highest reading, the broken line in orange?

A. That is the pressure at the 132nd Street station, the works pressure.

Q. Now, take these gauges; except so far as the station pressure is concerned, they represent places where there are actual services?

A. They are on actual services in every case, those referred to as district gauges.

Q. And do these charts and the profiles of the others you will present this morning represent the actual normal working conditions of the company?

A. Yes.

Q. No change of pressure or anything else to meet any special requirements?

A. None whatever.

Q. Now, I observe on this chart at one point at one station the pressure was as low as .7 of an inch, and that at another point in the same district the pressure was as high as what, according to the recording gauges?

A. At the same time, at another point in the district, we had a pressure of 28½ tenths.

Q. That was about 6 P. M., that is more than that?

A. From 6:15 to 6:30.

Q. That is 29 tenths there, while it is 27 tenths here?

A. Yes. I read it here, it is a difference of half a tenth.

Q. That would be a difference of 22 tenths?

A. That is right.

Q. The broken lines here represent the pressures, do they not, at the various holder stations?

A. They represent the pressures at the various stations which supply the district.

Q. And it is so indicated in the schedule at the right?

A. It is.

6207 Q. Now, at 6 o'clock P. M. and thereabouts in the evening, is it not true that this chart shows that the company was outside the requirements of the law at both ends, or at some points in the district it was below one inch and at some other points it was above two and one-half inches?

A. Yes.

Mr. Mathewson: I offer that in evidence.

Chart received in evidence and marked Complainant's Exhibit 345.

Q. Now, will you produce the next one?

(Witness produces chart.)

Q. This profile which I show you is made up in the same manner which you have described for the previous one?

A. It is.

Q. And it shows the district supplied by the 44th Street station?

A. It does.

Q. That is service No. 6 (indicating)?

A. Yes, that is at a point in the district.

Q. I observe at 5 P. M. the pressure appears to be 43 tenths inches at one point and at the same time at another point it appears to be about 18½ tenths, does it not?

A. A trifle over 18, yes.

Q. Is there an even greater difference in that at 6 o'clock?

A. Yes.

Q. Where you have 44.1 tenths in one place and at another point it is only 14 tenths?

A. 14½ tenths.

Mr. Mathewson: I offer that in evidence.

Chart received in evidence and marked Complainant's Exhibit 346.

Q. Is this profile which you now produce for the territory supplied by the 42nd, 63rd and 65th Street stations?

A. Yes, sir, it is.

6208 Q. I observe here at a few minutes to 7 o'clock a pressure of 4.65 inches is reached?

A. That is correct.

Q. And at the same time there appears to be a pressure at another point as low as 1.4 inches?

A. Yes.

Q. So that in many cases on this chart there appears to be a much greater difference than 1.5 inches between different points at the same hour, does there not?

A. A very much greater difference. There is a difference of 3.2 inches in that one case that you referred to.

Mr. Mathewson: I offer that in evidence.

Chart received in evidence and marked Complainant's Exhibit 347.

Q. Now, this chart which you have now produced shows the territory supplied by the 14th Street station, does it not?

A. It does.

Q. And one service shows at a little after 5 o'clock, about twenty minutes after 5 o'clock, 4.7 inches pressure?

A. That is right.

Q. And at the same time another point in the system shows a pressure of 1.5 inches, does it not?

A. 1.6 inches at the same time; that 1.5 inches is a little bit later.

Q. But here also, is it not a fact, that for considerable periods there is a difference much greater than 1.5 inches?

A. There is a difference of over three inches in the case you cite.

Mr. Mathewson: I offer that chart in evidence.

Chart received in evidence and marked Complainant's Exhibit 348.

Q. Mr. Edgerton testified in substance that every time 6209 there was a fall observed outside the testing point the pressure might be increased at the works or if a high pressure was observed it might be reduced at the works and thereby meet the requirements. Have you made profiles showing the rising or falling pressure at the same time?

A. I have made profiles showing the rising and falling pressures of the district gauges, without direct reference to the pressure maintained at the works.

Q. Will you produce those?

A. Yes.

(Witness produces charts.)

Q. They are made from the readings of the same kind of gauges, are they?

A. Yes, sir.

Q. Now, this which I show is headed, "District supplied by East

63rd Street station; pressure from 3 P. M. to 9 P. M., January 16, 1907"?

A. That is right.

Q. What is this left-hand point marked three hundred?

A. That is the hour that is 3:00.

Q. And the readings at the left represent pressures, do they?

A. Yes.

Q. Now, the pressure, according to this chart, does not rise evenly in all parts of the district at the same hour, does it?

A. It does not.

Q. In other words, the gauge at one point indicated by the green line of 311 East 72d Street appears to run substantially uniform?

A. With very slight variations.

Q. At the same time the pressure shown by the black line which is 408 East 63d Street, only nine blocks away, rises very rapidly?

A. It does.

Q. What is the pressure at seven o'clock, at the last point mentioned as indicated by the black line?

A. 5.9 inches.

Q. And what was the pressure at the same hour at 311 East 72d Street, only nine blocks away? 6210

A. 2.2 inches.

Q. And there you have more than the difference allowed by law of 1.5 inches pressure, have you not?

A. Very much.

Mr. Mathewson: I offer that in evidence.

Received in evidence and marked Complainant's Exhibit 349.

Mr. Page: Did you explain what the green line was?

Mr. Mathewson: That is the pressure at 311 East 72d Street as shown on the explanatory table at the upper left hand corner.

Q. Have you another one taken from another district?

A. Yes. (Producing chart).

Q. You now produce a chart headed districts supplied by 44th Street station showing certain pressure gauges?

A. I do.

Q. And the lines of those gauges at different hours from 3 to 9 P. M. are represented by the different colors, are they not, as indicated on the side?

A. They are.

Q. Well, in this case it appears, does it not, that say between 4:30 at 5 o'clock all the pressure at one of the points is rising rapidly, and it is falling at every other point of the four points?

A. That is correct, yes, sir.

Q. And does it not appear repeatedly that where it is rising at one point it is falling at another within this radius?

A. It does.

Q. And here, too, the range is considerable more than 1.5 at the same hour, is it not, in various instances?

A. It is over 2½ in one case and considerably over 1½ in every case with the exception of the lower three lines.

Mr. Mathewson: I offer that in evidence.

6211 Received in evidence and marked Complainant's Exhibit 350.

Q. The profile which you now show me is headed districts supplied from Inwood station and is made up on the same basis, is it not, as the previous two charts?

A. It is.

Q. And does this also show pressure rising at one point and falling at another on the same occasion?

A. Yes, it does.

Mr. Mathewson: I offer it in evidence.

Chart received in evidence and marked Complainant's Exhibit 351.

Q. Does it show a difference at the same hour of more than 1½ inches?

A. Yes, it does.

Q. Now, I will ask you, generally, whether it would be possible, therefore, to regulate the pressure at the station by the reading of pressure at any one point, so as to regulate the entire district?

Mr. Kirby: I object to that. You have not shown the witness is qualified to answer.

Mr. Mathewson: He testified he has charge of the pressure under Mr. Simpson.

Mr. Kirby: What does that mean? He is not an engineer.

Mr. Mathewson: I will ask a few questions on that.

Q. You have observed pressures, have you not, Mr. Fogg, for some years?

A. I have.

Q. Have you had charge of the pressure charts in these various districts, and have they been brought to you for checking?

A. They have.

Q. And have you been generally familiar with pressure at stations and pressures at various points in the district, as shown by the charts?

6212 A. I am familiar with the pressures at the stations, as shown by the charts, from having observed the charts and knowing that they are correct, knowing that they have been tested with the gauges, the water gauges.

Q. Then from your experience and observations, as plotted on these charts and otherwise, I will ask you whether, in your opinion, it is possible to regulate the pressure at the station as you find pressure at one point or another in your district going up or down, so as to affect the regulation for the entire district, within any special limits?

Mr. Page: Objected to on the ground that it is incompetent, immaterial and irrelevant. The witness's observation of charts does not make him an engineer.

Mr. Burr: I join in the objection. He does not appear to have knowledge about them.

The Master: You may cross-examine, gentlemen.

By Mr. KIRBY:

Q. Are you a graduate of any technical or scientific school?

A. I am not.

Q. Have you ever operated a gas works anywhere?

A. I have.

Q. Where?

A. Flushing, Long Island, Ocean City New Jersey, Yonkers, New York.

Q. What were your duties at such plants?

A. Superintendent at Flushing, engineer of works at Yonkers, and construction engineer at Ocean City, and later, when the plant was operated, its superintendent.

Q. When did you enter the employ of the Consolidated Gas Company?

A. In the early part of 1904.

Q. What were your duties at that time?

A. In 1904?

Q. Yes.

6213 A. At the beginning of my employment with the Consolidated Gas Company, I took charge of the construction of the 36-inch main between East 111th Street and West 136th Street, about which I have testified.

Q. Since then have you been engaged upon similar work for the company, laying of mains and such?

A. Not the construction of any mains since that time.

Q. Have you had any direct work in the operation of any plant?

A. By plant, do you refer to their manufacturing stations?

Q. Yes.

A. None.

Q. Have you ever had any direct work in relation to the regulation of pressure of the gas sent out either from their holder stations or manufacturing stations?

A. I have.

Q. What have you done?

A. I have had supervision of the pressure gauges maintained on the districts throughout the city and the men employed in caring for those gauges. I have, from time to time, as the pressure conditions varied, kept the chief engineer indirectly or through the general superintendent of mains informed as to any variations, so that the proper regulation at the works might be effected.

Q. Have you ever given any orders for the regulation of pressure at the works?

A. None whatever.

Q. Have you ever, in any way, had the pressure at the works changed?

A. None, except in the manner I have just testified. No one changes the orders as regards the pressure at the works except the chief engineer of the company.

Q. Then, I take it, that your work with the Consolidated Gas Company as having to do with pressures has simply been the readings of the pressures and in the endeavor to see that they were taken in the proper way and with proper apparatus?

A. No, it has more to do with it than that. I have, from time to time, as the need became apparent, had additional gauges 6214 set out in the district, made as I saw——

Q. Then we will add to those duties the installation of gauges.

A. And their maintenance, yes, sir.

Mr. Kirby: That is all. I contend, Mr. Master, that this witness has done nothing more than to check off readings and install pressure gauges and never changed or varied the pressure in any way at the various stations, and measured the results thereof, and the regulation has been in charge of another.

The Master: I will allow the question.

Mr. Kirby: Exception.

Mr. Burr: Same objection and exception.

By Mr. Mathewson:

Q. You may answer the question now. (Question repeated as follows): Then from your experience and observation as plotted on these charts and otherwise, I will ask you whether in your opinion it is possible to regulate the pressure at the station as you find pressure at one point or another in your district going up or down so as to effect the regulation for the entire district within any special limit?

A. I do not consider it to be possible.

Mr. Mathewson: That is all at present.

Mr. Kirby: What do you mean by at present?

Mr. Mathewson: I mean I may possibly recall any witness on another point, but I am through with this.

Cross-examination by Mr. Kirby:

Q. Referring to Complainant's Exhibit 325, I notice in the upper right hand corner thereof a plotting of a section of the city. 6215 From what source did you obtain the map I have just referred to?

A. The skeleton outline?

Q. Yes?

A. That is a reduction of any one of the standard maps we have in our office; I don't know which one. It is not to scale and no effort has been made to put it to scale.

Q. Was it taken from any exhibit in this case?

A. The outline of the map? No, not that I can recall.

Mr. Mathewson: It is merely to locate the place where these gauges are located by general description so he can identify them.

The Witness: Referring to the outline, but not to the figures appearing on it.

Mr. Mathewson: Yes.

Q. I notice set down in the spaces indicating streets certain lines having colors of orange, yellow, purple and green, and by reference to a key, that these represent different sizes of main. From what source did you get the information that mains of these sizes were upon these various streets and laid in the manner here set down?

A. From our own street mains record.

Q. From any exhibit in this case?

A. No.

Q. I notice the statement upon this exhibit as follows: "Territory supplied by 99th Street, 111th Street and 132d Street stations." From what source did you get that information?

A. From my own knowledge of the condition of the street mains in that section of the city.

Q. Are you prepared to state that this territory and none other is supplied by these stations?

A. There may be one or two connections at the lower end of the district which dovetail into another section.

6216 Q. Are you prepared to state whether or not any other stations supply any other part of this territory?

A. No other stations supply any part of that territory, except the statement that I just made, at the lower end of the district where several mains may overlap into this district. That would apply only to the lower part of the dis-rict.

Q. What do you mean by supplying territory from a certain station?

A. Are you speaking in the case of the three stations there, or any one of them?

Q. I speak with special reference to the chart, Complainant's Exhibit 345.

A. That would involve taking into consideration all the stations. We cannot draw the line between the territory supplied by any one of them in any case, because the main system is tied together all through.

Q. Which station supplies the more northerly section of this territory?

A. Above what streets?

Q. Above 170th Street.

A. The territory is supplied by 132d Street. The regulation of pressure is effected from the Inwood station, however, from the governor located at that point.

Q. How is that done?

A. The gas is sent to the Inwood governor by means of a transfer main and enters the governor at that point at Inwood, and goes out onto the district after being regulated by the Inwood governor.

Q. Does any other gas pass through that governor *at* except that which comes from the 99th Street station?

A. No gas directly from the 99th Street station goes through that governor.

Q. I mean the 132d Street station, the station to which you just made reference as having a main running to the Inwood governor, and the gas passing through that governor and supplying the more northerly section of this territory?

A. No.

6217 Q. Quite sure of that?

A. Reasonably so, from my knowledge of the main system and the records.

Q. What territory is supplied from the Inwood station?

A. None from the Inwood station itself; the territory that we are just speaking of, the pressure regulation is effected at the Inwood station. It is not a manufacturing station, it is merely a holder point.

Q. There is a holder at Inwood, is there not?

A. I have seen an old holder frame there; I don't know whether the holder is in the tank or not. I have not had occasion to be in the station.

Q. You are familiar with all this territory, you have stated, and with the distribution of gas therein?

A. As regards the street mains, yes, sir.

Q. But you don't know anything about where the gas comes from which goes through those mains?

A. From the 132d Street station, and I have so testified.

Q. But you are not prepared to state whether there is any gas going into any territory from the holder at Inwood?

A. I don't know what may have been done with the holder at Inwood, I don't know that any gas is in it, or has gone through it.

Q. I refer you to Complainant's Exhibit 351, which has printed thereon "districts supplied from Inwood station," what does that mean?

A. That refers to the district supplied from Inwood station, not by it.

Q. Well, what does it mean?

A. It means that the pressure regulation on the points shown in the profile lines there is effected by the governor at Inwood station.

Q. Do you know where that gas comes from?

A. From the 132nd Street station.

Q. None from Inwood at all?

A. None that I know of from Inwood.

6218 Mr. Burr: I note on this map at the bottom it says red figures in district sk[illegible] show elevation above mean high water. Where are the red fi[illegible]es?

Mr. Mathewson: That is in the sketch on the map above, in the upper right hand corner.

The Witness: It is possible that they have been omitted. They have been in this case, they are on the originals.

Mr. Mathewson: We will supply them. They would not show on the blue print, but we will put them in for you.

Q. Now, referring for a moment to Complainant's Exhibit 347, which has printed thereon, "territory supplied by the 42nd, 63rd and 65th Street stations," I ask if that street given as 79th Street is between the same avenues as 79th Street set down upon Complainant's Exhibit 345?

A. 79th Street, as shown there on Exhibit 347, is between 5th Avenue and the East River.

Q. While 79th Street, as shown on Exhibit 345, is between the same boundaries?

A. The same boundaries.

Q. Now, being familiar with the mains as they are laid, I ask if you will tell us what happens to the mains from either 42nd, 63rd or 65th Street stations when they get to 79th Street between 5th Avenue and the river? Do they stop?

A. No, they do not stop.

Q. Do they go on?

A. Yes, as mains. As conductors, I doubt if they do.

Q. As mains do they go on?

A. As a metallic structure, they do.

Q. Is there any dividing territory between that and the territory supplied by the 99th, 111th and 132nd Street stations, as set
6219 down on Complainant's Exhibit 345?

A. The boundary is shown, which is 79th Street, on that side, the dividing line.

Q. The mains go on? What do you mean by the dividing line?

A. A valve in the main itself.

Q. Is there a valve there which shuts off the gas of one territory from the gas in another?

A. I don't know in what condition those valves are. There are valves there.

Q. Are they closed?

A. I don't know in what condition the valves are.

Q. Well, you are familiar with all of this territory and with all these mains and with all the pressure gauges distributed throughout the territory. Did you ever look as to whether those valves are open or shut?

A. Only when I have had occasion to do so for some particular reason.

Q. Have you had occasion to do so while you were making up these charts or taking these readings to make them up from?

A. No.

Q. Do I understand you to state that on each main as it runs from one of these territories indicated on any one of these exhibits into another territory indicated on another exhibit that there is a valve to close off the gas in that main from the adjoining territory?

A. I would not attempt to say that there was a valve on every main anywhere. It is quite impossible for me to even assume that there was. I know the general division of that side of the city is effected at 79th Street.

Q. Or at any other street? Did you lay any of these mains yourself?

A. None.

Q. Have you made excavations for the purpose of repairing or renewing?

A. I have at times inspected mains in excavations made for that purpose, yes.

Q. Have you ever put any valves down or in?

A. Personally, no.

6220 Q. Under your supervision have any been installed?

A. Not under my supervision.

Q. Now, again referring to Complainant's Exhibit 345, and looking at these designations of various sized mains, which you have laid down upon the map in this territory, are you prepared to state that these are the only mains in this territory?

A. I am prepared to state that they are not the only mains in the territory. We made no attempt to put all the mains on those maps and the only object of putting the mains on the map is to give a general idea from what station the territory is supplied, and the larger or trunk mains leading into the districts; the mains are not complete and were not intended to be so.

Q. Upon Complainant's Exhibit 345 I note a small oblong hatching marked 1, and by reference to the index I see that is set down as 111th Street station; am I right in stating that on the date of January 16th, 1907, you took certain readings at that station?

A. No, I did not take any readings myself at that station; readings are taken every day at that station.

Q. By whom are they taken?

A. By the works' employés.

Q. Do you know who they were taken by on this day?

A. They are taken under the direction of a Mr. Barlow.

Mr. Mathewson: They are taken on the regular recording automatic gauges.

The Witness: And removed every day.

Mr. Mathewson: And as I said a few minutes ago, I have the men here and the original charts here if you wish to assure yourself on this point. I did not put them on because Mr. Fogg had general knowledge of it, but I will put them on if you wish.

6221 & 6222

Q. Have you any personal knowledge as to whether or not that gauge was registering properly on that day?

A. I have no personal knowledge, except that I have been told that it was.

Q. Do you know whether it has been checked by anybody?

A. I do know that it has been, yes.

Q. By whom?

A. The man removing the chart.

Q. How did he check it?

A. Comparing it with the water gauge, siphon gauge.

Q. How many times a day did he check it?

A. He checked it once a day.

Q. What kind of a pressure gauge is this that was used to take these readings?

A. A Bristol recording pressure gauge.

Q. And will you describe to us what the general character of such apparatus is?

The Master: Gentlemen, you will have to excuse me, we will have to suspend here now.

At 1 P. M. adjourned to Saturday, January 26th, 1907, at 11 A. M.

Last Exhibits:

Last Complainant's Exhibit, 351.
Last State's Exhibit, OOO.
Last City's Exhibit, 236.

6223 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucian L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, *January* 26, 1907—11 A. M.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby, Mr. Page.

6224 Oscar H. Fogg resumes the stand and further testifies:

Cross-examination by Mr. Kirby (resumed):

Q. I call your attention to Complainant's Exhibit 345, the chart which we were looking at yesterday afternoon when we adjourned. The line upon this chart showing the maximum reading of pressure is taken at the Inwood station, according to the reference table. Will you inform me just where at the Inwood station that pressure is taken?

A. You say the maximum line on the chart is taken at Inwood?

Q. Yes.

A. I do not think that is the case, Mr. Kirby.

Mr. Mathewson: That is 132d Street.

The Witness: The Inwood station is down here (indicating).

Q. Very good. Now, we will take the line——

A. These colors on the prints are rather misleading.

Q. You see on the chart here the line instead of being broken with a long and then a short line is chopped up so that it is almost impossible to ascertain what it is?

A. On account of the short turns.

Q. Very good. We have this line. The line which on the lefthand side of the chart starts at the reading, 2.2 inches?

A. Yes, sir.

Q. And continues across the chart, ending on the righthand side of 2.25 inches, is that correct?

A. That is correct.

Q. That is the line indicating the pressure reading at the Inwood station?

A. Yes, sir.

Q. Will you inform me where at the Inwood station that reading was taken?

6225 A. The reading was taken at the outlet of the governor, at the point where the gas passes into the main system of that district.

Q. And you stated yesterday that the gas was brought to Inwood from where?

A. 132d Street station.

Q. How was it taken to Inwood?

A. By means of a twenty inch transfer line.

Q. That is, a main running from 132d Street to Inwood, twenty inches in size. Now, from this twenty inch main are there any transverse mains or services taken; is any gas taken from that main before it reaches the Inwood station?

A. None whatever, that I know of. That main is known as a transfer main for the sole purpose of carrying gas from the 132d Street station to Inwood.

Q. Is there any line upon this chart indicating the pressure in that main?

A. No, sir; no line on the chart showing that pressure at all.

Q. The pressure indicated at the 132d Street station is different from that in this main running to Inwood?

A. The pressure indicated at the 132d Street station in which main?

Q. In any main laid down upon this chart?

A. Oh, yes, yes.

Q. Now, do you know the pressure in that main?

A. I know it is about seven or eight inches.

By Mr. Mathewson:

Q. That is in the main from 132d Street to Inwood?

A. The transfer main to the Inwood station.

By Mr. Kirby:

Q. That is not on this chart?

A. No pressure of transfer mains shown on the chart at all, no.

6226 Q. When that gas reaches Inwood, it there passes through a governor, its pressure is reduced, and the line which we have spoken of on this chart shows the readings of pressure on the side of the governor from which the gas leaves it to go to the territory supplied from Inwood?

A. That is right, yes, sir.

Q. Let us look at point 5, being 175th Street and Boulevard Lafayette, indicated upon the diagram by a green line. Is point 5 supplied from the governor at Inwood?

A. No, not entirely.

Q. What is it supplied from?

A. As I have before testified, it is impossible to say in that district the pressure entirely supplied by any one particular station, inasmuch as there are three stations, and one governor station, which play into the combined main system of that district.

Q. Now, you have just testified that the main running from 132d Street to Inwood has no gas taken therefrom until it reaches Inwood. What other main is there that would run to point 5?

A. None that would run direct to point 5. There is, however, a main leaving the 132d Street station known as a district feeder, a main thirty inches in diameter, which connects into the general distribution system at 129th Street and Amsterdam Avenue. From this point of connection there is a main north in Amsterdam Avenue tying into the various distribution mains at various points north and south, which would in a measure affect the pressure at 175th Street and Boulevard Lafayette; to just what extent that particular main would affect that pressure I am not prepared to say.

Q. Are there any points where pressures were taken and laid down upon this chart which might draw their gas from this main to which you have just made reference, from points other than point 5?

A. No, not directly. That main affects the entire distribution system in that district.

6227 Q. Would it affect point 11, being 185th Street and Port Washington Avenue?

A. That I do not believe anybody knows definitely. It would be quite impossible to state.

Q. Now, if we should raise the pressure at Inwood station at its maximum point, which is now, as set down upon this diagram, 3.2 inches, to 4½ inches, or between 4½ inches and 5 inches, what effect would it have upon the pressure at the same moment at points 5 and 11?

Mr. Mathewson: Are you referring to the green line?

Mr. Kirby: Yes.

Mr. Mathewson: That is 3.4 inches, not 3.2.

Mr. Kirby: I am referring to Inwood.

A. You asked me what the effect would be upon the pressure at this point, 176th Street and Boulevard Lafayette? It is my judgment that the pressure at that point would be increased to some extent.

By Mr. Mathewson:

Q. If what?

A. If the line indicated by Mr. Kirby representing the Inwood pressure, at the outlet of the governor were increased to a point between 4½ and 5 inches.

By Mr. Kirby:

Q. And it would be possible to increase the pressure at the Inwood station so as to bring that down higher than 1 inch and not to permit it to go higher than 2½ inches, would it not?

A. It might have that effect, not considering the effect that it would have upon the other pressures in that district. There undoubtedly would be a relative increase in all the other pressures, some of which are already up to 2½ inches and some over.

6228 Q. Point out to me one that is above 2½.

A. Right there (indicating on chart).

Q. Which line did you indicate?

A. I indicated the red line which indicates the pressure on Bolton Road.

Q. At point 6?

A. Point 6.

Q. Where does point 6 get its supply from?

A. Point 6 is north of the Inwood governor station, and I think it is perfectly safe to assume that the pressure regulation at that point is effected by the Inwood governor station.

Q. Does it obtain its supply from any other point than the Inwood station?

A. That again would be impossible to answer. Its supply, as I have already said, comes from the station at 132d Street. Its pressure regulation, I believe, would be entirely effected by the regulation at the Inwood station.

Q. So that if the main running to point 6, being Bolton Road, had a governor thereon which would not prevent the pressure rising above 2½ inches, at no time could the pressure at point 6 be above 2½ inches, could it?

A. If there were a governor upon that main, and that main was supplying only the one point or the one immediate section referred to by you, the governor could be so set that the pressure would not go beyond any given point.

Q. And you have testified that you had information and knowledge that this main does only supply that section, and does only come from the Inwood station, so that you could govern that section in that way, could you not?

A. I am referring now to the one main supply up there, No. 6, particularly.

Q. So am I. Now, will you tell me where the pressure reading was taken at this point 6; was it directly upon the main?

6229 A. No, it was not on the main. The gauge in that case is attached to the head of the service, or at a point before the gas reaches the consumer's meter inside the house.

Q. What was the size of the main at this point?

A. That I could not tell definitely without referring to the record.

Q. What size would you think?

A. I would not be able from the conditions—I should imagine it might be a six inch main or an eight inch, but that is something at which I could not more than guess.

Q. Was it the main from which the service pipes in that district were drawn?

A. It was.

Q. And to which the service pipes were attached?

A. Yes, sir.

Q. The reading at 111th Street, being point 1, was taken where?

A. That gauge is attached to the outlet main from the station at the point where it connects into the distribution system.

Q. Any services attached to that main?

A. To the main at the point where this reading is shown?

Q. Yes.

A. Oh, no, that is the works' pressure.

Q. Where was the reading taken at 99th Street?

Mr. **Mathewson**: All those are station pressures.

A. The same point.

Q. Those services attach to the mains at this point?

A. Yes, that is inside the building (indicating the works' pressure line on the chart).

Mr. Mathewson: Those pressures are station pressures without services attached. All the others on the chart are the service pressures.

Q. And that is also true at Inwood, except that these taken at the governor point, such as you have already testified to?

A. Yes, sir.

Q. Where was the reading taken at 132d Street?

A. At the same point inside the building.

6230 Q. Where was the gas coming from which entered this main upon which the pressure was taken?

A. At which point?

Q. 132d Street.

A. That I cannot tell at all. It might have been coming from any one of the stations of the Consolidated Gas Company.

Q. Was it coming from the holders at that station?

A. Oh, yes.

Q. How many holders are there?

A. One holder of the Consolidated Gas Company.

Q. Another holder of the Standard Gas Company?

A. I believe so.

Q. Are you prepared to state that the gas entering this main came alone from the holder of the Consolidated Gas Company?

A. No, I am not.

Q. This is the point where the gas from the Standard Gas Company feeds into the mains of the Consolidated, is it not?

A. Where the gas of the Standard Gas Company feeds into the mains of the Consolidated?

Q. Of the Consolidated?

A. They may.

Q. Don't you know?

A. I do not.

Q. I refer you to the testimony of Simpson, 205, where he states:
"Q. You have been referred to as the authority as to where the gas was delivered, from the various subsidiary companies, into the mains of the Consolidated Gas Company. Can you tell me where those gas connections are between the mains of the Standard and the mains of the Consolidated Gas Company? A. Yes. Q. Where are they? A. The principal connections at 132d Street and Broadway; there the Standard delivers gas into our 30-inch main; also into a 20-inch main going to Inwood, and at 125th Street and Fifth Avenue; and at 125th Street and Eighth Avenue, through
6231 our connections between the New Amsterdam mains and the
Consolidated mains, for the purpose of reinforcing the New Amsterdam pressure."
Does that refresh your recollection in any particular?

Mr. Mathewson: If Mr. Simpson so testified it probably is the case. It probably won't refresh his recollection though.

A. It don't refresh my recollection at all, because I have no knowledge on the subject. If Mr. Simpson has so testified it is undoubtedly correct.

Q. Then, as a matter of fact, you don't know that the gas, the pressures of which you have taken at the various points in this district, is not part of the gas coming from the holder of the Consolidated or the holder of the Standard Gas Company?

A. I would have no reason for knowing that at all.

Q. But you are familiar with how the regulation of pressure is attempted to be effected?

A. I am, yes, sir.

Q. And expressed an opinion as to whether or not it could be so regulated as to keep the pressures within the limits of 1 and 2½ inches?

A. Yes.

Q. Have you ever made any attempts at the 132d Street station to regulate the pressure from the Consolidated Gas Company or the pressure coming from the holder of the Standard Gas Company?

A. I already testified that I have made no attempts to regulate the pressure at any one of the stations; that that is entirely within the jurisdiction of the chief engineer and he alone gives orders for the regulation of the works' pressures.

Mr. Mathewson: Mr. Fogg testified he gave the chief engineer the charts and kept him informed of the pressures generally in the district, for the chief engineer's information. 6232

Mr. Kirby: He was quite willing to express an opinion thereon, as to what could be done.

Mr. Mathewson: Of course, he is.

Mr. Kirby: We are trying to find out how much weight that opinion should have given to it.

Q. Are you familiar with the interior of the 132d Street station so as to know the means used therein to turn the gas from the holder of the Standard Gas Company into the mains of the Consolidated?

A. I am not.

Q. Have they what might be called a switchboard there for that purpose?

A. Not that I know of.

Q. You took readings at point 5 of which we have already spoken. To what was the pressure gauge connected at this point?

A. At that point the pressure gauge is connected to a ¾-inch pipe which is extended from the service at a point before it reaches the consumer's meter.

Q. And do you know the size of the main to which that was connected?

A. 6-inch main.

Q. And were there other services taken off from that main?

A. Yes.

Q. Do you know the consumption of gas in that locality?

A. No.

Q. Do you know the number of cubic feet of gas which passes through a 6-inch main each twenty-four hours?

A. No.

Q. Do you know the carrying capacity of that main?

A. Under what particular conditions?

Q. Under the conditions which are expressed upon that chart?

A. That would have to be determined by the drop in pressure in a given length of pipe.

6233 Q. Could you tell me the carrying capacity of a main of definite size under a definite pressure for a definite distance?

A. I could calculate it, yes.

Q. Being able to calculate that, could you tell me what the carrying capacity would be of a main of twice the diameter under the same conditions?

A. By calculating in the same way.

Q. Does that carrying capacity increase directly as the diameter or the square thereof?

A. It increases as the square of the diameter, 1-5 power of the square of the diameter.

Q. That is a little more than the square?

A. A little bit more. I would like to correct that answer. That is rather confused. It increases as the square root of the 5th power of the diameter. I have not had occasion to refer to the formula. I have calculated tables which we use almost altogether in the place of the formula nowadays.

Q. If a main of larger diameter than that which now supplies point 5 were put down and that main had supplied to it, or could have supplied to it, gas at the same rate per cubic feet of area as the main which now supplies point 5, do you or do you not consider that the pressure at point 5 would be less likely to fluctuations than it is at the present time, as indicated by this chart?

A. No, I do not believe it would be.

Q. In other words, it would make no difference how large a quantity of gas point 5 would have to draw upon, the pressure would fluctuate as you indicated by the diagram?

A. It would depend entirely upon the initial pressures maintained.

Q. We will assume the same initial pressure is maintained and assume it has more than four times the capacity of gas to draw upon.

A. It might reduce the variations at that particular point.

Q. It would, wouldn't it?

A. I think it would, yes. It might.

6234 Q. But wouldn't it?

A. I believe it would. I think it would.

Q. Now, let us take point 7, 533 Lenox Avenue, upon what kind of a pipe were the readings taken at that point?

A. What size?

Q. Size? Was it a service pipe it was taken on?

A. The reading was taken directly from the head of the service before it entered the consumer's meter.

Q. To what size service main was this service attached?

A. I don't know.

Q. What size do you think?
A. I don't know.

Q. Other services were taken from this pipe?
A. Yes, sir.

Q. Do you know the size of the transfer main or supply which supplies that district or trunk main or whatever you call it—I don't know how to designate it—in your company?
A. It would not be a transfer main.

Q. What type of trunk main or a supply main?
A. Yes. And there are several leading into the district from various stations.

Q. And you don't know their sizes?
A. Oh, yes, I know their sizes. The main from the East 111th Street station is a 36-inch; the main from 132d Street, as already testified, is 30-inch, leading to the point where it connects into the distribution system.

Q. Now, do you know how many cubic feet of gas per day are drawn from the service mains supplying this district, compared to the number of cubic feet which are drawn from the service mains supplying point 6?
A. I do not.

Q. Have you ever calculated the volume of gas which is delivered or could be delivered during 24 hours to any one of the points outside of the stations where you have taken readings as set down upon this chart, Complainant's Exhibit 345?
A. I have not.

6235 Q. Have you ever done that for any point or section of the city?
A. No, I have never had occasion to.

Q. Have you ever taken a point where your readings have shown that there has been no variations below the maximum of 2½ inches or below the minimum of one inch, calculated the volume of gas which was delivered to that point during any 24 hours, the diameter or carrying capacity of the mains, including trunk mains, service mains or whatever mains went to that point, and compared the result with the amount of gas and the size of pipe which would be delivered or ran to a point where the variations showed a maximum of over 2½ inch and minimum of less than one inch.
A. I have not.

Q. Now, will you take the chart of which you have the original, which is more easily read than the others, and point out to me the points where the readings were taken, where the pressure during the 24 hours at no time went up to 2½ inches and at no time fell below 1 inch?
A. The point at 38 West 125th Street shown by the yellow line, point No. 10.

Q. Is that the only one?
A. The point at 533 Lenox Avenue, No. 7, that is a brown line.

Q. Any other?
A. No; I don't see any others.

Q. The point 11, being 185th Street and Fort Washington Avenue, I presume obtained its gas from the same source as point 6, being on Bolton Road, did it not?

A. Yes sir,

Q. The point 9, 1911 Amsterdam Avenue, indicated by the blue line, obtained its gas from what source?

A. From the 132d Street station.

Q. Show me the blue line on this, will you? I cannot make out the difference?

A. Here it is (indicating on chart).

Q. And the ranges are of tremendous variation, are the readings at the station, the large line going as high as 6.9 inches, 6236 and the line reading maximum, 4.1 inch and a line reading maximum of 3.4 and the purple line of the Inwood station to which you have already made reference, reading maximum 3.2?

A. Those were the works' pressures, yes, sir.

By Mr. Mathewson:

Q. Those are the pressures, are they not, on the distribution mains from which services are taken off somewhere away from the station?

A. The high pressures.

Q. Station pressures on the transfer mains?

A. Oh, not the transfer mains, no.

Mr. Kirby: Mr. Fogg testified he made no readings of the transfer mains running from 132d Street to Inwood.

Mr. Mathewson: So I understood; or on any of the transfer mains.

Mr. Kirby: Well, I don't know. There is none on this chart.

By Mr. Kirby:

Q. By backing on the service mains you mean that is the initial pressure at which the gas leaves either here from a holder or from the holder station at Inwood?

A. That is the initial pressure at which the gas enters the distribution mains.

Q. Now, take Complainant's Exhibit 346. Looking at the territory plotted out on the upper right hand side of this chart, I notice that the mains from the 44th Street works run over as close to 14th Street and the East River, where the 14th Street station of the Consolidated Gas Company is located, as Third Avenue; do you know whether or not there are any mains which were not closer to that station than the yellow line indicated upon this map?

A. There may possibly be a connection to it at that point. 6237 My impression is that there is no main supplied by 44th Street station east of Second Avenue, so that quite likely there is a connection east of that point you speak of as far as Second Avenue.

Q. Do the mains or any other pipes, whatever you may call them, from the 14th Street station, interlock with those from the 44th Street station?

A. There are connections at points, yes.

Q. Can you indicate those points?

A. No, not definitely on this outline.

Q. On Complainant's Exhibit 348, giving the territory stated to be supplied from the 14th Street station, certain readings were taken at point No. 7, being 609 East 14th Street. On Complainant's Exhibit 346 certain readings were taken as to point designated on such exhibit as point 5, being 4 Irving Place. If point 7 on Exhibit 348 had been supplied from the 44th Street station as point 5 (No. 4 Irving Place) was supplied, is it your opinion that the variations in pressure at point 7 on Exhibit 348 would be any different or materially different from the variations at point 5 on Exhibit 346?

A. Assuming that the main system be extended to the point 609 East 14th Street?

Q. Yes, assuming that.

A. Yes, I think you would naturally assume that the pressure at 609 East 14th Street, then being farther removed from the point of supply or the works will be lower than it is at the present time, where it is directly outside of or within a short distance of the point of supply.

Q. The short distance of the point of supply being the distance from Irving Place to Tenth Avenue and 44th Street?

A. Yes.

Q. Point No. 5 (Irving Place) is supplied from Tenth Avenue and 44th Street, according to your chart, Complainant's Exhibit 346?

A. Yes; that's right.

6238 Q. No. 7 on Complainant's Exhibit 348, being 609 East 14th Street, is supplied, according to Complainant's Exhibit 346, from the 14th Street plant?

A. Yes, sir.

Q. Being 14th Street and the East River?

A. Right next to it, in fact.

Q. Now, I ask if 609 East 14th Street was supplied from the 44th Street works the same as No. 4 Irving Place is, whether or not it is your opinion that the variations in pressure at 609 East 14th Street would not be very close and similar to those now indicated by you at No. 4 Irving Place?

A. And I replied that I would naturally assume that inasmuch as point 609 East 14th Street would, after the main system had been extended, be at a greater distance—the point would be at a greater distance from the source of supply, that the variations might be greater.

Q. The difference in distance of 609 East 14th Street from 44th Street and Tenth Avenue, and No. 4 Irving Place from 44th Street and Tenth Avenue, would be but a very small amount, would it not?

A. 609 East 14th Street, I should assume about ¾—possibly a mile from 4 Irving Place, Second to Third Avenue, First to Second, Third to Irving Place, possibly a mile. I think I might say about ¾ of a mile, in my judgment.

Q. How far is No. 4 Irving Place from the works from which it obtains its gas, the trunk main from which it obtains its gas?

A. Thirty blocks north and south and practically the full width of Manhattan at that point.

Q. Does that trunk main run down Third Avenue?

A. There is a trunk main down Third Avenue, yes.

Q. Is that the trunk main which supplies No. 4 Irving Place?

A. Some connection from that main.

6239 Q. Is there a connection to any other trunk main supplying Irving Place?

A. Not from that system that I know of.

Q. So that the distance from 609 East 14th Street would be from Third Avenue and not from Irving Place?

A. Yes, it would; the connection from the trunk main. You have referred, however, to variations in pressure between Irving Place and the point mentioned.

Q. Quite so, and you have replied by taking the main distance of 609 East 14th Street as compared with No. 4 Irving Place?

A. Yes.

Mr. Mathewson: The distance is not very appreciable.

Q. And No. 4 Irving Place has to go to Third Avenue before it taps a trunk main?

A. A short block, yes.

Q. Your readings at 487 Broadway, being point 2, were taken from a service?

A. They were.

Q. At what point on that service?

A. At the head of the service before it enters the meter. All our gauges are so located.

Q. Do you know the size of the service main to which this service was connected?

A. I do not.

Q. Do you know the size of the trunk main to which the service mains was connected?

A. No, I do not.

Q. Where was the reading, No. 5 Second Avenue, being point 3, taken?

A. The gauge was attached to the head of the service.

Q. I presume that all of these readings then were taken at the head of the service before the gas entered the meter?

A. That is correct.

Q. And were the meters in all instances upon the ground floor or in the basement?

A. They were.

Q. And there was no separate service isolated for the purpose of taking these readings, was there? 6240

A. No service isolated especially for that reason, no.

Q. Now, were these various places houses or stores or what?

A. Both. Some apartments, some stores; the basements of large stores in some cases.

Q. During these readings did you take care to see that no gas was being used by the occupants of those stores or apartments or houses?

A. Oh, no.

Q. So that this indicates the pressure in the gas which was flowing through the meters and not through the house and being burned according as the desires of the occupants of the building demanded?

A. That indicates the pressure at the head of the service before it enters the consumer's meter which I think is a very close indication of the conditions of the service mains.

Q. Did you make any readings at identical times to ascertain what change might be made in the pressure owing to the consumption of gas in the particular apartment or store or house, upon the service of which you had your pressure gauge?

A. Throughout the apartment, throughout the building?

Q. Yes.

A. I have never done so.

Q. Now, point 6 is 317 West 42d Street. That is very close to the gasworks, is it not?

A. It is within a comparatively short distance of the gas-works. It is between Eighth and Ninth Avenues in 42d Street and the gasworks are located at 44th Street and Tenth Avenue.

Q. There are other works at 42d Street, are there not?

A. The 42d Street station.

Q. And gas is delivered from the 42d Street station, is it not?

A. Yes.

Q. Do you know whether or not the gas delivered from the 42d Street station runs through mains which are at given points connected with or interlocked with the mains from the 44th Street station?

6241 A. There are connections undoubtedly very often inserted so that in the event of its becoming desirable at any time the gas of one station could be truned into the mains of another where they are within the same general locality—the same general district.

Q. Do you know whether or not those valves are closed or were closed on the 16th day of January, 1907?

A. I know that their normal condition is closed and I know of no special case or no special reason for them having been opened since that date. They are supposed to be closed. I believe they are.

Q. Have you any record, or are you familiar with any record which would show on which days they were closed or were open?

A. I am.

Q. Can you tell me whether they were open at any time duringq the year 1906?

A. Not without looking it up.

Q. Can you tell me whether they were open on the 17th of January, 1907?

A. I am quite positive that they were not.

Q. Are you positive they were closed on the 16th day of January, 1907?

A. Equally so, I say I know of no special emergency whatever that would require their having been opened.

Q. The pressure from the works at 42d Street is not as great as that from the works at 44th Street, is it?

A. No, it is not.

Q. So that if point 6, 317 West 42d Street, had been supplied from the 42d Street works, the maximum pressure registered at that point would have been less than was as registered upon this chart, Plaintiff's Exhibit 346, would it not?

A. I can't answer that without referring to the other profile.

Mr. **Mathewson**: It would be nearer 42d Street station than to 44th. You would have to account for that proposition.

Mr. **Kirby**: About one block.

Mr. **Mathewson**: Yes.

6242 A. I believe there would be a very slight difference in pressure if that were done.

Q. And a decrease in the maximum?

A. A very slight decrease. A difference of .2 between district pressure and works pressure at that time, five o'clock, the maximum.

Q. Do you know the average size of the service main at which the services going to point 6 of Exhibit 346 was attached?

A. 16-inch main.

Q. And is 16-inches the usual size of your service main?

A. There are a great many mains, service mains, possibly not above 16 inches in diameter, but it is not an unusual condition at all.

Q. How long is that 16-inch main? Starting at the works I presume it runs to what point?

A. My recollection of that 16-inch main is that it starts at the works and runs down to either Tenth or Eleventh Avenues and east on the north side of 42d Street.

Q. And through 42d Street to what point?

A. It continues right east in 42d Street I think to Lexington Avenue or Third Avenue.

Q. And then down Third Avenue?

A. It connects into a main that is running down Third Avenue, possibly. I am not sure that it does continue to Third Avenue. If it does continue it evidently connects into the 16-inch main which runs down Third Avenue.

Q. And there is no smaller main upon 42d Street?

A. Yes.

Q. From which the services were taken?

A. Of that station?

Q. I mean from this station?

A. The point supplied from that station? That I don't know. I am not sure.

Q. In other words, it is your impression that you connect your services all into this 16-inch main which runs across 42d 6243 Street to Third Avenue, and then goes into a main of the same size running down Third Avenue?

A. I know we connect our services into it; the mains generally on the chart are connected into it so it is therefore a service main.

Q. Do you know of any other mains from those works connecting into the 16-inch main on Third Avenue?

A. I believe there is another main going east in 46th Street from the works which connects into the same 16-inch main at Third Avenue.

Q. The size of that main running through 46th Street is what?

A. 30 inches.

Mr. Mathewson: He said he wasn't sure that this did connect with the Third Avenue main.

Q. It appears by Exhibit 346 as 12 inch; which is correct?

A. You have asked me about——

Q. I am not sure about this—I am not trying to mislead you at all. Is that black (indicating); is that 30 inch?

A. That is black.

Q. Is that black?

A. That is black, yes.

Q. Then your impression is that there are two mains running from the 44th Street works across to Third Avenue; a 30-inch main through 46th Street and a 16-inch main through 42d Street?

A. Yes, sir.

Q. And this 16-inch through 42d Street had directly connected to it the services upon which you took the readings of point 6, being 317 West 42d Street?

A. Yes, sir. Regular service main, service connected to it at that point.

Q. Now, will you take the pressure as given at point 5, being 4 Irving Place, and tell me if I am right in stating whether the maximum of that reading is 2.6 inches.

A. You are right, yes.

Q. And that if that maximum point were brought down to 2½ inches the minimum would then be as high as 1.9 inches?

A. It is impossible to state that. The maximum that you
6244 refer to is during the hours of least consumption, it is only
for a momentary peak, and the minimum you refer to is the
lighting hour.

Q. But if there were a general reduction of the pressure taken at this point of .1 of an inch the maximum would be 2½ and the minimum 1.9, would it not?

Mr. Mathewson: If you are assuming the reduction would be uniform all the way through after you reduce the pressure at any single point——

Mr. Kirby: I am.

A. Assuming that, yes.

Q. And we will take point 2, 487 Broadway, indicated by the blue line, I find the maximum for that is 2.2 inches?

A. Yes, sir. No, I guess we were higher than that there.

Q. It is 2.4?

A. Yes.

Q. And the minimum for that is 1.45 inches, so that if you drop the minimum reading at point 2, 487 Broadway, down 1-10th of an inch, that reading would still be as high as 1.35, would it not?

A. If you drop this peak only.

By Mr. **Mathewson**:

Q. What peak?

A. (No answer).

Mr. **Kirby**:

Q. If you drop the peak indicating the minimum reading at Broadway during the 24 hours, at No. 487 Broadway, being point 2 upon Complainant's Exhibit 346?

A. The pressure would then be 1.35 inches.

6245 Q. If we take point 3, being No. 5 Second Avenue, indicated by the green line, we find the highest pressure during the 24 hours is 2.25 inches?

A. That's right; yes, sir.

Q. If in this case we drop the minimum 1-10th of an inch we still have reading of 1.4 inches as the minimum?

A. That is correct.

Q. If we take point 7, being 108 West 34th Street, indicated by the yellow line, we have a maximum of 3.1 inches, have we not?

A. That is right.

Q. And a minimum of 2 inches?

A. That is right.

Q. And if we drop the maximum point to 2½ inches, that is .6 of an inch, our minimum point would be 1.4 inches, would it not?

A. It would be if we were dealing with that pressure alone and could deal with it alone and not consider these other pressures that would be affected at the same time.

Mr. **Mathewson**: What would become of your other pressures, Mr. Kirby?

Mr. **Kirby**: I think I understand, Mr. Mathewson. I think we will make it very clear even to you.

Q. If you take point 8, indicated here by the violet line, we find the maximum to be 3.35?

A. 3.35.

Q. And the minimum of that violet line is 2.1 inches?

A. Correct.

Q. Now, if you drop that maximum down to 2½ inches, which would be 8.15——

A. That is right.

Q. Our minimum would be 1.25, would it not?

Mr. **Mathewson**: That is another matter, Mr. Kirby, entirely.

A. Assuming an entirely impossible condition, it would be, yes. I have to assume that. My own experience teaches me that it cannot be done. Putting it that way, it would.

6246 Q. The points of which I have just made reference, outside of points 6 and 4, point 6 is 317 West 42d Street is close proximity to the works, and of which we have spoken, and point 4 is 879 Eighth Avenue, being at the corner of or close to 55th Street, and took the point 8, at 119 East 47th Street, which is the highest maximum reading, and dropped all of the pressures at these points, with the exception of points 6 and 4, so that the maximum reading at point 8 is 2½ inches, is it not, a fact that the pressures at all of these points are within 1 and 2½ inches?

A. I understand by that that you eliminate these two pressures Nos. 2 and 3.

Q. I do not. I yield 6 and 4.

A. And you ask me if by dropping the pressure indicated by the line No. 8 in violet——

Q. Yes.

A. To a point that would bring it under——

Q. No, to .25.

A. That all the pressures would be within 1 and 2½ inches?

Q. Yes?

A. No.

Q. Now, point 3 would be how much below one inch?

A. Impossible for anybody to say.

Q. Point 4 would be how much below one inch?

A. That is impossible, too.

Q. In other words, you are not prepared to state that if the pressures at the point from which the gas is sent into any district, the pressure at the point from which came the gas sent into any district, were reduced so that the maximum reading in that district were brought down .5 of an inch that the readings at the other points in that district would not be correspondingly decreased?

A. I am not prepared to say that at all. The conditions vary, the conditions of consumption, the points are all scattered throughout the districts, the same conditions cannot possibly apply. A 6247 reduction might be effected of ½ inch at one point and it does not follow it would be so effected at another point in the district.

Q. Then how do you endeavor to regulate pressure to keep within any limits whatever?

A. By endeavoring to maintain a predetermined pressure at some point in the district, keeping the pressure at that point entirely uniform or as near uniform as can be kept, and having that point so located that it will be to a certain extent the indication of the pressures throughout the balance of the district supplied.

Q. Will you point out to me on these exhibits that point?

A. I will.

Q. Take Complainant's Exhibit 346?

A. The pressure maintained on this district by means of an electric indicator is shown by line No. 5.

Q. That is No. 5 Second Avenue?

A. No, it is 4 Irving Place, if I have not misread it.

Q. 4 Irving Place—you are right.

A. The line follows here (indicating).

Q. Now, we will assume that the pressure at 4 Irving Place during this day instead of having a minimum of two inches had not by your electrical indicator shown to you to be as high as that and was brought down so the minimum would be one inch, what effect would it have on the rest of the system?

A. That is only a matter of speculation. I believe that the effect on the rest of the system would be to reduce that comparatively to the same amount as indicated there now, taking that point as the guiding point.

Q. And if that had been done would the readings at No. 4 Irving Place have been 1 inch and 2½ inches?

A. If this peak had been brought down to 1 inch?

Q. Yes?

A. It would.

6248 Q. And would the readings at any of the other points in the district have been brought down?

A. They would.

Q. How would you have reduced the pressure at 4 Irving Place; by reducing the pressure at the 44th Street station?

A. Yes, sir.

Q. Then I was not speculating quite so much after all, was I?

A. You have not considered bringing the pressure of four inch to one inch. You are bringing this down to practically nothing. It is something we cannot determine. Below one inch at any rate. I have said it is impossible to determine just what the fall would be. By taking some other point, I believe we can approximate it by taking the central point on which we are now regulating, but that is not the one you refer to.

Q. The place of reduction of pressure is the point at which the gas goes out and that is what we were having reference to when I asked the question.

A. I did not understand that that was it.

Q. Now, turn to Complainant's Exhibit 347 which states that—that gives the territory supplied by the 42d, 63rd and 65th Street stations. Is there any method by which you can state what section of this territory is supplied by any one of these stations?

A. No, there is not.

Q. Do the pipes *form* any one of these stations interlock the pipes from any other station?

A. From the same general arrangement I have already described, yes.

By Mr. Mathewson:

Q. What do you mean, if you do not mind stating? I am not clear on that?

A. Well, I can probably make it clearer in a general way. The territory supplied by the competing companies, the old constituent companies of the Consolidated Gas Company, were regulated 6249 by certain boundaries in certain parts of the city and since that time an effort has been made to connect the various main systems up so as to reduce the areas supplied by any one station, with the idea of forming as far as possible a more uniform pressure regulation throughout that district.

By Mr. Kirby:

Q. You do not seem to have been very successful at point 4 on this map, being 145 West 69th Street, do you?

A. That is a point near the works where it is necessary to carry a high pressure in order to maintain satisfactory pressure at other points throughout the district.

Q. Do you know the size of mains from which the service at point 4 is taken?

A. I do not.

Q. You do not know whether it would be possible to supply point 4 from 42d Street?

Mr. Mathewson: Run a special main, I suppose.

Mr. Kirby: Yes, you might have to run a special main.

Mr. Mathewson: Yes. That would make a capital expenditure if we proceeded on that basis that would make gas cost five dollars.

Mr. Kirby: Yes, it might cost ten dollars, but it is not likely.

Mr. Mathewson: It would be quite likely.

Mr. Page: Under New York conditions.

Mr. Mathewson: Yes.

A. That point already is in the district which is to a certain extent supplied by the 42d Street station.

Q. But it is close to the 63rd Street station?

A. Oh, yes, just north of 65th Street station.

6250 Q. Yes, 65th Street station; and so, as you have just stated, the main to that immediate district comes from the holder at 65th Street?

A. Yes, that's right.

Q. And point 9, 145 East 65th Street, shown by the orange line, is practically under the same conditions as point 4, is it not?

A. Point 9 is at the corner of 65th Street and Lexington Avenue.

Q. And is there a transverse main or is there a supply main which runs across to 65th Street?

A. There is, yes, sir.

Q. And that main is of the size of 20 inches?

A. It is.

Q. And when it reaches Second Avenue it branches off and runs down that avenue as far as 34th Street?

A. Is it so shown in the map?

Q. Yes.

A. Yes.

Q. Where is the point in this section shown by Complainant's Exhibit 347 where you take the pressure readings to give you an indication as to whether or not the pressure throughout the system is greater or less than it should be?

A. Where is the point?

Q. Yes.

A. Point 10; 565 Park Avenue.

Q. Indicated by the yellow line?

A. Yes, sir.

Q. Now the maximum pressure at point 10 during the 24 hours was 2.6 inches, was it not?

A. It was.

Q. And if that pressure had been uniformly reduced .1 of an inch throughout the entire 24 hours, is it not a fact that the only points which would have been at any time above 2½ inches or at any other time below one inch, point 4 being 145 West 69th Street, to which we have made reference, and point 9, 145 East 65th Street to which you have also made reference?

A. No, sir, there is another point.

Q. Which one is that?

A. This one.

6251 Q. What is that?

A. The pressure at 420, I think the number is—408.

Q. 408 East 63rd Street?

A. That is right.

Q. And 408 East 63rd Street is upon a 36-inch main running from the works——

A. It is attached to this main here, 20-inch.

Q. That is point 9?

A. 408 East 63rd Street is right here (indicating); that is attached to the 20-inch main.

Q. Well, whatever it is. And point 11 is at a service running from the same 20-inch main as that to which the service of point 9 is connected?

A. It is, yes, sir.

Q. Now, I presume that in the pressure readings taken in this section, as in the readings taken in the other sections, you made no general inquiry as to whether any gas was being taken off by consumers on the service to which you had your pressure gauge attached during the time in which the readings were being made?

A. I made no special inquiry for that purpose; the services are all in use to a certain extent.

Q. Now, we come to Complainant's Exhibit 348, stated to indicate the territory supplied by the 14th Street station, that station being at 14th Street?

A. I want to correct that map before it goes any further. They have inadvertently marked "23rd Street," and the proper boundary should be 34th Street.

Q. From the plotting of the territory stated to be supplied by the 14th Street and East River plant I notice that your mains run clear across the city as far west and further west than Tenth Avenue, so that the part of the territory adjacent to Eleventh Avenue and Twelfth Avenue and 14th and 15th Streets, and further north are supplied by these works; is that so?

A. That is so, yes.

6252 Q. Now, I notice that you have put in evidence here no territory such as might be supplied by the holders at 18th Street. Does the gas from the 14th Street station supply the district contiguous to the 18th street holders?

A. Yes, it does. The 18th Street holders at present are merely used to back up the pressure in the mains at certain hours of the day, and are not a very important factor in the pressure regulation.

Q. And then adding this marginal street on the north of 34th Street we find that the section served by these works is in some parts the same as that served by the 44th Street works?

A. In parts, yes.

Q. Upon this exhibit we have readings given at point 7, being 609 East 14th Street, and to which we made reference in examining the chart showing the territory supplied from the 44th Street works. The reading at point 4, being 148 West Houston Street, was taken upon the service attached to what size mains?

A. I don't know.

Q. I note by reference to the key upon this chart that the 18-inch main is indicated by a red line with a green line thereon.

A. That is a broken red.

Q. A green line?

A. Yes, sir.

Q. Is the line which runs along Houston Street and Wooster Street an orange line? Or what size main is it? That is what I am after, and I cannot tell from here?

A. What street?

Q. On Houston and Wooster Street-?

A. I don't find Houston Street is down here.

Q. Hudson Street and Wooster?

A. In Hudson and in Wooster those are both 16-inch mains.

Q. Where is the point in this district where you take those pressure readings by which you judge the pressure to be supplied to the entire district?

A. Those are regulated to a certain extent by an indicator at No. 4 Irving Place also.

Q. Well, by that you mean the readings indicated by the red line on this chart?

A. The red line.

6253 Q. Now, the readings taken at point 3, 420 East 18th Street, are upon a service attached to what size main?

A. That is attached to a 16-inch main.

Q. Which main runs clear across the city to Tenth Avenue, does it not?

A. Yes, not full size—it reduces to 12.

Q. If the pressures at 4 Irving Place indicated by the red line were reduced so that the maximum would be less than that which is here indicated by .35 of an inch, would that not with a corresponding reduction of pressure throughout the system——

A. Do you mean three and one-half tenths?

Q. Yes; bring the readings at one point, point 7, which is 609 East 14th Street, and point 3 which is 420 East 18th Street, so that at no point would you be higher than 2½ inches or lower than 1 inch?

A. Assuming that it could be done, yes.

Q. Now, turning to Complainant's Exhibit 349, I ask if you can tell me the size of the main to which a service was attached supplying point 4, being 408 East 63rd Street?

A. That is the same point that appears on the other chart, 20-inch main.

Q. Coming to Complainant's Exhibit 350, I find that those questions which I would ask you in reference to point 3, 317 West 42d

Street, I have already covered in the examination of the other charts so I won't take up the time of repeating them now. Coming to Complainant's Exhibit 351, showing the districts supplied from the Inwood station, I note some rather interesting elevations stated upon it. For instance, we have here point 1, 185th Street and Fort Washington Avenue, indicated by the brown line, which is the line giving the minimum reading, having an elevation of 270 feet. Let us assume that point was at mean sea level rather than 270 feet.

Mr. **Mathewson**: In other words, bring it down to the Hudson River?

6254 Mr. **Kirby**: Yes, we will take it down to the Hudson River. That is pretty close to sea level at that point, I guess.

Q. And I ask you if you do not consider that the pressures as shown by this chart would have been greatly in excess of those as they are here set down?

A. The question is not entirely clear to me.

Q. Well, we have a pressure here, we will go at it in another way. We will get at it. The minimum pressure shown by the brown line is .7 of an inch?

A. Yes.

Q. Now, an elevation of 270 feet, I take it, would produce a pressure in such illuminating gas as furnished here in the city of about 1.35 inches, would it not?

A. As compared with a main at sea level?

Q. Yes.

A. More than that.

Q. Well, how much would it be?

A. Well, you have to assume specific gravity to calculate properly.

Q. Well, assume specific gravity. You are familiar with the distribution of gas and matters of that kind. Assume we have an elevation of 270 feet and we will assume that you are taking pressure readings at sea level and another one at 270, and there is nothing except elevation to assist in the pressure, and I ask you what it would be at 270, as compared with sea level?

A. About 1.6 inches.

Q. Then if there had been no elevation at this point, and the conditions otherwise had in no way influenced the reading, our reading instead of being .3 of an inch would have been what?

A. .3 of an inch?

Q. That is right, isn't it, .3?

A. .7.

Q. .7 inch?

A. The reading would have been what had that happened?

Q. Yes.

A. As I understand your question you simply eliminate 6255 this pressure chart and place that particular point down at sea level?

A. That is all. And it would reduce it from its present pressure as shown there by 1.6 inches at that point only.

Q. And are these other points indicated by the various elevations—129.70 and 201.67 feet, in the same proportion, that is, the proportion which they bear to 270, 270 having a pressure of 1.3 inches; is that what you gave these?

A. The pressure at the height of 270 feet, is 2.9 inches at the time stated. The loss would be 1.6 inches by reducing the elevation from 270 feet to zero.

Q. And the loss in the other instance would not be as great, but would be in the proportion which the elevation of those other points bears to 270 feet, the elevation of point 1?

A. The loss would be in direct proportion to their elevation above sea level.

At 1 P. M. a recess was declared until 2:15 P. M.

After Recess.

Oscar H. Fogg resumes the stand, and further testifies:

Cross-examination by Mr. Kirby:

Q. I notice that you took pressure readings at the corner of 120th Street and Broadway, being the readings marked in violet on Exhibit 345?

A. Yes, sir.

Q. Do you know the elevation at that point in respect to the elevation at Columbia University?

A. That is at the Columbia University in one part.

Q. That reading was taken upon a service connected to what main?

A. The main on the Broadway side.

6256 Q. Looking again at Exhibit 345, let us suppose that a consumer at point 5, being 176th Street and the Boulevard, desires to cook an evening meal at 4:45; what would have been the operation of a gas stove from that time until quarter of six, the pressure between those times varying from .9 of an inch to .7 of an inch?

Mr. Mathewson: Isn't that rather an extraordinary question? This man is not qualified as an expert on gas stoves and how long it would take him to cook a steak, I suppose, with the pressure varying like that. Is not that question outside of anything this witness has testified respecting? I think so. I think I shall have to object to it as speculative and not proper cross-examination.

Mr. Kirby: If he does not know he can say so. If he does know I would like to hear.

Mr. Mathewson: I do not think it is cross-examination if he did know.

The Master: He may answer it if he knows.

Q. Do you know?

A. No, I do not.

Q. You have stated you are acquainted with the subject of gas distribution in Yonkers and other different localities. Have you noticed such extreme variations in pressure exhibited upon the charts which have been put in evidence here; have you noticed in these localities such extreme variations in pressure?

A. Yes, I have.

Q. And has there been any effort on your part or on the part of those connected with the companies that you were then associated with to correct such variations?

Objected to as immaterial and irrelevant.

Question allowed. Exception.

6257 A. As a matter of pressure variation, an effort has always been made to reduce the variation in pressure as far as it was possible to do so.

Q. From such experience and such reading as you may have done upon the subject, do you gather that it is advocated; that any such extreme pressure on the mains as shown in these charts, do you gather that it is advocated?

Mr. Mathewson: By whom?

Q. By those in charge of the companies with which you were connected or by the authors of such text books as you may have read upon the subject?

A. No. Pressures appear on our charts which are necessarily in excess of what would be considered an efficient and satisfactory pressure. Because of the proximity of the points to the works, the conditions of elevation, their regularities of consumption, those higher pressures occur.

Q. Have you, or has the Consolidated Gas Company to your knowledge, ever made any use of district governors for the purpose of regulating pressure?

A. They have not, to my knowledge.

Q. I believe you were present when Mr. Forstall testified, were you not?

A. I was, yes.

Q. You heard the testimony of the effect of pressure upon the efficiency of the use of gas, did you not?

A. I did not follow it very carefully. I have heard his testimony in a general way. I don't know that I recall that.

Q. Is it your opinion that any of his suggestions about check burners, by turning down burners, would effectually protect the consumer against waste of gas at such high pressures as shown in your charts?

6258 Mr. Mathewson: That is objected to as altogether too general. If you desire to call the witness' attention to any particular statement of Mr. Forstall's and ask him if he agrees or disagrees with this one proposition, do so, but to deduce what the conclusions were and ask whether he agrees with general conclusions that you state, I do not think it is proper or fair.

The Master: I think that is a fair suggestion, Mr. Kirby, so long as the record is printed.

Mr. Kirby: It won't take long to get at it.

Q. I call your attention to Complainant's Exhibit 348, and especially to point 7 thereon, being 609 East 14th Street; there the variations in pressure are shown by the violet line, and where between the hours of 4:30 o'clock in the afternoon the pressure rapidly decreases to 3.35 inches, and then as rapidly within the next half hour increases to 4.7 inches?

A. The next hour.

Q. 33.5; then within the next half hour increases to 3.5 inches, then in the next half hour rapidly rises to 4.7 inches, then within the next fifteen minutes drops to 4½ inches, then remains constant for half an hour, then within the next three-quarters of an hour rises to 4.65 inches, from 7:30 to 9:30 remains practically constant at 4.7, then within the next half hour rapidly drops so that at ten o'clock it is at 4.35 inches, then in the next half hour to 10:30 drops to 3.55 inches, the next half hour again rapidly drops to 2.8 inches.

Q. Now, I ask you, assuming that the consumer had his burner properly adjusted by turning the stop cock, so that it was giving efficient light at half past four, what sort of a light would he have during the hours from half past four to half past ten if he did not make any adjustment to his stop cock.

Mr. Mathewson: If he did not exercise intelligent, common sense, in other words.

6259 Mr. Kirby: We will assume that that is what it is, if you desire to.

Mr. Page: That is, that he should exhibit the common sense which the gas company fails to exhibit.

Mr. Mathewson: And which the gas company cannot possibly exhibit.

A. I can't tell you what sort of a light he would have. His gas pressure at that point is necessarily subjected to the extreme variation, because of the extreme variations that occur in that district, because of its proximity to the works.

Q. Now, do you not consider that that variation would be less if the service were attached to other than the large-size main to which you have testified it is attached?

A. If there is another main there which carries a less pressure.

Q. Do you know whether or not there is another main there which carries a less pressure?

A. I don't think there is another main there—another district main there supplied by that station.

Q. You are not prepared to state that there is no other main there supplied from some other station, say the 44th Street station?

A. I have already stated that I do not believe the mains of the 44th Street station on that street go to Second Avenue.

Q. Might there be mains there from some other station than either 14th or 44th?

Mr. Mathewson: He says he does not know that there are.

Mr. Kirby: I have not asked him that question yet. If he does not know he can say so.

A. I don't know that there are.

Q. Now, we will assume that the consumer at this point is
6260 displaying this great degree of intelligence which has been
called upon——

Mr. Mathewson: Very slight degree.

Q. (Continuing.) Which is the standard set by Mr. Mathewson, which we will assume—he has fixed his meter at half-past four so that it is giving the proper illuminating efficiency, and will you tell me how many times he would have to adjust his cock on his burner so that it would continue at that efficiency until the hour of eleven o'clock, when we will assume he goes to bed?

A. No, I can't tell you that.

Q. Well, wouldn't it be at least thirteen times?

A. I should not consider it so. If you are prescribing for the highest efficiency and a very careful test of gas, where the most minute regulation is desired, he would have to change it as often as the pressure varied. I don't think that condition obtains anywhere in practical use.

Q. Then this point here is a most unusual and extraordinary point of pressure variations?

A. This point here (indicating).

Q. This point 7, 609 East 14th Street?

A. It is the general condition at points in close proximity to the works.

Q. So that if those intelligent consumers within close proximity of the works are to have an efficient illuminating power from their flame they would be jumping up and down thirteen or more times during the evening to adjust their flame.

Mr. Mathewson: You are assuming something that is not shown at all.

A. I don't think they would.

Q. Well, how many times? Here is the chart. You have heard Mr. Forstall tell us about how a man could go up and adjust his cock,
and what the pressure would be, and no matter what it is in
6261 the distributing main he can adjust it by turning down the
cock. Now, I will start at the time he has done that and goes and sits in an armchair and smokes a cigar, and what not, and the pressure goes up over an inch——

Mr. Mathewson: You also heard his testimony that those checked burners would work with pressures from 1 to 3 equally well.

Mr. Kirby: Yes.

The Master: Well, gentlemen, let the witness dispose of it.

Mr. Page: We are talking about adjusting it at the cock now.

A. You asked me a question that it is impossible to answer properly. In the first place, too much has to be assumed. None of us know that the man at this point is consuming gas at the time this variation in pressure takes place.

Q. Well, assume he is.

A. If he is not using gas it does not affect it.

Q. We will assume he is using gas.

A. If he is using gas at the time that the pressure is at its lowest point here I would say that he would get a fairly satisfactory condition if he had lit his gas at that time, and when the extreme hour—

the greatest increase came on, if he adjusted his burner at that point and left it alone——

Q. And left it alone when the decrease came afterwards?

A. Well, the decrease would not have started to come until half-past-nine at night and would not reach the lowest point until between eleven o'clock and midnight—about a quarter of twelve.

By Mr. **Mathewson**:

Q. He might be in bed that time, might he not?

A. I would expect him to be there.

6262 Mr. **Page**: There are some of us who sit up after half-past nine.

By Mr. **Kirby**:

Q. And so you would allow this intelligent man to sit in his chair while his gas increases in pressure from 3.25 inches to 4.7 inches?

A. I would not.

Q. When would he get up? When would he adjust it?

A. He would get up when he noticed——

Q. When would he notice it?

A. When he looked at his light and it was apparent to him.

Q. When would it be apparent to him?

A. At any time the pressure was increasing, probably. We will presume he is an intelligent man.

Q. At what point would it be apparent to him? We have this very large increase of nearly .2 of an inch? At what point along the increase would an intelligent man notice that?

Mr. **Mathewson**: Objected to on the ground that counsel is examining the witness on the subject of candle power, in which subject he has not been qualified and in which subject he has not testified to anything on my examination.

Mr. **Kirby**: I am examining on the point of the intelligent man.

Objection overruled; exception.

A. It might become apparent at any point between its lowest and its highest.

Q. And if it did then he would get up and turn it down?

A. I would expect him to, yes.

Q. If he were extraordinarily intelligent it might go up .2 of an inch and he would notice it?

A. If he were, yes.

Q. And he would get up and turn it down, and having that intelligence on the next increase would he not have another turning down? 6263

A. Providing he was sufficiently intelligent to note .2 of an inch variation, to note it on an ordinary open tip.

Q. So if he turned it down every time it increased .2, instead of being 13 times it would probably be 130?

A. No, I don't think so. There are not 130 variations of .2 during the lighting hours, on the chart.

Q. Well, I count 20 here. Did you make pressure readings on any other days than January 16th and 17th?

A. We take pressures at the points you have seen here, every day.

Q. And are these points well settled ones, where the tests are taken?

A. They represent the average conditions, yes.

Q. Have you any purpose in picking out these points instead of other points in the district?

A. None whatever.

Q. Do you endeavor to pick out points where the best or the worst conditions are shown?

A. No; merely to show the general conditions applying to the district.

Q. I presume that you endeavor to regulate other points?

A. Yes.

Q. And that being so it would be an effort to ascertain how great a maximum or how great a minimum there might be in the entire district?

A. Yes. We try to keep fully informed of pressure conditions throughout the district.

Q. So you would naturally seek to find a point where it would give you the greatest pressure in a district and also the point which would give you the least pressure in the district, would you not?

A. It would be far more important, and we do make a greater effort to keep in touch with the lowest points on the district than we do the higher.

Q. You also endeavor to keep in touch with the highest?

6264 A. We endeavor to keep in touch with all of them.

Q. When you say that these charts here probably show where the points were, you mean the lowest and the highest points where you would have the highest pressure in the inspection districts?

A. I think they would, in a general way, yes. There may be points where the pressure- are lower and there are undoubtedly points where the pressures are higher than shown on these charts. It does not amount to much I believe in either case what little variation or what difference between the points that we give would be.

Q. Have you the charts, Mr. Fogg, by which you plotted the curves on these exhibits?

A. I have.

Q. Will you let me see one of them, please?

A. Which one?

Q. The one we have before us is Complainant's Exhibit 348. Suppose we take the "intelligent-man" point, 609 East 14th Street, Point 7.

(Witness hands counsel a chart).

Q. The witness hands me a disc chart, which is from Bristol's recording pressure gauge?

A. That is right.

Q. And the red line upon which indicates the pressure reading at

Point 7 of Complainant's Exhibit 348, being 609 East 14th Street; that is correct, is it not?

A. That is correct, yes, sir.

Q. I notice upon this chart certain other minute variations. Have those minute variations been plotted upon this Complainant's Exhibit 348?

A. They have not.

Q. What have you done where——

A. We have plotted the mean or average pressure line, also disregarding the very rapid fluctuations of .3 to .4.

Q. Now, I notice here between the hours of five P. M. and
6265 six P. M. at least seven variations of over one-half of a tenth
of an inch, do I not?

A. Half of a tenth?

Q. I read the scale wrong. About .7 of an inch, do I not?

A. Yes.

Q. Are they indicated upon Complainant's Exhibit 348?

A. The chart exhibit 348 shows the pressures at the quarter-hourly points throughout the entire twenty-four hours—such variations as may occur between the fifteen minute points are not plotted or are not recorded at all. It would complicate I think the profile to such an extent as to make it useless to show what we have endeavored to show.

By Mr. Mathewson:

Q. You just treat your lines between the quarter hour points?

A. Simply taken those throughout the day.

By Mr. Kirby:

Q. So the variations during a period of fifteen minutes would not be shown, as set down upon the Complainant's Exhibit?

A. Any variation that might have occurred would not have been set down.

Q. And, as we have just found by referring to the chart from Bristol's record pressure gauge, such variations did occur in those instances?

A. If they occurred between the quarter-hourly points.

Q. They do, don't they?

A. These variations here, you mean?

Q. Yes.

A. You mean this uniform line of variation?

Q. Yes.

A. Oh, yes. Of course, that is constantly occurring.

Q. Do you know what occasions that constant variation?

A. No, I don't know definitely that in that case.

6266 Q. Do you know where this point is situated?

A. Yes, it is right close to the works.

Q. And you noticed between the hours of eleven thirty at night and five thirty in the morning there is practically no such jiggling or minute variation?

A. I do notice that, yes.

Q. Does that give you any clue as to what those minute variations might be due to?

A. I would say, from my observation of the charts entirely and without knowing the conditions within the works, that I believe it to be the variation produced by the unusually heavy draft upon the outlet of the governor or regulating valve at that time.

Q. How much larger is the scale upon the exhibits than that upon the chart from the recording gauge?

A. You cannot make any comparison of the scale between the two. You can take them separately. The chart on the gauge, the pressure scale, increases from zero to its full capacity. The chart as plotted in the profile is at a uniform rate of increase both as to the time and as to the pressures.

Q. Well, we have the time here, for instance; it is indicated along that curved line?

A. Yes, sir.

Q. And presumably the distance between each of the circular lines representing the pressure is the same, is it not?

A. I think you will find that on the first 15/10ths or 18/10ths the scale is just a trifle finer, a little more so than could be measured with a rule on the chart which you hold there. I had in mind a 20/31 chart. We have two types. The charts you have there is uniform all the way around as to the pressure divisions.

Q. In this uniform chart, which is the one to which we have been making reference, you have increased the scale upon the exhibit about how many times?

A. My whole chart has been increased in proportion a number of times.

Q. Twice, three, four, nine times?

6267 A. It is hard to say. I have not made any effort to increase it with any direct reference to this at all.

Q. In taking it off you must have known the number of times of increase so as to know——

A. We read here on the chart; we have made it a uniform rectangular scale here (indicating).

Q. And simply drawn straight lines between the points you plotted?

A. The points plotted have been connected for the sake of reference by a straight line, a point as mentioned here and at the half-hour the same; they are simply connected by a straight line to show the general tend of pressure at that time. Otherwise the points would merely appear as dots, and be hard to read—could not be read.

Q. Mr. Mathewson asked you yesterday (p. 6204): "Q. Mr. Fogg, was your attention drawn to Mr. Edgerton's testimony in reference to pressures that he took at certain points, and his argument that the pressure within the district or any particular district would be found within the boundary of 1.5 inches, or might be? A. Yes, it was." I call your attention to Mr. Edgerton's testimony, which you have stated that you read, and ask you if you can point out therein any results of the pressure taken by him which differ in any material way from those taken by you—you have read the testimony, and I take it you are familiar with what he testified to?

A. Yes, I think I read the greater part of it, of these dates. I have not seen any further testimony since. You ask me if from what I know of his testimony, the method of pressure taken——

Q. No, whether you, from his testimony and the pressure readings which he has placed in evidence, found any material difference from the pressure readings taken by you?

Mr. **Mathewson**: He only put in one or two points, or such a
matter, and he showed the pressure he got at those points.
6268 This witness has not testified that those pressures as he took
them were not correct. We can keep our pressure at one
point undoubtedly.

Mr. **Kirby**: I think the witness understands the question, and I think you do, too, Mr. Mathewson.

Mr. **Mathewson**: It seems to me quite obvious.

A. You mean the pressures we have taken at the same points that Mr. Edgerton has taken.

Mr. **Kirby**: Will you read the question, Mr. Stenographer?

The **Stenographer** (Reading): Whether you, from his testimony and the pressure readings which he has placed in evidence, found any material difference from the pressure readings taken by you.

A. Why, I don't see how any comparison can be made between them at all. Mr. Edgerton has taken pressures at five or six or possibly seven points, I think only five upon the Consolidated. If you want me to compare the conditions right at those particular points I can probably do that, or try to.

Q. Have you done so?

A. Yes, in some cases.

Q. And what do you find?

A. At those particular points I find the pressures are about as he has indicated them.

Cross-examination by Mr. **Burr**:

Q. Does the black line on Exhibit 349, showing the pressure at 408 East 63d Street, represent a main used for services?

A. It does.

Q. Now, you have shown on the mains to which services are
directly attached wide variations in pressure readings from
6269 .22 to .59 of an inch from 3 P. M. to 7 P. M. at 408 East 63d
Street?

A. Throughout the district? Yes, sir.

Q. Isn't that an exceedingly poor regulation?

A. I shouldn't consider it so.

Q. Are not these wide variations of pressure able to be corrected by using mains adequate to the demands upon them; that is, large enough to care for the draught at all points, without a variation greater than 1½ inches?

A. I believe if it were possible in any place to instal a main system that is theoretically perfect, the variations could be materially reduced.

Q. If I understand correctly, it is the variation in the pressure which makes the trouble for the intelligent consumer that we have been referring to, is it not?

A. Yes; if he considers it trouble.

Q. And can these variations of pressure in your opinion be obviated?

A. They cannot.

Q. You referred to the conditions of elevation, and I notice on these exhibits a note at the foot of each one reading: "Red figures at stations as shown on disc scale; usual elevations above mean high water." What did that mean?

A. That means that most of our *guages* are located at the street level or very close to it. That means that we have gotten from city records—the Highway Department—elevations throughout the city above mean high water and that we have plotted them as a convenience for reference on the map in red figures.

Q. Has it been your custom to plot these pressures taking into account the elevation at various points?

A. Correcting for the elevation and reducing the pressure?

Q. Yes.

A. No, sir.

Q. Referring to Exhibit 346, can you state how far it is from the 44th Street station to point 2 at 487 Broadway as shown on that map?

A. I cannot state definitely how far it is, no.

6270 Q. Well, approximately?

A. Oh, I would only have to guess for that. I would say two and one-half miles, maybe three.

Q. How long would it take a point as far away from the distributing station as No. 2 on that map to be influenced by a change in pressure at the distributing station?

A. It would respond almost immediately to any change.

Q. You stated in your direct examination yesterday that the pressure at some points decreased while at other points it increased,, did you not?

A. Points in one district, yes, I did.

Q. To what extent did any difference depend on the distance of the testing station from the distributing station?

A. Oh, I don't know that it depends upon the distance at all. I think it depends more on the consumption.

Q. Comparing the points 7 at 108 West 44th Street and 8 at 119 East 47th Street, how far is each of these points from the distributing station at 44th Street and the North River, approximately?

A. I should say that point 8 at 119 East 47th Street is probably a mile from the station. It is the difference between Tenth Avenue and Lexington.

Q. Are not these distances nearly the same?

A. Yes, I think they are, within a comparatively short distance.

Q. Now, by referring to this Exhibit 346, you will notice for the entire twenty-four hours on January 16, 1907, the pressures at these points were almost identical, were they not?

A. There is not very much difference between them—a matter of .2 in the lighting hour.

Q. Comparing the pressures at these two points with the pressure at the distributing station, did you not find that the pressure at these two points varies directly with the pressure of the distributing

6271 station, excepting that the pressure is relatively less at these far-off points and that the change of pressure takes place a little later due to the distance from the distributing station?

A. Referring to these two points we have been talking about?

Q. Yes.

A. Yes, I think they do.

Q. Comparing station point 2 at 487 Broadway, and point No. 3 at 5 Second Avenue, how far is it from the 44th Street station, approximately?

A. 487 Broadway I have already guessed at. That is only a guess.

Q. By comparison with the other station?

A. I think if anything 487 Broadway is a trifle further from the works than 5 Second Avenue.

Q. Do you not find that the point 2, which is a little further from the distributing station than point 3 has at its minimum point a lower pressure than point 3?

A. About half a tenth, yes.

Q. Do you not find from the chart that your pressures at point 2 and point 3 were less than the pressures at points 5 and 7 at 4 Irving Place and 108 West 34th Street respectively, which points are nearer the distributing station than points 2 and 3?

A. No, sir.

Q. What were the pressures there?

A. At what particular hour?

Q. Say at five o'clock?

A. At five o'clock I find point 2 is very much lower than point 7.

Q. Make it seven o'clock?

A. Still lower than point 7.

Q. Comparing the size of the mains at points 7 and 8, point 7 at 108 West 34th Street has according to the chart a 12-inch main and point 8 has a 16-inch main, has it not?

A. There is no size of main indicated on 34th Street.

Q. What is your knowledge or intimation on the subject?

A. About the main in 34th Street?

6272 Q. Yes.

A. I don't know just what size it is.

Q. The boundaries down in this district extend from 79th Street to Grand Street and from the North River to the East River?

A. Yes, sir, they do.

Q. And this exhibit shows the pressure varies there considerably, does it not, dependent on the distance of each testing station from the distributing station?

A. In this particular case it is a fact that the lowest pressures, No. 2 and No. 3, are at the greatest distance from the works.

Q. Now, assuming that there were more distributing stations in the territory served from the 44th Street station and that the distances showed much less differences from the distributing station than at present, would not the pressures at these points show much less differences from each other than at present?

A. I don't think I can answer that question.

Q. You mean it is not clear enough or not definite enough?

A. No, not in its present form; and as I understand it I do not believe I can answer it at all. I will try to.

Q. Yes, what is the best answer you can make to that?

A. Possibly you can put it to me in a little different shape. I would not try to answer it at all as it is.

Q. Assuming there were no more distributing stations and less distance to cover, need there be less difference in pressure?

A. Would there be less difference in pressure?

Q. Yes.

A. Yes, I think there would.

Q. Now, I understood you to say a moment ago in response to Mr. Kirby that you had no experience with regulating devices. Am I correct in that?

A. In regard to the Consolidated Company's mains, you mean?

Q. Yes.

6273 A. As I remember it, Mr. Kirby asked about an automatic district governor.

Mr. Mathewson: He asked whether the company here used that, and Mr. Fogg said no.

Q. Have you had any experience at all with pressure regulation, with regulating devices of any kind?

A. District devices?

Q. Yes; automatic governors?

A. As set in some parts of the street main system away from the works?

Q. Yes.

A. No.

Q. Then you cannot say whether it is possible to reguiate the pressure of gas without impeding its flow by means of diaphragm pressure regulators?

A. I know that diaphragm pressure regulators are employed for the regulation of gas pressures.

Redirect-examination by Mr. Mathewson:

Q. You were cross-examined respecting qualifications, and I will ask you whether you were in the employ originally of the United Gas Improvement Company of Philadelphia?

A. I was.

Q. And as Constructing Engineer had you any charge of the designing or the contsruction of the distributio- system at Ocean City?

A. I designed the works and the distributing system at Ocean City, had charge of their construction, put the plant into operation there upon its completion, and was superintendent for a time after the plant was in operation.

Q. Were you in charge of street main construction for the Mt. Vernon Company?

A. Of a section of the large contract work that was done up there before their merging with the Westchester Lighting Company; yes.

6274 Q. In 1904 you were employed by the Consolidated Gas Company as engineer to supervise the construction of the 36-inch main regarding which you have testified?

A. I was; yes, sir.

Q. Between the 111th and 132nd Street Stations?

A. Yes.

Q. What have been your general duties for the company since that?

A. Since that time I have had charge of the draughtsmen and the record clerks of the department of mains and services. In addition to that I have had the gen-ral inspection of all subway and tunnel work in New York City, in particular in relation to the protecting of this company's mains. I have also had charge, as I testified, of the gauge pressure stations, of which there are seventy-four maintained throughout the city, and from time to time I have been detailed to the supervision of special work, with regard to street mains.

Q. Are you a member of the American Gas Institute?

A. I am; yes, sir.

Q. And of any engineering society?

A. I am a member of the Illuminating Engineering Society, yes.

Q. Have you ever tested these recording gauges which are used by the Consolidated, as to their accuracy?

A. Before we adopted these gauges for general use throughout the city I made a very extensive series of tests with the device that we now use to determine within what ranges of pressure they are entirely accurate, and I found that they we*er* thoroughly reliable and correct.

Q. You found that they responded instantly to variations in pressure?

A. I did.

Q. Now, as to these different divisions of the city, I understand that the divisions are separated from each other by valves or something of that sort, in normal condition, is that correct?

A. That is correct; yes, sir.

6275 Q. And is that for the purpose of equalizing the pressure or establishing districts in which you can get as uniform a pressure as possible?

A. Its purpose is to reduce the district supplied by each station in order to effect the most uniform pressure regulation possible.

Q. Have you ever claimed if you select any one particular point that you could not keep the pressure at that one particular point between 1 inch and 2½ inches range?

A. No, sir, I have not.

Q. Mr. Edgerton testified that he observed the pressures at those points that he thought likely to give the greatest difference of pressure, the highest point and the lowest, and those most remote as well as a few nearer the works; did you find that in fact he did select such points for his experiments?

A. I did not.

Q. Did you find in actual experience as shown by these charts, that the ranges of pressure were actually very much greater than he showed for those particular points which he took?

A. I did, yes, sir.

Q. And as a matter of fact the highest elevation which Mr. Edgerton took was about 136½ feet, wasn't it?

A. The elevation where Mr. Edgerton took this pressure was at Columbia University, in room 206, Fairweather Hall—that is right opposite 118th Street on the Amsterdam Avenue side. The elevation of the intersection of 118th Street and Amsterdam Avenue is 126½ feet. Mr. Edgerton stated in his testimony that the point he took was about ten feet above the street level. That would make it about 136½ feet; that is the maximum.

Q. As a matter of fact, the mains of the company supply a point of elevation of over 200 feet?

A. They do.

Q. Do you know what the elevation of 186th Street and Fort Washington Avenue is?

A. At 185th Street and Fort Washington Avenue there is an elevation of 270 feet.

6276 By Mr. **Kirby**:

Q. All set down in the charts?

A. Not all of them.

By Mr. **Mathewson**:

Q. Is there not a difference of elevation of 237 feet at points supplied by our mains within a distance of less than half a mile?

A. There is.

Q. A question was asked as to what relation a number of feet drawn from service mains supplying one point had to a number of feet drawn from the service mains supplying another point. Is it possible to introduce any such comparison or make any relation between the two?

A. I do not consider it is. No, sir.

Q. Your attention has been drawn to certain points where the pressure is quite variable, such as to 609 East 14th Street. I suppose if the company was to disregard the expense and introduce capital enough, and there was in the street room enough so they could run a separate main to each consumer, they could make the pressure uniform, or substantially so within 1½ inches?

A. I believe, if there was no obstacle in the way of a theoretically perfect distribution system, they could do so.

Q. Is that commercially possible in the City of New York?

A. Not in my judgment; no, sir.

Q. These charts which you presented, I understand, represent actual working conditions?

A. They do.

Q. As you meet them day by day?

A. Yes.

Q. Is it true, if you assume a reduction of one inch in pressure at one point in the system, you mean a reduction of one inch in pressure at every other point in the system necessarily?

A. Not at all.

6277 Q. Isn't it true that the pressure at one point of the system may be going down and at another point going up, with the initial pressure at the holder identical?

A. That is the case, yes, sir.

Q. Now, let us test Mr. Edgerton's theory for a moment. Take Complainant's Exhibit 350. Suppose we try to guess the pressure at the holder by having a gauge indicating that the pressure was going up or down at some point. We will take these points at 4:30 P. M. Take point 5 shown on Exhibit 350. Now, from 4:30 on the pressure appears to be dropping at point 4, doesn't it?

A. It is, yes.

Q. And if you were to be governed at your station by the apparent drop then you would raise the pressure?

A. We would.

Q. However, if you look at the point marked green, 317 West 42d Street, and you had an electric connection with that, that at the same moment would show the pressure rising there, wouldn't it?

A. It would.

Q. If you arranged the pressure by a majority and, say, four were going down and one going up, and you would raise your pressure, you would actually raise the pressure in reference to that particular point where the pressure was rising much more rapidly than it was going down at these other four points?

A. Yes.

Q. And that would be unwise to be governed by the majority pressures?

A. I should think so.

Q. Is it possible, from your experience, to take any one station or the indication of any one station as plotted on these charts and proceed to regulate for that station upon the assumption that every other station will fall in pressure or rise in pressure in the same proportion as you had the pressure for that point?

A. No, it is not.

Q. Does your experience show that directly the contrary will be true?

A. It does.

6278 Q. You spoke of the 18th Street holders being now used to back up the pressure at certain hours of the day. Are they not still used as a necessary part of the distributing system?

A. Oh, yes, they are.

Q. And necessarily?

A. Entirely so. I do not remember my exact answer to that question except that I said——

Q. You said it was used to back up pressure at certain parts of the day?

A. That is what it does. The gas is not sent out from there.

Q. You mean that is not a manufacturing station?

A. Yes. It is transferred to those points from 14th Street, and the pressure regulation for that part of the city effected from that station.

Q. If there is pressure enough for a consumer to use for his different appliances he can regulate it. If there is not pressure enough is there any way by which he can secure the gas?

A. No.

Q. Assuming he has two apparatuses, a stove requiring two or two and one-half inch pressure, and the flat-flame low pressure burner which shows the greatest efficiency at one-half inch pressure, do you know of any way in which he can use both of those without regulating one or the other and exhibiting this common sense to which we have referred?

A. No possible way to do it that I can see without regulating. It is a natural thing to do.

Q. Do you know of any method by which a consumer can get an absolutely uniform pressure upon a single apparatus throughout the twenty-four hours of the day?

A. No, I do not.

Q. Isn't it true that if you take one of these points in Exhibit 345 or the succeeding exhibits, which shows a range between one inch and two and one-half inches, in such cases there are constant drops or rises of half a tenth or half an inch, so he would have to 6279 continue to make changes twelve or thirteen times even in this case if he wanted to keep a supply at his burner of exactly the same amount at all times?

A. If he wanted to maintain the pressure absolutely uniform.

Q. It is not confined to the stations and cases where you have the highest variations, is it?

A. No.

Q. In reference to regulating devices, the form, as valves and valve houses, aren't they, for the purposes of regulation so far as that can be done effectively?

A. Of the pressure of the gas leaving the station, yes, of course.

Q. And I will ask you whether in your judgment and upon your experience it is possible in New York City by any system of valve or by any automatic regulators in the streets to render the pressure at all points and at every time in the City of New York between 1 and 2½ inches and at the same time distribute gas efficiently to each consumer?

A. I consider it utterly impossible.

Q. Do you know of any system where the consumer if he does not exercise some reasonable supervision over his apparatus can get efficient service at his different burners?

A. No.

Q. Or obtain a uniform pressure at the different burners?

A. Not without exercising some judgment as to the manner of using them; certainly not.

Recross-examination by Mr. **Kirby**:

Q. Does Complainant's Exhibit 350, one of those profiles which you produced here, show the rising and falling pressures of the district gauges without direct reference to the pressure maintained at the works?

A. Yes, without showing the works pressure maintain-d at that time, on the profile.

Q. The Consolidated Gas Company has certain holder stations—63rd Street, 65th Street and others?

A. Yes.

Q. And these have been considered by you in making up your charts which have been placed in evidence? 6280

A. Yes.

Q. Was 18th Street considered by you the same as 63rd Street, 65th Street, and the other holder stations?

A. 18th Street was considered by me with regard to the district supplied by the 14th Street station, and the works pressure for 18th Street should have been shown on the profile for the 14th Street district.

Q. In the 18th Street station supplying gas in the district shown by you for the 14th Street station the same as 63rd Street, 65th Street and other holder districts do for districts indicated by them?

A. Yes. This is a holder station and takes gas from the manufacturing station and distributes it after regulating the pressure there on that section of the district.

Q. Then your charts are deficient in that they do not show the station pressure at 18th Street?

A. The one chart on the 14th Street district is lacking the works pressure line for that station, yes.

Q. That works pressure would have an influence over the pressures throughout that district, would it not?

A. Particularly on that side of the district, yes.

Q. Would it have an influence on any other district than the one shown in the 14th Street chart?

A. No.

Q. What position did you occupy with the U. G. I. of Philadelphia?

A. I was employed by the U. G. I. Co. in 1895, in a clerical position, in the purchasing and later in the engineering department.

Recross-examination by Mr. **Burr**:

Q. Pressure falling at one point while it was rising at another point would indicate, would it not, that the mains at the point at which the pressure fell were not large enough to take care of the demand on it by the consumer? 6281

A. No, not necessarily.

Q. Why not?

A. I think that as a matter of fact a somewhat special condition of consumption, some excessive distance from the works or some particularly low el-vation, would have bearing on that.

Q. In addition to the size of the main?
A. Yes.

Redirect-examination by Mr. MATHEWSON:

Q. You have been asked in reference to using a larger main and decreasing the pressure. If a six or eight-inch main was sufficient to supply all the demands of the street or vicinity would you consider it as wise or as expedient to put in a thirty-inch main merely because there would be less pressure in a big main, with the same amount of gas?
A. No, certainly not.

OSCAR H. FOGG resumes the stand and further testifies in rebuttal:

Direct-examination by Mr. MATHEWSON:

Q. Have you prepared, Mr. Fogg, for the year 1905, which we have been considering principally in this connection, a chart showing the variable demand on the street system?
A. I have, yes, sir.
Q. And what does this chart which you now produce indicate?
A. That chart indicates the hourly output or the variable demand on the street main system at two days in the year 1905; the heaviest day of the year in the heaviest part of the year and the heaviest day in the lightest part of the year.
Q. That is the heaviest day in the winter and the heaviest day in the summer?
A. Exactly.
6282 Q. So that the chart that you have now shows the maximum of the summer months and the maximum of the winter months?
A. It does.
Q. And the difference in consumption and direct connection with the maintenance of pressure and the difficulty of maintaining pressure?
A. It is.

The chart is offered in evidence.
Received in evidence and marked Complainants' Exhibit 352.

Q. What does this second chart I now show you indicate?
A. The second chart shows the same maximum day as plotted on the first chart, and the minimum day of the year 1905.
Q. In other words, the extreme difference between the maximum day and the minimum day of the entire year?
A. The extreme condition for the whole year; yes.
Q. In each one of these charts the figures at the left represent thousands of feet, do they?
A. They do.
A. And the figures at the top represent the hours of the day?
A. They do.
Q. And the figures under the date in each case represent the output?
A. They do, yes, sir.

The chart is offered in evidence.
Received in evidence and marked Complainant's Exhibit 353.

By the **Master**:

Q. These high figures are the same in both charts?
A. They are, yes.

By Mr. **Mathewson**:

Q. This is the minimum summer day against the maximum day?
A. Yes.

Q. There have been spread upon the record two letters of 6283 C. F. Lacombe, Chief Engineer of Light and power, complaining that the pressure at the pumping station, 179th Street and Amsterdam Avenue, was poor; the second letter repeating the complaint and saying that the inspection made by the city on December 5th found that the trouble had not been remedied. Now, the pressure of the gas at that particular point is regulated, is it not, by the station at 132nd Street mainly?

A. I believe it is. It is affected to some slight degree possibly also by the pressure backed up from Inwood.

Q. Precisely, by those two?

A. Those two.

Q. Have you the Bristol recording chart which was taken pursuant to your directions, the regular chart of the company, on December 5th, at the 132nd Street station, showing what pressure was there when the city was unable to get sufficient pressure at the pumping station?

A. I have.

Q. Is that it?

A. That is the chart.

Q. Have you also the chart for the Inwood station for the same period?

A. I have.

Q. Is that it?

A. It is.

Mr. **Mathewson**: I offer the chart for the 132nd Street station and for the Inwood station in evidence.

Received in evidence and marked respectively, Complainant's Exhibits 354 and 355.

Q. The pressure appears, does it not, to have been about 6½ inches at 132nd Street when the gas was sent into the distributing mains?

A. It ranges from a pressure of 1.9 inches at the minimum to 6.3 inches.

Q. And does Exhibit 355 show that at Inwood the pressure was from 1.8 to about 3 inches for the same day?

A. Yes, sir.

Q. When Mr. Simpson was on the stand he was asked in reference to a test which was made after the receipt of Mr. Lacombe's 6284 letter of December 12th to see what the pressure in the vicinity of the pumping station was, and he produced a chart.

Was this pressure taken by your direction upon the chart I show you for the purpose of determining what the pressure was at the pumping station? That is taken on the lamp post, isn't it, near it?

A. It is taken at the base of the lamp post. I had it taken at Mr. Simpson's direction.

Q. That shows a minimum pressure at that point of 1.3 inches, such minimum pressure being at 6 o'clock P. M., doesn't it?

A. It does, yes, sir.

The chart is offered in evidence.

Received in evidence and marked Complainant's Exhibit 356.

Q. This test was made on what date; that gauge was taken on what date?

A. That chart was removed actually at 2 o'clock in the afternoon of December 15th. The clock movement was a little bit late on that and the time shows 1.45; the man removing the chart, however, has marked that "15 minutes slow;" he has noted that difference and marked it 15 minutes slow.

Q. The pressure at this particular point was supplied, was it not, by the 132nd Street station, backed up, as you have said, by the Inwood pressure?

A. It was, yes, sir.

Q. Now, will you look at these two charts which I hand you and say whether they are the records of the 132nd Street pressure at that time and covering the same period as Complainant's Exhibit 356, showing the pressure at the lamp post close to the city pumping station?

A. They are; yes.

Q. Now, at the time when the pressure at this lamp post close to the city pumping station was 1.3 inches, that is its minimum, what was the pressure at the 132nd Street station as the gas went into the mains?

6285

A. At 6 P. M. the pressure at the 132nd Street station was just rising from 6.2 inches to 6.35 inches, rising right on the hour line.

Mr. Mathewson: I offer those two charts in evidence relating to 132nd Street.

Received in evidence and marked Complainant's Exhibits 357 and 358.

Q. And do these two Bristol recording charts which I now show you represent the pressure at the Inwood station covering the period of Complainant's Exhibit 356, being the pressure chart at the lamp post near the pumping station?

A. They do.

Q. And what appears to have been the pressure at the Inwood station at 6 P. M., when the pressure at the lamp near the pumping station was 1.3 inches?

A. 3.1.

The charts are offered in evidence.

Received in evidence and marked Complainant's Exhibits 359 and 360.

Q. Now, at the time that the test was made on the lamp outside of the pumping station at the lamp post, and covering the same period as Complainant's Exhibit 356, was a record taken inside the pumping station so as to show the exact record there?

A. There was.

Q. Is that it?

A. Yes.

Q. And this shows, does it not, that at 6 P. M., the time to which we have been referring, the pressure inside the pumping station was .9 of an inch, or substantially that?

A. 8½.

The chart is offered in evidence.

Received in evidence and marked Complainant's Exhibit 361.

6286 Cross-examination by Mr. **Kirby**:

Q. Do I understand that Complainant's Exhibit 352 shows the sales of gas by the Consolidated Gas Company?

Mr. Mathewson: No; sent out.

Q. What does it show?

A. It shows the variable demand on the street mains in the City of New York.

Q. What do you mean by the variable demand on the street main system?

A. I mean the maximum and the minimum day consumption on the mains in New York City.

Q. How is that consumption measured; that is what I am getting at?

A. It is the output, the maximum day divided into hourly points.

Q. You mean the total number of feet of gas sent into the mains from all the stations?

A. No. We mean it is the total number of cubic feet of gas sent out by all the stations into the street mains.

Q. Which would be represented by the sales during that day, less the loss?

A. Yes, exactly.

Q. The last is also true of Complainant's Exhibit 353?

A. That is correct.

Q. Now, as far as the appearance of this curve is concerned, in Exhibits 352 and 353 or these other curves, it would make no difference whether the output was shown by thousands of cubic feet or one cubic foot or any number—the feet would be indicated in the same way and the general character of the curve would be the same, would it not?

A. You mean the shape of the curve would be the same?

Q. Yes.

A. If the consumption were reduced in any given proportion both days?

Q. Yes.

A. Yes, provided the hourly scale were reduced in the same proportion.

Q. And if instead of thousands you had one cubic foot or
6287 5,000 cubic feet it would make no difference what the unit of measurement was, the character of the curve would be just the same?

A. Provided the reduction in the profile were made correspondingly both as to the time and the spacing.

Q. Now, you know that a great amount of electric current is furnished in the Borough of Manhattan, do you not?

A. There must be. I should say yes.

Q. You are also familiar with the fact that that consumption is not uniform throughout the twenty-four hours, are you not?

A. The consumption of gas?

Q. Of electric current?

A. No, I don't suppose it is.

Q. And they have a very heavy load at certain periods of the day compared with other periods, have they not?

A. I should think so, at the lighting hours.

Q. What is known as a very high peak?

A. Yes, I should think so.

Q. Which would correspond to the high peak indicated in Exhibit 352?

A. I don't know whether it would correspond at all. I am not prepared to say that. They must undoubtedly have a heavy peak in lighting hours. That is as far as I am prepared to say anything about it.

Q. And are you not also familiar with the fact that they maintain practically a constant voltage or pressure notwithstanding that peak?

Mr. **Mathewson**: I object. I do not think you can very well compare electricity and gas in that regard.

Question allowed; exception.

A. I am unable to answer the question.

Q. I call your attention to Complainant's Exhibit 354. I do not quite understand where that reading was taken. Will you
6288 inform me again, please?

A. That is the initial pressure of the gas entering the distributing mains from the 132d Street station.

Q. Will you kindly give me the chart which shows the pressure readings outside of the pumping station?

A. Here it is (Complainant's Exhibit 356).

Q. Where was that reading taken?

A. At the base of the street lamp—directly outside the pumping station on Amsterdam Avenue.

Q. What size main is the lamp connected with?

A. I don't know.

Q. What was the consumption of gas from that main?

A. I don't know.

Q. How far was that point from the 132d Street station?

A. Why, I would guess it at probably 2¼ miles.

Q. What was the difference in elevation?

A. Between what, that point and the station?

Q. Yes.

A. I could tell you by referring to some of the profiles here and to the elevation marked on the back of the chart and I will give you the elevation of the 132d Street station: the elevation of the 132d Street station is 35 feet.

Q. And while you are referring to that exhibit giving the elevations, what was the elevation of the Inwood station?

A. The elevation of the Inwood station was 40 feet.

Q. I call your attention to Complainant's Exhibit 361. Am I right in stating that that pressure reading was taken inside of the city pumping station?

A. It was.

By Mr. **Mathewson**:

Q. That was taken on the service inside and the other was virtually on the main outside?

A. Yes, sir.

6289 By Mr. **Kirby**:

Q. Comparing Exhibit 356 with Exhibit 361, I ask you if you can find any points on Exhibit 361 which indicate as high a pressure as any corresponding point of Exhibit 356?

A. The pressures are practically un-form, except in the lighting hours; that is, there is not much difference between them.

Q. They are lower within the station than they are outside?

A. They are naturally lower inside the station; the station is a lower elevation than the street.

Q. How much?

A. I think the charts state.

Q. I fail to see where they so state, unless it be this note on the back of Exhibit 361, approximate elevation of gauge 40 feet below street surface; is that what you refer to?

A. Yes; the pumping station is in a hollow there; it is below the street's surface.

Q. And the elevation of the station is, as set down in Exhibit 356, 157.49 feet above mean sea level?

A. That is the elevation of the street outside the station.

Q. That is the point where this reading was taken?

A. Yes, the street reading, that is right.

Q. How much difference do you calculate this 40-feet would make in pressure?

A. A trifle over .2 on a gas of 600 specific gravity.

Q. So that if we take, say, 9 P. M., when the reading inside the station is 1.5 inches, the reading outside the station would be approximately 2 inches?

Mr. **Mathewson**: You have omitted the loss in going through the service. Even if on the same level, it is about half an inch.

Q. Well, look at the charts and the two exhibits, and tell me what the loss is and to what cause you attribute it?

6290 A. Loss between street pressure and the pressure at the head of the service inside of the pumping station is 4½/10ths. I think that is accounted for both by the drop in the pipe consumption——

Q. How much by the drop in the pipe?

A. And the drop due to elevation. The drop due to elevation I have given at a trifle over .2—say .2. It would leave the difference in the drop to the consumption; friction passing through the pipe.

Q. And which, of course, would indicate that gas was being used in the station?

A Yes, sir.

Q. And if such gas was not being used. the two charts would be identical except for the loss due to elevation, which you have stated to be approximately .2 of an inch?

A. If there was no consumption loss that would be the case. If there was no consumption the question of pressure regulation would not bother us either.

Q. I assume that is quite true. I assume you obtained the total here by adding up the readings at the various meters from the manufacturing stations or the holder stations?

A. No; I merely took the hourly test as kept in the records of the engineering department.

Q. That is the way they are kept, is it not?

A. Yes, I have taken it from their records.

Q. Did you allow for the gas which came from the Standard and New Amsterdam or other companies?

A. That is the total sent out by both companies.

Q. That is the total sent out?

A. I have not stated so here as clearly as it might have been stated. That is the street main system of New York.

Mr. Mathewson: That is merely to illustrate the difference in consumption.

Mr. Kirby: That is what I intended to get at in the beginning.

6291 Q. What do you mean by street main system—New York, Manhattan and The Bronx?

A. On Manhattan Island.

Q. From any and every source whatever?

A. Yes, from there.

Cross-examination by Mr. Burr:

Q. What did you say Exhibit 356 shows, Mr. Fogg?

A. Exhibit 356 shows record of the pressure on the street lamps located outside of the pumping station at 179th Street and Amsterdam Avenue.

Q. And shows it to be what? 1.3 inches?

A. That is the lowest point; yes, sir.

Q. When was that?

A. 6 P. M.

Q. That is the minimum?

A. Correct.

Q. What was the size of the main leading into the city's pumping station at that point?

A. The service?

Q. Yes.

A. That I don't know.

Q. What was the size of the main from which you got the pressure—you don't know, you say?

A. No. This pressure?

Q. Yes.

A. The service you mean leading into the building?

Q. The service?

A. No, I don't know that.

Q. Do you know the size of the main in the street?

A. No. I have already stated that.

Q. Now, Exhibit 353, does that exhibit cover gas purchased by the Consolidated as well as gas made by the Consolidated?

A. That includes all gas sent out by the Consolidated, therefore I assume it must.

Q. It includes purchased gas?

A. It includes all gas sent out. It must include the purchased gas.

Q. Have you carefully kept these records of the demand on the mains of the Consolidated Gas Company?

A. In that form?

Q. Yes.

A. No. We have never plotted them that way. Yes, I
6292 do remember that. They have been plotted that way several
times.

Q. Don't you keep a record showing the maximum and the minimum?

A. Oh, yes, a book record, a record of the hourly send-out. That is where I have gotten these figures.

Q. And these figures 81,587,000 represent the maximum output on January 4, 1905?

A. For the total 24 hours, yes, sir.

Q. That is the maximum for the whole year?

A. That is the highest part of the year.

Q. Have you a record showing the maximum output in the highest record for the year 1906?

A. There is such a record, yes; there must be.

Q. And for 1904?

A. Yes. I suppose so. There is a book of "Send-Out" records. Those ones I have here are the only ones I have had occasion to refer to.

Q. Do you keep those?

A. No.

Q. Who keeps them?

A. Those are kept by the engineering department—the Chief Engineer's clerical force.

At 4:25 P. M., adjourned to Monday, January 28, 1907, at 11 o'clock.

Last Exhibits:

Complainant's, 361.
State's, 000.
City's, 236.

6293 NEW YORK, *January 28th*, 1907.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Kirby, Mr. Page.

MR. MATHEWSON: Mr. Master, consecutive with Mr. Fogg's testimony I would like to have a few of these charts from which the profile was made up marked so that they may be compared if desired. The first one is the reading at 4 Irving Place; the chart for two days is presented so as to cover the period shown in the profile.

Chart received in evidence and marked Complainant's Exhibits 363*a* and 363*b*.

MR. MATHEWSON: Also the pressure gauge for 609 East 14th Street, showing the extreme variation of that district..

Chart received in evidence and marked Complainant's Exhibit 364.

MR. MATHEWSON: Also the gauge at 317 West 42nd Street covering the period plotted on the chart; this gauge covers two days.

Chart received in evidence and marked Complainant's Exhibits 365*a* and 365*b*.

MR. MATHEWSON: Likewise for 145 West 69th Street, covering two days, in order to cover the period profiled on the chart.

Chart received in evidence and marked Complainant's Exhibits 366*a* and 366*b*.

6294 MR. MATHEWSON: Mr. Burr telephoned that he cannot be here for half an hour, and suggests that we proceed, and if it is agreeable I will do so.

ROBERT A. CARTER recalled as a witness in behalf of the complainant, in rebuttal, testified as follows:

Direct examination by MR. MATHEWSON:

Q. Mr. Carter, in view of remarks in the testimony of Mr. Marks I wish to ask you just a moment in respect of his examination of the plant and books. You were informed at the outset, were you not, that Mr. Marks would be in charge of the examination of the books of the company and not of the examination of the plant?

A. Yes, sir, I was so informed.

Q. And in the course of this examination of the books, how many men were employed in your office for several weeks?

A. From 25 to 35 men; as high as 35 men at a time.

Q. With Mr. Hall also?

A. Yes, sir.

Q. And was any information denied them in respect to the period which they were to examine?

A. None whatever.

Q. After a considerable time were you asked by Mr. Marks whether he might examine the plants, and did he say why?

A. He asked to be permitted to examine the plants in connection with certain vouchers which the Board of Advisory Engineers wished some further information regarding.

Q. And what did you tell him?

A. I told him that if he would indicate the specific vouchers that were questioned we would be glad to comply with that request.

Q. And as soon as those vouchers were indicated, several 6295 weeks later, did you then permit him to go into the plant and examine?

A. Yes, sir.

Q. And that is the whole story, is it not, in brief?

A. All there is to it.

Q. Now, Mr. Marks introduces a certain theory as to the increase in the output of gas on Manhattan Island. What have you to say on that subject?

A. My opinion is that when Mr. Marks gets away from Manhattan Island in showing increase in gas consumption, whether due to reduction in price or any other reason, he deals with situations in no respect comparable as to territory. The Consolidated Gas Company having its natural and permanent limitations, it has no suburbs through the development of which additional business is likely to be had. Such growth in the gas business in Greater New York will benefit such companies as Brooklyn, Bronx, Long Island and Jersey City companies, and not the companies supplying the Island of Manhattan. In Mr. Bemis' testimony he stated in respect to the increase in London, that the increase on output was in the suburbs of London and not in the city proper. Respecting the alleged probabilities of increase on the volume of gas sold in the Borough of Manhattan, the reduction in the price of electric current is resulting in its introduction into almost every new apartment house which is erected.

New devices for the use of electric current for domestic as well as commercial purposes are constantly appearing on the market, including cooking and heating apparatus, the development of which cannot fail to cut into the business of the gas companies.

In addition to the reduction of the price of electric current, 6296 the introduction of incandescent lamps which give a greatly increased illumination in proportion to the amount of current used, also operates to cheapen this service and encourage its more general use in place of gas.

Mr. Marks made some calculations showing increase of gas sales in the future due to reduction in the price of gas and increase in population. In my judgment the rate war in 1899 and 1900 and the coal strike in 1902 and 1903, both operated to establish an average consumption per capita, which will probably never be exceeded in New York City. It is greater in New York than elsewhere as shown by the testimony. In the former case the sixty-five cent rate led to a more liberal use of gas than ever before, and this has survived the restoration of the price to a paying basis. The coal strike led to a more general use of gas for domestic purposes, cooking, heating, etc., which had its permanent effect. In my opinion a reduction in the price of gas at this time to sixty-five cents and another coal strike could not possibly lead to a repetition of those results. In other words, any advantage resulting from a substantial decrease in price of gas, we already have to the fullest extent, and any increase we might realize in population is likely to be entirely, if not more than absorbed by the development of the electric business.

There is another feature of the question dealing with the substitution of electric current for gas that is very important to the gas companies, and that is the fact that it is in the larger installations that gas is supplanted with electricity. Though the meter may not be taken out, the consumption of gas drops to practically nothing, and they keep the gas meter there as a kind of a stand-by 6297 service in the event of the electric current giving out; and the result is that while the company has all the expense of attending to that installation, indexing and billing and collecting, and all the other distributing expenses that it had when a large volume of gas was consumed, there are small sales over which to spread such expense. In other words, the company is losing large units of business, and taking on a number of small units of business, which cannot fail to increase the cost per thousand of distribution as well as decrease the average sales per meter in use.

Q. Now, Mr. Marks makes a certain estimate of operating cost and in that connection a certain estimate of depreciation.

A. The weakness in Mr. Marks' estimated cost of operating is that it contradicts his value of the plant and property, or his stat-ment of the value of the plant and property contradicts his estimated cost. The two by no means can be reconciled. The average cost of repairs and renewals since 1884 has been shown to be 10.89 cents per thousand cubic feet sold. According to Mr. Marks' valuation of the plant this has not been sufficient to take care of repairs, wear and tear, supersession, obsolescence, inadequacy and antiquation. He finds that notwithstanding the amounts expended on the upkeep of the property it has nevertheless depreciated in value some $6,738,736.72, shown by comparison between the amount invested in manufacturing plant October 31, 1905, as shown by the company's books, $16,087,428.72, and the actual present value of operating buildings and gas apparatus, shown in Marks' table, page 5108 of this testimony, $9,348,692. The depreciation therefore claimed by Marks over and above that which has been taken care of by expendi- 6298 tures for repairs and renewals is $6,738,736.72, which distributed over the sales since 1884, 164,076,199,000 cubic feet, amounts to 4.11 cents per thousand cubic feet sold. In his estimate of the proper allowance for operating expenses, he employed the actual expenditures of the company for repairs for the calendar year 1905, and the cost of renewals for the nominal year ending October 31, 1905, which happened to be lower than for the calendar year, and reached a total of 53.51 cents per thousand cubic feet sold, and said in his judgment that was an adequate allowance. While it is inadequate from any standpoint it is particularly and strikingly so from the standpoint of his valuation of the plant. If he asks that that be accepted he must augment his cost to operate as follows:

Average expenditures for repairs and renewals from 1884 to 1905	10.89c.
Additional loss in value, according to Mr. Marks' estimate.	4.11c.
Making a total of	15.00c.
He allowed for repairs and renewals	7.03c.
Leaving a balance of	7.97c.
To be added to his estimated cost of	53.51c.
Making a total of	61.48c.

But to this amount should be added certain amounts which Mr. Marks rejected and which obviously enter into the complainant's cost of manufacturing and distributing gas.

	Tax on dividend on capital invested in gas business	.47
	Interest on deferred taxes	.71
6299	Interest on consumers' deposits	.39
	Making a total of	1.57

There should also be added the items which he deducted from the expenses but which are also included in the income.

Income from stove rent		.92
Real estate rent		.28
A total of		1.20
Also an item of street lamp expenditures for maintenance which he excluded	2.18	4.95
Making a total to be added to his		61.48
Of		4.95
Making a total of		66.43

This amount includes no allowance for reserve or contingent fund, or for additional enrichment for a full 22 candle power year, the year in question having co[illegible]ined but six months of 22 candle power term, and said six months not including the cold winter months, when the highest enrichment is required.

Q. Now, as a matter of fact, Mr. Carter, the expenses are expenses, are they not, whether they are subsequently met in part by receipts or not; in other words this is an operating expense account you are dealing with?

A. Yes.

Q. The fact that the company has stove rents does not decrease at the time its expenditures for stove repairs, does it?

A. Not in any sense, no sir.

Q. And when you come to deduct receipts in reaching an expense account you are not confusing the two accounts?

A. You are getting something that is not expenses at all.
6300 You are getting another figure entirely. It does not represent expenses. There is one other consideration in that con-

nection which Mr. Marks finds this depreciation to have occurred in the value of the company's property of some $6,738,000. The amount which the company has expended since 1884 in repairs and renewals of its plant over the amount which he allows in the expense would amount to between six and seven million dollars. In other words, if he is right in his estimate of costs, then that amount which the company has expended must be considered as addition to the plant to arrive at the amount which he depreciates the plant in his estimate of its present value.

Q. Mr. Marks made an estimate and computation and gave testimony as to the cost of land and plants of the company. Do you find that to be accurate or inaccurate?

A. Quite inaccurate, and he refers to it in his later table by which he reaches the value of the plant and property by an entirely different process, referring to it evidently as confirming his present valuation.

Q. Now will you recall the figures which he used as a basis and proceed to point out the errors he made?

A. On page 2366 of the testimony, he gives the "increase in the real estate, plant, property and construction since 1884," (referring to Exhibit 89, page 371) as $9,693,565.90. The increase shown here in one item is given in detail in Exhibit 79, page 347a. From the total increase he deducts what he states to be the increase in the value of real estate—$597,918.28 and gets a balance of $9,095,647.62. The increase in real estate which he deducts is the increase between November 11, 1884, and December 31, 1905, instead of October 31st, 1905. The difference $128.71, is negligible, however.

6301 From the above balance he deducts the increase in the value of mains, services, meters, etc., as follows:

Value of mains, services, meters, etc., October 31st, 1905	$12,866,766.62
Appraised value, June, 1884	7,487,000 00
Less office furniture which he omits	70,000
The balance being an amount which deducted from the value Oct. 31, 1905	7,417,000.00

It shows an increase in this property to have been $5,449,766.62. Deducting this from the increase shown above, $9,095,647.62, he arrived at his increase in plants as $3,645,881. The actual increase in plants from November 11, 1884, to October 31, 1905, (exhibit 79), $3,904,937.31. The excess actual increase in plants over his figures being $259,056.31, made up as follows:

Value of this property November 11, 1884	$5,449,766.62	
Appraised in June, 1904 at	5,190,839.02	
Additions, June to November, 1904	258,927.60	
Marks' error in real estate increase	128.71	
		$259,056.31

which is the excess of the actual increase in plant over the figures which Marks showed.

Q. In other words he excludes the increase from June to November, 1904, in real estate?

A. That is the case, yes, sir.

On page 2365 he makes a statement purporting to give the value of plant as shown by Yalden's summaries from the books of the old companies. To the total value which he thus finds, $10,737,418.70 he adds an increase in plant as above, $3,645,881, getting a total of $14,385,299.70 (note that it should be $14,383,299.70).

6302 From this total deducts Mayer's estimate of the value of plant at 18th street taken by the city, $1,508,035; and the value of the entire 111th street plant as shown by the books of the Harlem Gas Light Company, alleging that it has been abandoned, $569,495.57. The total of these two items is $2,077,530.57, he deducts, leaving a remainder of $12,307,769.13, which he announces to be the "value of the actually operating and going manufacturing plants and holders of the Consolidated Gas Company."

Referring to the foregoing deductions, it is interesting to note with reference to the 18th street plant, that this plant is included in his summary of value in 1884 at $1,281,694.84 (See Yalden's summary, Senate document 47, page 674).

Q. And he deducts a value of $1,508,035 or more than the entire plant appears in the total from which he made the deduction, doesn't he?

A. Precisely, yes, sir. On page 84 of the printed testimony, Chief Bradley testified that there had been expended at this station for construction $424,173.09. The total valuation of Eighteenth Street plant in Marks' total of $14,385,299.70 is therefore $1,705,867.93. From this he deducts Mayer's estimate of the value of plant taken by the City, $1,508,035, leaving a balance of $197,832.93 as the value of the present plant at 18th Street included in his final amount of $12,307,769.13. Mayer values the present plant at $588,873 or three times the value arrived at by this process.

Q. In other words, he takes Mr. Mayer's value for the part excluded but wholly ignores Mr. Mayer's value as to the part that remains?

A. Yes, sir. Mr. Marks includes the 111th Street plant in his 1884 valuation at $569,495.57. The additions since 1884

6303 (to which Chief Bradley apparently did not testify) amount to $236,399.72, making the total amount at which this plant is included in Marks' total ($14,385,299.70) $805,895.29, from this he deducts as the value of plant abandoned, $569,495.57, leaving only the cost of the additions, $236,399.72, as the value of the present plant. Mayer values it at $1,039,910.

Q. Generally speaking, is it true that taking the original value of 1884 as to land and plant Mr. Marks deducts present valuation of land and plant and not the valuations at which those items entered into his 1884 total?

A. That was his method of computation.

Q. Very good. Proceed. Now, as to this 111th Street plant which he deducts on the theory that it has been abandoned, has it in fact been abandoned?

A. No, it has never been abandoned. Besides being operated as a distributing station it is held in a reserve capacity, the manufacturing apparatus being in excellent condition, some of it never having been used. The City acquired the plant on but one block out of four, paying for it and for damages to the rest of the plant by reason of its removal the sum of $246,100, all of which was credited to plant account and operated to reduce the book value of additions to other parts of the plant to the net amount stated above, $236,399.72, which forms a part of the total net increase of $3,904,937.31, shown in Exhibit 79. It is obvious therefore, that as he adds only the net increase in plant to his 1884 valuation, the entire amount deducted by Marks, $569,495.57 must be added to his net value of existing plant in order to arrive at its present value even by his process.

The price allowed by the City for the plant condemned was not less than the value at which it was taken over at consolidation or acquired subsequently to consolidation. 6304

Marks on page 2365 gives a summary of the value of real estate in 1884 as he finds it in the Yalden's summaries of the accounts of the old companies, the total being $5,054,014.88.

Although he accepts the increase in the value since 1884 of plant, mains, services, meters, etc., as shown by complainant's exhibits, he entirely disregards the increase in the value of real estate, $597,918.28 to December 31, 1905, and deducts it (Page 2366) from the total increase shown in Exhibit 89, before proceeding with his calculations.

From his Yalden valuation he proceeds to deduct certain items aggregating $1,985,874.37, leaving as the present value of real estate $3,068,140.51. The items deducted are as follows:

Little Italy Park, 111th street and 112th street, Harlem. $365,000.00

But his total of $5,054,014.88 includes the entire real estate of the Harlem Company (Page 2365), of which that taken by the city forms only a small part at $158,899.

Q. That is less than half the amount he deducts?

A. Leaving $206,100.19 less than nothing at all as the value of the balance of the Harlem real estate valued by Mr. Wheelock at $1,227,500.

This deduction is made notwithstanding the fact that Marks had access to all the data necessary to completely inform himself on the subject. He must have procured from the city records the amount $365,000 awarded to the company for the real estate and plant condemned by the city. He could easily have ascertained that the award was divided between real estate, $118,900; plant, $246,100; total, $365,000.

6305 He could, without any trouble, have identified the plot in question in the real estate schedule of the Harlem Company (Page 909) Senate Document 47, and ascertained that the land sold to the city for $118,900 was appraised in 1884 at $86,000.

By taking Yalden's value of the Harlem real estate, $158,899.81, and the appraised value in 1884, $754,000, he would have found that Yalden's value amounted to but 21% of the appraised value. Applying this factor to the appraised value, $86,000, of the land taken by the city, he would have found that the value at which this land was included in his total value of real estate was but $18,060, and he must have known that to deduct $365,000 for a parcel of real estate from a total in which that parcel was included at not more than $18,060 was sophistication of the rankest kind.

Mr. Kirby: Oh, Mr. Master——

Mr. Mathewson: Sophistication is a word we did not coin. That is a word that came from Mr. Marks. He testified he got this figure from the City Record itself.

Mr. Kirby: I must object.

Mr. Mathewson: Mr. Marks used this very term, and now the shoe pinches.

Mr. Page: It is aggravating to have a witness go ahead and draw deductions as to what another man should have done and might have done, and have him characterize what he has done as sophistication. The testimony of the witness does not pinch very much, I will say for Mr. Mathewson's benefit.

The Master: Well, gentlemen, as I have had occasion to say before, I do not like this idea of stump speeches made by witnesses. I had occasion to criticise it several times on the part of the 6306 witnesses called by the defense, and it does not any more commend itself to me now, but some of these other experts managed to get a pretty free view on the record and I do not know exactly how or where I can stop Mr. Carter. If it is possible, Mr. Mathewson, to divide—if you have a manifold of that, and if you can bring out the facts by question and answer, and eliminate this summing up of features of it I think it would be very much better.

Mr. Mathewson: It will lose some force if I were to ask the questions; but as a matter of fact, the Senate document of 1884, Document No. 47, which Mr. Marks was using and which he had before him, and from which he made deductions as this witness shows, showed certain other things which Mr. Marks absolutely ignored.

The Master: You can show the fact.

Mr. Mathewson: And the witness has now consecutively shown that Mr. Marks made certain deductions from the real estate values. He is now proceeding to show that those deductions were utterly uncalled for, and the reason they were uncalled for——

The Master: That is all right, you are entitled to show that.

Mr. Mathewson: Yes; it is not argument, but entirely facts.

Mr. Page: You are entitled to show the facts, no question about that; but that Mr. Marks must have been wrong and that this is a sophistication pure and simple——

Mr. Mathewson: Was not that word used and the word "tricky" used by this same witness who is now being criticised? And 6307 if there is anything that is sophistication that is worse and ranker than this I would like to know where it is.

Mr. Page: Of course, if such was done, putting another witness on the stand to fall into the same error does not cure the original evil.

The Witness: Shall I proceed with respect to the next deduction?

Q. Let us take the next deduction, the parcel of land sold to the New Amsterdam Company.

A. His next deduction is for a parcel of land sold to the New Amsterdam Gas Company for $180,000 which was appraised in 1884 at $130,000. Here again we have the disparity between Yalden's figures and the appraised value of land. The valuation of 14th Street real estate included in the total of $5,054,014.88 amounts to $367,495 (see table Senate Document, 47 page 674, from which Marks got his total). It was appraised at $1,952,500. Yalden's value was about 19 per cent. of the appraised value. It is fair to assume, therefore, that Yalden's value and the value at which it is carried in Marks' statement, of the plot sold to the New Amsterdam Gas Company was not more than $24,700.

Q. That is the same proportion of the total, $180,000, is it?

A. Yes. I think it is obviously carried in Mr. Marks' total at $24,700, the amount of $180,000 is deducted for this plot.

Q. Take the next deduction for bulkheads at 21st Street.

A. The amount deducted was the amount awarded for the bulkheads condemned by the City, $247,858, and is approximately the amount at which all the bulkheads and the water rights at the station were carried in the books.

6308 Q. The next deductions were for bulkheads taken at the 18th Street station?

A. He values them partly by authority of a city expert at $1,193,016.37. This he deducts from a total in which the entire value of the land and bulkheads at the 18th Street station is included at only $473,173.51 (see table Senate Document 47, page 675, from which he obtains his total value of Manhattan companies real estate).

Q. In other words, he deducts there something like $1,200,000 from a total in which the same property was carried at $473,173.51, which would give a minus quantity of how much in that case?

A. Exactly $719,842.86, which of course operated to reduce the already low value of the other property in his statement.

Q. Now, he refers to the sale to the Standard Gas Light Company, without giving the amount. What is the fact as to that?

A. This was a sale in September, 1905, of a parcel of land between 62d and 63d Streets west of Avenue A, which was appraised in 1884 at $118,600, and for which we received $178,078.

Q. That was credited to the real estate account, wasn't it?

A. The entire amount being credited to the real estate account. According to his valuation of the real estate there is a variation there of $2,583,792.65, being the difference between the total value in 1884 of $5,054,014.88, which he himself finds and adding the increase to which he always refers, $597,918.28, making a total value according to his theory of $5,651,933.16, or an excess of the value he arrived at, $3,068,140.15, of $2,583,792.65.

Mr. Kirby: It is quite impossible to take up the cross-examination on a matter of this kind until we have had an opportunity to read the record.

6309 Mr. Mathewson: If it is too fast say so and we will have the witness give the amount slowly.

The Master: Read it slowly.

The Witness: This entire testimony runs consecutively from the page to which is first referred (page 2366 of the printed testimony in this case).

Mr. Marks added his valuation as follows:

Land	$3,068,140.51
Manufacturing Plants and Holders	12,866,766.62
Mains	7,700,151.03
Services	1,212,071.09
Metres, etc., Less Scows and Gas Stoves	3,495,108.58
Total	$28,342,237.83

There should be added for the items which he deducted which are obviously required in the business:

Scows	$19,816.15	
Gas Stoves	287,619.77	
		$307,435.92
There should be added for real estate as previously noted		2,583,792.65
And on the Harlem plant should be added, as established		569,495.57
And for errors in his increase in plant account		259,056.31
Making a Total of		$32,062,018.28

Roughly estimated, about 45% of total plant at 18th street was taken by the city, and that percentage of the amount at which this plant is included in Mr. Marks' total, $473,173.51 or $212,928.07, would have to be deducted, leaving the present value of the 6310 plant and property excluding cash accounts receivable and material and supplies, according to Mr. Marks' theory, $31,849,090.21.

Q. And would this include any working capital or any part of the Astoria investment?

A. No, sir.

Q. Or any franchises or anything of that sort?

A. No, sir.

Q. And it is made up, correcting these errors, upon his theory with the exception of the errors which you have noted?

A. Precisely.

Q. In Mr. Yalden's table he finds value of real estate at 14th street, or rather he puts down figures at which the 14th street real estate is carried and the 21st street real estate. What is the amount at which the 14th street real estate is carried?

A. Fourteenth street, $367,495, consisting of 228 lots, the average value per lot $1,622.34 per lot.

Q. Taking the 21st street station which is on the same side of the city, and his valuation is what?

A. $1,857,000 for 225 lots, a value of $8,253.33 per lot; about five times as great as the 14th street valuation per lot.

Q. Now the 14th and 18th street plants were both plants of the Manhattan Company and both coal gas plants, were they not?

A. Yes, sir.

Q. Does there appear to be any contrast between the Yalden valuation of buildings in the two plants?

A. That is indicated by the table from which the value as given in Mr. Marks' table is obtained, Senate document 47, page 674, the buildings at 14th street are included at $75,197.54 and at 18th street, $372,621.46.

Q. And were the plants of the same capacity?

A. Identical at that time, yes, sir; three and one half millions.

6311 Q. And so far as your observation goes would they require substantially the same equipment and buildings?

A. No appreciable difference, Mr. Mathewson, according to my information.

Q. Is there any way in which you can reconcile the $75,000 for one plant and the $372,000 for the other except the way in which they were arbitrarily carried on the books of the company.

A. They apparently were carried at that value on the books of the company, but the inference is that in writing down the cost of their property the Manhattan Company did not attempt to maintain any parity between the values of these properties.

Mr. Page: Has the witness any knowledge of the facts from which he is drawing inferences?

Mr. Mathewson: He has examined Senate document 47, very carefully, which your witness used, and from which they pointed out their conclusions.

Mr. Page: He is giving what the companies must have done on their books.

The Master: He was asked if there was any way in which he could account for it and I suppose in the absence of any facts, he being an officer of the company, we might take his inference for what it is worth.

Mr. Page: These inferences are of some company he was not an officer of, and where he had no charge of the books.

Q. Mr. Marks referred to the buildings of the various plants of the Consolidated Gas Company as appraised in 1884, and compared
them with Mr. Mayer's appraisal of buildings in 1906, and
6312 showed the difference between the two. Didn't Mr. Rowland
in 1884, so far as the record shows, include the foundations
of apparatus in his estimate of buildings?

A. No, he did not. It was not his rule to do so. In some small buildings apparently he did, but in the large buildings where the apparatus was important, as generators and purifiers, and apparatus of that character, the foundations were included in the apparatus.

Q. They are appraised, are they not, separately, here in the schedule?

A. Yes, sir.

Q. Take the 21st street building for an example which is compared by Mr. Marks in which Mr. Marks compared Mr. Mayer's appraisal to the appraisal of Mr. Rowland; is that building today the same as it was in 1884?

A. No, sir, in no respect. Are you referring to some of the buildings, or the buildings generally at the station?

Q. Well, the buildings generally at that station, the large buildings.

Mr. PAGE: Which is it, the large buildings or the buildings generally?

A. I thought perhaps you were referring to one building given here on 21st street and 1st avenue, which Mr. Rowland valued at $5,000, stating that the building was out of use and the only value he indicated was the value of the foundation. That building is still in use, used as a store for stoves and meters and a portion of the meter repair plant is in it, and it is a perfectly sound substantial building, has had a great deal of money spent upon it, and was unquestionably worth a great deal more in 1884 than Rowland valued it at, unquestionably worth a great deal more than the $5,000 he valued it at that time.

6313 Q. Take the generator building at 21st street, hasn't an additional story been added to that or the roof been raised?

A. The building had to be altered with respect to the roof and elevation to accommodate the new generating apparatus that was installed there in 1891; a new roof was put on the building, and the walls were renewed and raised.

Q. Now, quite aside from the question as to the inclusion of the foundation of apparatus in this building by Mr. Mayer, and the fact Mr. Rowland has done so, is it possible to compare the two buildings today on the assumption that they are the same buildings?

A. In no respect.

Q. As to the other buildings of the company at its various plants, without going into detail, are those buildings now exactly as they were in 1884, or have expenditures been made on them in general?

A. Very large expenditures either in the shape of repair or the shape of renewal and replacements that have resulted in the buildings probably being in better condition now, a great deal, than they were in 1884.

Q. And the amount which has been expended according to exhibit 79 upon the buildings and their contents appears under the heading of plants, doesn't it?

A. Yes, sir.

Q. And shows for the repairs alone something like six million dollars?

A. Yes, sir, over six million dollars.

Q. And expenditures for construction of nearly four million?

A. Yes, sir.

Q. In addition to expenditures for renewals and replacement?

A. That is the case.

Q. Mr. Marks referred to the works from 1894 to 1899 as "tottering to their final collapse," to use his expression. You were

6314 thoroughly familiar with the works during that period?

A. Yes, sir.

Q. Were the works producing gas during that period in increasing quantities?

A. The 14th street plant produced in 1884 three and one-half million; in 1905 it sent out very close to five million; so that the capacity has not only been maintained but it has been substantially increased.

Q. It is true that from 1900 on a certain type of Lowe apparatus was substituted with another type, isn't it?

A. Not at 14th street.

Q. No, but at the water gas stations?

A. Yes, sir, at the water gas stations for other types the Lowe type of apparatus has been substituted.

Q. Is it true during that period the plants or any of them were tottering toward their final or any other collapse.

A. Not true with respect to the plants or any portion of the plants.

Q. Mr. Marks also referred to the great field that the company had in supplying gas in Queens and Brooklyn. Do you know of any franchise that the Consolidated Gas Company has to supply gas in the Borough of Brooklyn?

A. They have none that I ever heard of, no, sir.

Q. Or any in the Borough of Queens?

A. No, sir.

Q. In reference to Prof. Bemis' testimony, he made a comparison between the 14th street station and the coal gas at the Central Union station. Have you read that comparison?

A. Yes, sir.

Q. And have you made up a table showing the errors into which he fell?

A. I have done so, but I would like to explain in reference to the table I have made up that the difference shown by comparing the total cost of coal gas at these two stations is made up of variations in the cost of the items entering into the total which are no indication of efficiency but are due to differences in the conditions be-

6315 yond the control of either company.

In the matter of coke, for example, it has been shown that the conditions under which the Central Union Company deals with this commodity are so favorable as to create a variation of nearly ten cents per thousand cubic feet of gas made.

The fact that the Central Union Company is not obliged for the purpose of equalizing pressure to maintain distributing stations, affects their cost favorably as compared with the situation in New York, the 14th street station having to bear its share of the cost of the maintenance of the various distributing stations of the Consolidated Company.

The fact that the coke delivered from the 14th street station to the Water Gas Stations for use in the generators has to be carted some distance at the 14th street station operates to increase the cost at the 14th street station as compared with the Central Union station, where the Water Gas Plant is adjacent to the Coal Gas Plant.

The fact that in the case of the 14th street station the works have been cut off from the water front by the marginal street, operates to considerably increase the cost of the labor and cartage of coal and coke.

The fact that the Central Union Coal Gas Station is equipped with inclined retorts and recuperative coal gas branches and the latest labor-saving types of coal and coke handling apparatus, operates to reduce the cost to the Central Union Company,—though such advantage, while appearing very favorable in a comparison of cost figures, is offset to a very considerable degree by the additional investment and the consequent increase in the Fixed Charges which does not appear in any statement of cost.

6316 A fair comparison between the cost of manufacturing gas at the 14th street station and at the Central Union's Station, therefore, could only be made by first eliminating from the cost at both stations certain items which are in no respect comparable.

For reasons stated above, the proceeds of the sale of coke should be eliminated, as well as the cost of labor and cartage of both coal and coke.

The item of distribution should be eliminated from the cost at both stations, for the reasons given.

As the 14th street cost includes the oil gas made for the 14th street station at the 21st street station, this should be eliminated before comparing the cost of the coal gas of the Central Union station.

During the year 1905, a small quantity of gas oil was used experimentally in the Central Union Coal Gas Plant, and appears as an item of cost in the statement of the Central Union Company. This should be eliminated to place both stations upon an equal footing.

As the quantity of gas manufactured with the small quantity of oil used in the Coal Gas plant of the Central Union Company is not shown in any of their statements—and as a matter of fact is unknown—it has been estimated upon the basis of the oil gas made pr. gallon of oil used at 21st street for 14th street, about 50 cubic feet per gallon. The cost of labor and repairs in connection with the oil gas made in the Coal Gas Plant of the Central Union Company is not known, and has, therefore, been estimated—with respect to the labor, upon the basis of the cost of labor per thousand cubic feet of oil gas made at 21st street for 14th street; with respect to the repairs, 6317 the cost of repairs has been estimated upon the basis of the cost per thousand of all the repairs to coal gas plant at the Central Union Station.

The table is as follows:

14TH STREET STATION.

Statement showing cost of Coal Gas after eliminating the residual coke, cost of Cartage and Labor handling—cost of Station distribution, and Oil Gas, nominal year ending October 31st, 1905:

	See printed testimony G. C.	Cubic feet.	Amount.	Per M C. F. made.
Total Cost.	2117 / 2120	1,528,773,000	$576,429.56	37.70

6318

CENTRAL UNION GAS COMPANY.

Statement showing cost of Coal Gas after eliminating the residual coke, cost of Cartage and Labor Handling, cost of Station distribution, and Oil Gas, nominal year ending October 31st, 1905:

	See printed Testimony G. C.	Cubic feet.	Amount.	Per M C. F. made.
Total Cost...............	p. 132	670,518,000	$131,249.46	19.58
Add Coke........... ..	212–14–15	....	154,817.63	23.09
			$286,067.09	42.67
Deduct:				
Cartage and Handling..................	132	....	$23,345.12	03.48
Distribution...........	132	....	1,869.70	00.28
			$25,214.82	03.76
			$260,852.27	38.91
(*a*) Deduct Gas Oil...........		10,515,437		
Oil Used......	p. 132.........	....	$8,501.58	
(*b*) Oil Gas, Labor..................		....	5,331.32	
(*c*) Oil Gas, Repairs.........		....	5,131.53	
			$18,964.43	
Total..........................		660,002,563	$241,887.84	36.65

Excess—14th Street cost over Central Union cost=.0156. c. for M.c.f made.

(*a*) The quantity of Oil Gas made is estimated on the basis of the make per gallon at 21st Street for 14th Street, the process being identical. 21st Street make (p. 2145) 168,489,000 c.f. Gallons oil used (p. 2119) 3,371,782 gals. Gas made per gallon 49.97 c.f.

Gas oil used at Central Union (p. 132) 210,435 gallons x 6319 49.97 c.f. per gallon = 10,515,437 c.f.

(*b*) The labor on Oil Gas is calculated on the basis of the cost of Oil Gas labor at 21st Street. 21st Street labor (p. 2119) $9,603.51, makes 168,489,000 c.f. Cost per M. 5.07c. Oil Gas make at Central Union 10,515,437 c.f. @ 5.07c. = $5,331.32.

(*c*) Oil Gas repairs are calculated on the cost of repairs on all gas made at Central Union, 4.88c. (p. 132) 10,515,437 x 4.88c. = $5,131.53.

Less item of gas purchased $460.50 @ 00.06c. per M.

Q. The table that you have prepared and which you now show me shows the cost of the coal gas at the 14th street station, as compared with the cost at the Central Union station, eliminating the items of distribution, oil gas and labor, handling and coke which you have stated were not comparable?

A. That was the case, yes, sir; and I get a total cost at 14th street of 38.21 per thousand cubic feet of coal gas made and at the Central Union a cost of 36.65 cents per thousand cubic feet of coal gas made, a difference of 1.56 cents per thousand cubic feet made.

Q. Now as to that, it was stated that the Central Union installation was more expensive and there would be a larger amount required for the return on investment?

A. That is the case. It was a question whether the additional fixed charges in use at the Central Union for such apparatus as in use at 14th street station would not amount to considerable more than the difference above referred to of 1.56 per thousand cubic feet of coal gas made.

Q. Has the Central Union plant any marginal street between it and the water?

A. No, sir.

6320 Q. So that supplies were delivered directly into its plant?

A. Everything directly into its plant.

Q. And having but a single station there is no station expense, is there?

A. No distributing station distribution to be added to their cost, therefore the item of distribution has been eliminated from both.

Q. The special item in manufacture referred to known as distributing expense between distributing stations before the gas is sent out, in other words, not a distribution expense at all which comes under the general heading of distribution expense?

A. The 14th street distributing expense includes the cost of the distributing station expense, therefore to put both stations on an equal footing the distribution expense has been eliminated from both costs.

Q. Have you prepared another tabulation showing the comparison between the Central Union cost and the Consolidated Gas Company cost, taking the entire output?

A. Yes, sir, I made a comparison for the nominal year ending October 31st, 1905, both statements being in the exhibit and adjusting the Central Union cost to a candle power corresponding to that candle power produced by the Consolidated Company, I get a cost to Consolidated Company of 32.17 cents per thousand and the Central Union 31.34 cents per thousand, a difference of only .83 of a cent per thousand between the cost of the two companies, the Consolidated Company and the Central Union Company. The table is as follows:

6321 COMPARISON BETWEEN THE COST OF MANUFACTURE, CONSOLIDATED COMPANY, AS SHOWN BY EXHIBIT 93 OF PRESENT CASE, AND CENTRAL UNION GAS COMPANY, AS SHOWN BY EXHIBIT 20 OF PRESENT CASE, FOR THE NOMINAL YEAR ENDING OCTOBER 31st, 1905.

Consolidated Gas Company:

Total Station Cost—Exhibit 93		32.68c.
Deduct for Purposes of Comparison:		
Experiments	.03c.	
Depreciation	.48c.	.51c.
Bal. (25.07c.p.@1.28 per candle)		32.17c.

Central Union Gas Company:

Total Station Cost—Exhibit 20 C. U. G. C.		26.57c.
Add for purposes of comparison:		
Expense	.59c.	
Distribution	.42c.	
	1.01c.	
Less gas bought	.06c.	.95c.
Total (22.08 c. p.@1.25c. per candle)		27.52c.

Consolidated Co's Cost:

(c. p. gas, 25.07) as above .... 32.17c.

Central Union Co.'s Cost:

Adjusted to 25.07 c.p.@1.25 .... 31.34c.

Excess:

Consolidated over Central Union Cost .... 0.83c.

6322 Q. Now it appears in evidence that up to the 1st day of July, 1905, that is during the eight months of the year for which you have made the comparison between the Central Union and the Consolidated, there was no inspection for candle power in the Borough of the Bronx where the Central Union operated?

A. That was the case.

Q. Did you make investigation and examination in order to determine how much their candle power fell below that maintained by the Consolidated?

Mr. Burr: Objected to as incompetent, immaterial and irrelevant; we are not investigating the candle power of the Central Union.

Question allowed. Exception.

A. We have a statement of their candle power every month, their station candle power in connection with the statements to us of gas made for us under the agency agreement, and by that means we know that prior to July 1st, 1905, with the average station candle power shown it would be impossible for them to deliver on the district anything like 20 candles.

Q. And as a matter of fact their station candle power showed considerably less than the Consolidated station candle power?

A. Very much less, yes, sir.

Q. When you make this comparison, say a difference of only .83 of one cent to the cost of gas for the nominal year ending October 31st, 1905, did you make an adjustment of candle power for the difference which you found to exist?

A. I did, which the record showed to exist.

6323 Q. And do you not recall that while prior to July 1st, 1905, the gas which was delivered to you by the Central Union Gas Company under agency agreement appeared at a very much less cost than that which you received from the Standard or the New Amsterdam or the Mutual, but after July 1st, 1905, when the new candle power went into effect their gas rose to substantially the other companies?

A. Yes, sir.

Q. Taking therefore the figures of the Central Union and of the Consolidated as you have presented them and eliminating the items in which it is impossible to make comparison, is there any substantial difference in cost?

A. There is none; no, sir.

Q. Quite aside from the question as to the greater return required by the Central Union on its investment?

A. Aside from that.

Q. Now you heard Professor Bemis's testimony, did you not, in which he found a difference of only .98 of a cent in coke as between the receipts of the 14th and the Central Union plant?

A. .98 of a cent, yes, sir. I have looked over that testimony very carefully.

Q. Did he fall into any errors in making that computation and is that conclusion of his correct?

A. There were many errors and the conclusions were incorrect.

Q. Now, will you state as briefly as you can what the errors were?

A. The last calculation Mr. Bemis made in arriving at this result was to divide what he computed to be the variation in dollars between the value of the coke at 14th Street and 42d Street station, and at the Central Union station, $27,464.48, into the total make of the 14th Street and 42d Street station, including the oil gas made at 21st Street for 14th Street, which had nothing whatever to do 6324 with it, 2,809,586,000 cubic feet and getting the result of 1.01 cents per thousand cubic feet of gas made. In this calculation he erred, either by reversing his factors in dividing, or by dividing by the gas sold instead of made. He should, of course, have divided his $27,464.48 by the quantity made which would have given him .98 of a cent per thousand cubic feet, instead of 1.01 cents per thousand cubic feet made. The whole method, however, was erroneous from any standpoint. Mr. Bemis took the coke used in the water gas plant of the Central Union Company, 23,155,050 pounds, or about 15 per cent. of the entire output of coke, and reducing it to short tons, got 11,577.5 tons. This he did without ascertaining whether the price per ton at which the coke was used at the Consolidated water gas stations was based on long tons or on short tons. By using short tons in the Central Union calculation, the result would be a larger number of tons, and a smaller average price per ton than if long tons were used, and thereby the gap between the price per ton at the Central Union and the Consolidated stations would be reduced, no matter how the Consolidated may be calculated. He gets an average price of $3.23 per short ton. After noting, according to his own statement, that the rate per ton of coke used at the Consolidated water gas station, was as follows:

At 21st Street	$3.24
At 44th Street	3.35
At 99th Street	1.45

When the average price received at 14th Street for all the coke produced was $3.08 and at 42d Street $2.90 a long ton, there was no evidence on which he could assume that the price at which
6325 he figured the 15 per cent. of the Central Union coke used in
their water gas plant was identical with the price which they received on the other 85 per cent. of their coke. Nevertheless, this was assumed and the following results obtained. The average price per ton at 14th Street being $3.08 against $3.23 at the Central Union the excess of the Central Union over 14th Street was 15 cents per ton. The price at 42d Street being $2.90 compared with $3.23 at the Central Union gave a variation of 33 cents a ton. Mr. Bemis proceeds to multiply the difference between 14th Street and Central Union, 15 cents, by all the coke produced at 14th Street, and to multiply the difference between the Central Union and the 42d Street station, 33 cents, by all the coke produced at 42d Street, which gives him the figures shown at page 2896 of his testimony. Thus,

14th Street	$8,676.61
42d Street	18,787.87
A total of	$27,464.48

Notwithstanding the fact that the make accounted for at both stations, 14th Street and 42d Street, includes at 14th Street a great deal of oil gas made at 21st Street, and at 42d Street a great deal of oil gas produced at that station, which puts them absolutely out of comparison with the Central Union station, he adds them together and gets 2,809,586,000 cubic feet. And after having his attention drawn to his errors, divides the amount by the quantity and gets .98 of a cent per thousand cubic feet. This is referred to repeatedly as "a difference of a cent in the coke item," of the cost at the three stations, page 2987. Again: "There is no certainty that there is any difference at all," and again "the coke item does not take up
6326 more than one cent of that eleven cents," page 2988, referring
to the difference between the 14th and 42d Street stations and

the Central Union. Later, in reply to an interrogation by Mr. Mathewson, at page 2989, "does that take out the one cent difference for coke?" He answered, "No, because it was not clear that it should be taken out." Later, according to Mr. Bemis' testimony he undertook to establish his fairness by showing that the price at which coke was used in the Central Union water gas manufacture was practically the same as the price received for coke sold, less cartage. But it was apparent that there was no cartage on coke used in water gas manufactured at the Central Union plant, and it was apparent that there was cartage on coke used in water gas manufactured at the Consolidated station which was paid by the coal gas stations. This should have been deducted before making any comparison.

Q. In other words, one represented coke in which there was cartage, and the other represented coke in which there was no cartage?

A. Exactly. In the Central Union case they were supplying coke to a water gas plant which was next door to their coal gas plant, and in the case of the Consolidated they were delivering their coke to water gas stations more or less remote from the coal gas plant. It gave an entirely misleading result, after getting a difference between the coke receipts, in dollars and cents, to divide it by the sum of oil gas made at 21st Street for 14th Street and the oil gas made at 42d Street, and the coal gas made at both stations, when it appeared that there was relatively little oil gas made at the Central Union plant.

Q. In other words, the oil gas was included all the way around, was it?

6327 A. The oil gas was included all the way around, yes, sir. And the result was used to produce the difference in the item of coke receipts.

Q. Instead of being one cent difference, what is the difference, and how is it obtained in the price of coke?

A. Well, on cross-examination Mr. Bemis made a calculation which showed that the difference in the coke item was 9.97 cents per thousand cubic feet of coal gas made.

Q. That was on cross-examination when I called his attention to certain figures, was it?

A. Yes, sir, and then Mr. Bemis injected the element of cartage and labor into the proposition, and I have made a table which indicates that after deducting the cartage and labor the difference is still 8.69 cents per thousand cubic feet of coal gas made between the Consolidated coal gas plant and the Central Union coal gas plant.

Q. Did you find that Mr. Bemis took into consideration the screenings in his computation, or the fact that there were screenings?

A. No. There were some figures made tending to show that there was little difference between the price at which the Consolidated Company's coke was used in the water gas manufacture and the average price of all coke produced, and again between the water gas figures and the selling price, as shown in Exhibit J-414-A, and here he disregards the screenings and deals with coke only, comparing $2.25 per load for water gas stations with $2.25 average selling price, disregarding the fact that out of 29,160.04 loads used at the water gas plants, but five per cent. were screenings, while of the loads sold

21 per cent. were screenings, which sold for 96 cents per load, and the comparison, instead of being between $2.25 and $2.25 as he states, is between $2.19 and $.96.

6328 Q. Have you your computation showing the actual difference, even deducting labor and cartage of 8.69 as between the Central Union and the 14th Street plant?

A. Yes. The computation showing the variation after deducting cartage and labor of 8.69 cents per thousand cubic feet is as follows:

COKE OPERATIONS, YEAR ENDING OCTOBER 31, 1905.

Central Union Gas Co.

	Mr. Bemis.	Central Union Statement.	
Sales	$114,663.76	$114,810.02	(p. 215)
W. G.	37,281.56	34,177.41	(p. 212)
District Boilers		3,204.15	(p. 212)
Coal Gas		2,626.05	(p. 214)
Total	$151,945.32	$154,817.63	(p. 214)
States it to be	$152,045.32		

(Note that to this point not one of Mr. Bemis's figures is correct.)

Labor and cartage	20,935.91	20,935.91
	$131,109.41	$133,881.72
Per M. cu. ft. made		20.29c.

CONSOLIDATED GAS COMPANY, AFTER DEDUCTING LABOR AND CARTAGE.

14th Street	$143,706.08	
42nd Street	150,765.49	$294,471.57
Per M. cu. ft. made		11.60c.

Excess Central Union over Consolidated, 8.69c. per M. cu. ft. made.

6329 Q. And without deducting cartage and labor it would be 9.97 cents per thousand, would it not?

A. Yes.

Q. Now, Professor Bemis stated that it makes a difference of only 3 cents, or actually 3.75 cents per hundred pounds, and that it is not unreasonable in view of the fact that the coke had to be carted from the coal gas to the water gas stations. The difference does not look as much on one hundred pounds, but what does it amount to when applied to the 250—what is the amount?

A. 257,000,000 pounds, which the Consolidated Company sold, the difference between the value of the coke at the 14th Street station, of 3.75 cents per hundred pounds amounts to over $95,000, or about three and three-quarters cents per thousand cubic feet of coal gas made by the Consolidated Gas Company.

Q. Now, the entire cost of cartage from the coal gas to the water gas stations aggregated how much?

A. The entire cost of cartage aggregated but $12,360.66.

Q. But the variation in that regard is one of principle rather than of great amount?

A. Yes, sir, it was purely one of principle, I think.

Q. Now, Professor Bemis in his testimony draws an analogy between deducting the residuals such as receipts from coke, ammonia and tar, and the deduction of miscellaneous income. Is there such an analogy in your judgment?

A. None such as Mr. Bemis claims. The net cost of gas manufacture logically takes out the proceeds of the sales of residuals. But neither from an operating nor from a commercial standpoint can the expenses of distribution which are actual and permanent entities in the business, be reduced by deducting from them the income 6330 from the rental of stoves which may be sold outright at any time, and which every customer has the option of buying at a nominal price, the policy of this company being ultimately to have consumers own their own stoves, or the income from the rental of such real estate as at the moment the company may chance to own and have on rental, as for example, real estate which has been purchased for extension of plant, but temporarily rented; or acquired to avoid damage suits, as the 21st street explosion case, and rented pending the company's finding a market for it. In manufacturing gas we have residuals and they are part of the process.

Q. In other words so far as your residuals of coke, tar and ammonia are concerned, are they not a necessary part of the manufacture of gas, you are bound to get them if you manufacture gas?

A. You are bound to get residuals if you manufacture gas, in some form or another.

Q. They are part of the process?

A. Yes, sir.

Q. Does the same thing apply to the receipts from gas stove rentals or other rentals of that kind?

A. A great many companies have nothing of the sort, neither stove rent nor real estate rent is an item; it is simply incidental to the conditions at the time, and therefore, in my judgment such deductions instead of being "much simpler," as suggested on page 3006, would give misleading results. They would not change the facts and the distributing expenses would go on right after the income of the stoves and real estate had passed into history. There would appear to be an increase in distributing expenses which would not exist at all in fact.

Q. Professor Bemis at page 3063 to 3072 of his testimony referred to the item of 10.89 for repairs and renewals for the twenty 6331 years, and gives a reason for his exclusion of three cents per thousand feet for contingent expense reserve fund, which he allowed before the Gas Commission and he bases this change on the assumption that the company's plant has appreciated, as he puts it, about $13,000,000. Now, that appreciation to which he refers relates or is due to what, practically?

A. The appreciation that he finds is not the result of expenditures for repairs and renewals, but to the increase in the value of the land, the increase in the value of the materials of which our property is constructed, the increase in the cost of labor that would be employed in their reproduction, and reconstruction, and the greatly increased cost of laying mains and services due to high grade and expensive pavements.

Q. It is due practically, if not almost wholly to the increase in the value of land and the increase in the value of mains and services due to change of pavement?

A. That enters very largely into the result.

Q. And have any receipts from consumers gone in to produce that increase at all?

A. None, no sir.

Q. In other words, the plant has not been built up out of the returns from the consumers of gas?

A. No, sir. In connection with that conclusion of Mr. Bemis the table made upon pages 3063 and 3064 and 3065 of his testimony, indicates an error there, of a million dollars, and another error in the computation of the rate per thousand cubic feet of gas sold since 1884.

Q. In other words, he makes a certain computation of the number of cents per thousand it would make if we divided the appreciation of the value of our land, mains and services by the output of gas, does he not?

A. Well, he uses the output of gas for twenty years as a
6332 factor, but the balance which he reaches, $4,676,497.58,
which should be $3,676,497.58, is the difference between the increase which he finds in the value of the property as appraised in 1905 over the plant in 1884, he finds an increase of $23,409,000, in round figures, and deducting from that the additions shown on Exhibit 79, $9,693,565, he gets a balance of $13,716,000, and deducting that——

Q. That $13,716,000 is what he calls the appreciation of property which is due substantially to the increase in the value of real estate and the increase in value of mains and services?

A. Over and above the expenditures of the company.

Q. And he deducts that from the total expenditures for renewals and repairs?

A. For renewals and repairs $17,392,000 and gets according to this testimony $4,676,000, actually $3,676,000.

Q. In other words his subtraction results in an error of about a million dollars, exactly a million dollars?

A. Yes, sir, and a rate per thousand of 3.46 cents, which I am unable to obtain by using any figures of sales——

Q. In other words, taking either the remainder which he actually got, or the remainder which he should have got, which differed a million dollars from that, and dividing by any amount of gas, is it possible to get the 3.46 cents which he assumed?

A. No, it is not.

Q. Furthermore in making that assumption and in arriving at that result even on Mr. Bemis' theory, is it not necessary for him to get his depreciation, to accept the valuations of property and plant which the company has put on them?

A. Absolutely.

Q And he does so in making the computation, does he not?

A. Yes, sir.

6333 Q. You cannot on any theory get any such result without assuming those valuations, can you?

A. No, the theory on which Mr. Bemis excludes any of the 10.89 cents involves the acceptance of the appraisals of the company's property by its own experts.

Mr. Page: I merely wish to suggest that the relative duties of counsel and witness seem to have been changed; the counsel is testifying and the witness is summing up the case.

Mr. Burr: That has been continuous for months, Senator.

Q. Now, as a matter of fact, Mr. Carter, is there anything in the situation that you know of or anything in the facts which appear by the testimony which would make an inclusion of three cents for a contingent fund proper at the time of the testimony before the Gas Commission and exclude the three cents at this time?

A. Nothing whatever.

Q. No change in circumstances whatever at all?

A. No, sir.

Q. Now, Mr. Bemis also testified as to land values without going into details. How did you find his method compared with the method of Mr. Marks, which you have already pointed out to be erroneous?

A. On page 3046 Mr. Bemis starts with Yalden's valuation of land and deducts, as Mr. Marks did, the alleged valuation of certain land sold or taken by the city aggregating $1,585,874.37. Whatever the company received for land which it sold was credited to its plant and property account, and operated to reduce the net increase from
1884 to October 31st, 1905, $9,693,565.90, which Mr. Bemis
6334 adds to Yalden's valuation in 1884, and such deduction hav-
ing already been made, Mr. Bemis' deduction operates to take
out this value twice over.

Q. It had already been deducted, and Mr. Bemis deducted it again, did he?

A. Such is the case, yes, sir. Furthermore——

Q. And was Professor Bemis's deduction of real estate at 18th Street, for instance, from the total deduction at the value at which that real estate was carried in the total or the value at the present time, which was several times the original value?

A. The value at the present time, several times the value at which it is included in his total.

Q. Did you find any inaccuracy of Professor Bemis in his assumption of the proportions of oil used?

A. Why there was, Professor Bemis made a misstatement with respect to the proportions of low grade and high grade oil used by the Consolidated Gas Company in the calendar year 1905, stating that it was——

Q. He stated what proportion of the high grade oil was used?

A. 16% of the high grade oil.

Q. As a matter of fact what proportion actually was used?

A. 25%, slightly over.

Q. And he made his computations and assumptions on the theory of the 16%, did he?

A. That is the case, yes, sir.

Q. Now he also refers to the fact that the services are less in number than in 1885. What is the explanation of that? There seems to be a small decrease in the number of services?

A. The change in the character of the structures or buildings which the company supplies; not infrequently a large structure takes the place of several small ones, resulting in the abandonment of several small services and substituting of one large one.

6335 Q. Does the substitution of large buildings covering many lots for smaller buildings affect the number of services?

A. Yes, sir, it decidedly does.

Q. It reduces them?

A. Yes, sir.

Q. How about the size of the services?

A. The size of course would increase very considerably.

Q. So that in spite of the reduction in the number, the increase in the size has resulted, has it not, in the increase of about $177,000 in the capital account for services since 1884?

A. That is the case, yes, sir.

Q. Now, Professor Bemis also, in dealing with working capital which the company would require, allowed one million dollars, and stated that about two million dollars more, which would make up a total of three million dollars, might be computed by assuming that the two million dollars, or that some two million dollars due from consumers of gas, was in the nature of a surplus. Is that two million dollars in the nature of a surplus in anyway?

A. In no way in the nature of a surplus, no, sir. It represents absolutely an appropriation of capital in some form or other.

Q. So that assuming a three million dollar working capital, as I understood Professor Bemis to do, no part of it could be made up of those accounts, could it, two million dollars of accounts receivable?

A. No.

Q. Is it treated as a surplus?

A. No, I don't know just exactly how he uses the term, or how he is able to construe that asset as representing a surplus.

Q. The question is whether you are able to?

A. I am not able to in any manner or shape.

At 1:05 P. M. adjourned to 2:15 P. M.

6336 After Recess.

Robert A. Carter resumed.

By Mr. Mathewson:

Q. Mr. Carter, have you read Mr. Hall's testimony?

A. Yes, sir.

Q. And the long paper, City's Exhibit 87, which is in evidence?

A. I have, yes, sir.

Q. Now, the table in this exhibit or report which I will refer to as Marwick & Mitchell's report, perhaps, on page 1433 of the exhibits in this case, states a certain amount in the gas holders of the company, which Mr. Hall takes as his starting point in the computation of gas consumption and gas on hand. Is the amount which he states on hand in the holders, January 1st, 1905, 26,552,000 cubic feet correct?

A. No, sir, it is not correct?

Q. What does he omit?

A. He omits the gas on hand at the 18th Street station.

Q. What items in that exhibit as appearing on page 1433 are therefore incorrect?

A. The statement of the gas in the holder on January 1st, 1905, the total gas to be accounted for, the total gas accounted for and the gas unaccounted for are all incorrect.

Q. And does that error at the outset affect his computations and figures all the way through as to gas on hand and items of consumption?

A. Yes, sir, the tables throughout, to the extent of the error arising from the omission of the quantity on hand at the 18th Street station.

Q. Now, on page 4478, Mr. Hall states that the table in Marwick & Mitchell's report, page 1490 of the exhibit, purporting to show gas on hand manufactured, purchased, sold to consumers and
6337 balance on hand, indicated that during the five months
ending October 31, 1905, that the company sold 421,000,000 feet in excess of the quantity made by the company and made for the company under the agency agreements during that period. Did the company in fact sell that quantity of feet in excess of the quantity manufactured and received?

A. No.

Q. Did they sell any amount in excess of the amount manufactured and received?

A. They did not, no, sir.

Q. What percentage did they make and receive under the agency agreements for those five months more than they sold?

A. The gas made by the company and for the company under the agency agreements, taking into account the variation in the quantity actually on hand, June 1st, and October 31st, exceeded the sales for the five months in question to the extent of 86,521,346 feet, or 1.82 per cent.

Q. Were these facts shown in the books to which Mr. Hall had access?

A. The facts were shown in the books to which Mr. Hall had access.

Q. Now, Mr. Hall added that this assumed excess of sales over make of 421,000,000 feet which you say was incorrect was over half the total sales of either July and August, and that he was unable to obtain any explanation for it. Did he ask you for any explanation for his apparent figures?

A. No, sir, none whatever.

Q. Would it have been easy to have made it if he had asked you?

A. Very easily pointed out, that he had made an error of over 500,000,000 cubic feet of gas in his statement.

Q. Now, as a matter of fact, instead of the sales attributed to any one month exceeding the gas made and the gas received by
6338 the Consolidated Gas Company for four successive months, such apparent excess occurred in how many months?

A. But two.

Q. And those months were?

A. The months of June and July.

Q. Now, will you state whether that excess was large or small and how it could be accounted for?

A. I have a table, Mr. Mathewson, that it might be well to put in evidence.

Q. Very good. Now, did you make copies of them?

A. Yes, there are a couple of extra copies.

Q. The table which you produce shows an excess of sales attributed to the months of June and July over the gas actually made and received for those months of 141,000,000 feet in one case and 80,000,000 feet in another. That in relation to the total gas made is a small percentage, is it not?

A. Quite small.

Mr. Mathewson: I offer that table in evidence.

Table received in evidence and marked Complainant's Exhibit 367.

Q. Now, as to the make in any one month and the gas received under the agency agreements, that is an absolute and known quantity, is it not?

A. The make is an absolutely known quantity; the quantity received is a calculated quantity based upon the sales of the other companies and their make for the calendar month.

Q. But that is definitely figured out?

A. That is definitely figured out, yes, sir.

Q. How is it to the sales which are attributed for June and July, are they the actual sales, are those two calendar months
6339 figured on the exact days of those months?

A. They are not. In both cases the sales cover a nominal month and are not necessarily comparable to the calendar month. The June sales for example would run probably from the middle of May to the middle of June, and accordingly as the temperature, weather conditions and other conditions might vary in the calendar month as compared with the nominal month, it would be reflected in the ratio of sales to the quantity of gas to be accounted for.

Q. In other words, the sales attributed to the month of June are not actually the sales in the month of June?

A. They are not, no, sir.

Q. It is an average covering a part of another month, is it not?

A. Exactly.

Q. Taking the month of July, for instance, that includes so far as gas made is concerned the period of the year when a great many people are out-of-town, does it not, say from the first of July, the vacation period?

A. Yes, sir.

Q. It includes in gas sales, however, about half the month of June, does it not?

A. It does.

Q. When the exodus has not begun or extended to the same point?

A. Exactly.

Q. So far as your experience goes, does any company undertake to reconcile its sales attributable to any particular month with the actual gas made in that month?

A. It is impossible and no one undertakes to do it.

Q. If you were to do so would it not be necessary to read every meter on the same day and such meters to be read on the 30th of June and the 31st of July, for example, to cover the month of July?

A. That would be the case, yes, sir, and it would only be sales covering that calendar period which would be comparable to the calendar month's make.

6340 Q. Is that practically possible?

A. It is practically impossible.

Q. And for the five months you have said, instead of having an excess of sales over make of 421,000,000 feet there is actually an excess of make over sales even on this theory of 86,000,000 feet and more?

A. Yes, sir.

Q. What have you to say as to the accuracy of Mr. Hall's statement on page 4477, that the company had 109,983,736 cubic feet of gas on hand, November 1st?

A. The gas company actually had on hand at that date 27,854,000 cubic feet.

Q. Did that also appear from the books of the company?

A. It also appeared from the books of the company.

Q. Now, the testimony in this case shows that the total of holder capacity of the Consolidated Gas Company was in the neighborhood of 50,000,000 cubic feet, so that Mr. Hall's statement of gas on hand would be something more than double at that period the entire holder capacity of the company, would it not?

A. Yes, sir, in that period, and on December 1st when it is made to appear that there are 196,000,000 cubic feet on hand, it is nearly four times the entire holder capacity of the company.

Q. Now Mr. Hall in his testimony refers I think to one item of the company's expenses as being excessive, that is to say meter repairs or expenditures at the repair shop. What is the fact as to that?

A. In making such comparison, Messrs. Marwick & Mitchell in-

clude as a part of the cost of repairing meters the item of meter shop expense, and they get a total which divided by the average number of meters in use during the year 1905 gives 58.56 cents as the cost per meter in use, for repairs. That they compare with
6341 the alleged cost shown in the Massachusetts Report of 49
cents and invite attention to the higher figure in the Consolidated Company. As a matter of fact, the meter shop expense has nothing whatever to do with the cost of repairing meters. The expense of the meter shop, fitting shop, deals with the care of customer's complaints and the locking and unlocking of meters, the clearing services and attending to work of that nature, and work of a jobbing character, and has nothing to do with the repairs to meters. The item in Exhibit 94, repairs to meters, costing $172,925.52 and figuring out 45.25 per average number of meters in use during the year 1905, is the actual cost of repairs to meters and is lower than the figure which they quote as appearing in the report of the Massachusetts Gas and Electric Commission.

Q. In other words, comparing it with the same item which is referred to in the Massachusetts Commissioners' report, is the Consolidated cost higher or lower than in Massachusetts?

A. It is lower. I might add in that connection that the Consolidated Company repairs its own meters as a measure of economy, and that during the year 1905 saved by this scheme $52,717.57 as compared with what the company would have had to pay to outside companies to make similar repairs at the scheduled rates which they charge.

Q. Now, in the summary of accounts excluded by Marwick, Mitchell & Co., at page 1432 of the exhibits there appears an item, "Legislative and franchise litigation," stated to be .61 cents, and on page 1462 is a table showing the advertising and legal expenses in one column, and amounts rejected in another, and the amounts approved in a third. In the column headed "amounts rejected" ap-
6342 pears a total of $63,401.65. Do you discover any error in
computing this .61 cents?

A. I do, yes, sir. On this page 1462 and the succeeding page the amounts which Marwick, Mitchell & Company reject are given in some detail. Five items aggregating $63,401.65, one of which is called actual payments excluded, amounting to $15,528.57. Dividing the amount $63,401.65 by their sales factor of 13,012,384,000 cubic feet, gives a rate per thousand of .49 of a cent. Adding for a second time the item of rejection of actual payments, $15,528.57, gives a total of $78,930.22, which being divided by the factor of sales gives a rate of .61 cents.

Q. Which is the cost per thousand which they state?

A. Which is the cost per thousand which they state, and it is obvious that the item of $15,528.57 was included twice in their statement of the amounts excluded.

Q. And if it had not been included twice, the amounts that they excluded for this particular item would be correspondingly reduced?

A. It would, yes, sir.

Q. Now, respecting this factor of sales by which they divide, what did it appear to be?

A. It is the balance of sales left after deducting from the sales reported in Exhibit 94, 13,283,163,000 cubic feet less the lamp sales reported to have been as estimated on the basis of 3 cubic feet per lamp per annum, 270,779,000 cubic feet, the balance, 13,012,384 cubic feet, they used as a volume of sales in arriving at their cost per thousand.

Q. You have already testified that the lamps burn more than three cubic feet per annum, therefore, the item of 270,779,000 cubic feet for public lamps is too small. But waiving that point, is it
possible to reach any intelligent results by dividing the
6343 operating expenses as shown in Exhibit 4 by the amount of
gas sold, less the amount sold in the city?

A. There is no theory, as I understand it, upon which the lamp sales could be deducted. The expenses shown in Exhibit 94 include the cost of gas delivered to the city, and the income statement of the city shown in Exhibit 96 includes the revenue from those lamps. Even after deducting the amount of maintenance of those lamps, shown in Exhibit 94, there is still left the revenue the company receives from the city for gas supplied to public lamps. Therefore, both in the expense and revenue there still remains the cost of and the revenue from sales of gas to the public lamps, and therefore, to divide the expenses and divide the revenue by such a factor would give results which would be purely erroneous and misleading.

Q. Is that the course which was pursued in this report?

A. That was the course which was pursued in this report.

Q. Now, Messrs. Marwick, Mitchell & Company report in this exhibit a cost which they say is 52.5 cents per thousand cubic feet after making these various deductions which are questioned. What is that 52.50 per thousand cubic feet, per thousand cubic feet of make, sales, or what is it?

A. The amount of 52.50 per thousand cubic feet which they say is the cost per thousand of $6,922,738.34 on page 1438 of their report, is not an amount that would be obtained by dividing that amount by any factor of sales by them or by the company.

Q. Neither by gas made or sold?

A. Nor anything else.

Q. To get one part of that they divide, do they not, certain ex-
penses of manufacture to the station by what they call the
6344 gas made after deducting some leakage, or how is that ob-
tained?

A. Well, I would be loath to undertake to describe how they got that 52.50 because it would be too complicated for anyone to understand it, and it would not be a factor that any practical gas company would use in their own practice, because it would be utterly misleading, being based upon no factors that the company uses in its sales.

Q. At any rate, it is safe to say that it is not 52.50 cents per thousand of feet sold, even on their own theory?

A. It is not, no, sir.

Q. Now, in reference to the legal expenses which they exclude, as attributable to franchise tax litigation or the expenses connected with the legislative investigation, are such charges as those unusual charges in your experience with gas companies?

A. No, sir, they are not.

Q. Those expenses are said to be in connection with the legislative investigation of 1905. How about the hearing before the Gas Commission of 1905-6. That would appear in the expenses of 1906?

A. Yes, sir.

Q. And the expenses of the present suit would appear perhaps in 1907?

A. Quite likely.

Q. And your franchise litigations have been proceeding since about 1899 or 1900, have they not?

A. Yes, sir, they have.

Q. And if such expenses of litigation as advised by counsel are not borne and charged as part of operating expense, do you know of any account in which they could be charged?

A. No, sir, I do not.

Q. What is your judgment as to the propriety of excluding those charges in operating expense?

A. There is no theory that I know of, Mr. Mathewson, in which they could be excluded or on which any company excludes them.

6345 Q. Do you know of any case in your knowledge where they have been excluded as operating expense?

A. No, sir, I do not.

Q. Or similar charges, I mean?

A. Or similar charges.

Q. Now, another point to which I call your attention, Marwick, Mitchell & Company in this exhibit include in their items rejected the sum of $1,850.31, being, as they state, the cost of certain expenses and increases to services in the year 1905, alleging that they should have been charged to construction account. That amount if I recall is so small that it is said it could not be expressed in cents per thousand and was not expressed by them.

A. It was not expressed by them.

Q. But there is a principle there involved and I would like to have you explain as to that item, and your view as to the propriety of excluding it.

A. The only theory upon which they could be excluded from the operating expenses would be that it was a replacement of an old service with a new one, in which case the value of the old service or the value at which it was carried in our books would have to be charged to depreciation account as an offset to the charge of construction of the new service. As a matter of fact, most of the extensions are made in the course of overhauling in advance of new pavements, and are made from the main to the curb line, a portion of the service only, and we estimate that the expense attending the change in the size of the service would just about offset the amount which we would charge to depreciation if we charged that to construction, therefore we make a short cut and charge it to expenses.

6346 Q. Is there any material difference in the result to be obtained.

A. None whatever.

Q. Now, as a layman, let me see if I understand. These services include the cost of laying them under the old pavement and they stand on your books?

A. That is the case, yes, sir.

Q. And if an entire service is abandoned, it is charged out entire at the cost at which it appears on your books, is it not?

A. That is the case, yes, sir.

Q. But you say that in cases where it is proposed to repave a street and where the city I assume has removed the pavement, you then put in an extra joint, say, from the pipe to the sidewalk, and that is charged to repairs?

A. That is charged to repairs.

Q. And you do not have the expense of putting pavement in in that case and repaving?

A. No, sir.

Q. If it were to be charged in another method, we will assume that the cost of the pipe laid would be $4 and that the cost of the pavement originally $1, that would be $5 and it would appear on your books at that figure. If you were charging it to replacement, how would you charge it? You would charge $5 to depreciation, would you not?

A. Representing the value of the service that was in the ground before.

Q. And you would then charge $4 to replacement?

A. Then charge $4 to construction in that case.

Q. And that would amount to a replacement less $1, and reduce your capital account $1?

A. That would be the case.

Q. Instead of that you simply charged——

A. The $4 to the repair account, instead of $5.

Q. And if your pipe, being a larger pipe as you say it is,
6347 in place of the old pipe, cost $5 instead of $4 without any
pavement, then if you went through the form of replacement, you would carry $5 to depreciation and $5 to construction, meaning the new and larger pipe without pavement?

A. Exactly.

Q. And it would leave your capital account exactly where you started, would it not?

A. It would exactly.

Q. And when you charge it to repairs you charge the $4 likewise to repairs and have your capital account left intact as it was originally, is that it?

A. Precisely, that is the case exactly.

Q. Is it therefore merely a mat-er of bookkeeping as to which way you treat it in a case of this kind?

A. Purely a matter of bookkeeping.

Q. Have you on your books as a matter of fact just exactly what that particular one joint cost, although you have the cost of the entire service in your books?

A. We have not.

Q. So you could not charge a replacement unless you made a particular estimate for that charge?

A. A particular estimate which would be an arbitrary one.

Q. Now, the amount which Messrs. Marwick, Mitchell & Company have stated is, as you say, negligible as applied to cents per thousand. Would the effect upon capital account in any conceivable circumstances be substantial?

A. No, it would not.

Q. As a matter of fact has not the accountant in this report included operating expense charges of substantially similar import?

A. Exactly the same kind of charges where the company has made a small extension from the service to the house risers to enable them to connect the meter, and supply a customer,
6348 charges of that nature have been accepted by the accountants,
and they are included in the cost of jobbing, shown in Exhibit No. 94.

Q. It is in evidence that the assessed value of the land of the company in the Borough of Manhattan is $9,753,000, isn't it?

A. Yes, sir.

Q. And what do Marwick, Mitchell & Company take as the valuation of that real estate in their computations?

A. They find the value as shown by the books of the old company $3,377,971.10, and the additions to December 31, 1905, $740,296.28; a total of $4,118,267.38.

Q. Marwick, Mitchell & Company included in their rejections amounts aggregating $2,222.48, which is equivalent to about .02 of one cent per thousand feet sold by the Consolidated Company, stating that it was, price of repairs to apparatus, $2,133.98, and repairs to buildings $88.50. What are the facts regarding those items?

A. Well, I have examined all the vouchers submitted to me by Marwick, Mitchell & Company referring to the first item of $2,133.98, and I find that in every case the vouchers attached—the station vouchers attached to the bills, indicate that the material charged for was intended for use in repairing apparatus, and I have no reason to doubt those statements were correctly made.

Q. So far as your investigation shows there is nothing to indicate that the items represent anything else than the books state?

A. Nothing whatever; no, sir.

Q. Now as to the small repair on buildings, $88.50, while the amount is negligible as a matter of fact, is not that the cost of repairing buildings against which you have a certain receipt for rent?

A. Yes, sir, shown in our statement of miscellaneous income, Exhibit 96 in this case.

6349 Q. And all the witnesses, even for the defendant, take the receipts from building rents and deduct them, do they not, from the operating cost of gas?

A. Yes, sir; they do.

Q. Do you know of any other theory in which in that case you can exclude the repair of buildings from operating expenses?

A. Under no theory that I can think of.

Q. On page 4472 and 4473 Mr. Hall testified over objection of complainant's counsel that he was not an expert, that in his opinion the amount expended for renewals in 1905 was sufficient to keep the plant in thorough state of efficiency and replace all waste which may have taken place during the year, and that the depreciation was provided for in the amount written off during the year 1905?

A. We expended for renewals to plant $3,424 in 1905.

Q. And what in 1904?

A. $259,244.32.

Q. What have you to say as to the opinion or statement of Mr. Hall that this expenditure for renewals of plant was sufficient as an average amount to keep the plant in repair?

A. Absurd on the face of it.

Q. Mr. Hall also commented on a charge of 10% on certain work done for consumers, referring particularly to bills rendered by Schmitt Bros. for conducting Manhattan heaters, stating that that was a profit and should not therefore have been charged into expenses. What is the fact as to that?

A. The fact is that Mr. Hall handled a great many of Schmitt's bills and must have observed that an additional charge of ten per cent. was only made in a few instances, not over half a dozen, and the facts with respect to those additions are that in all those 6350 cases the company was put to some expense in connection with the installation of appliances by Schmitt Bros. The expense the company was being put to was for preliminary survey, planning, drawing plans, supervising the work, and expenses of that character which were not more than covered by the amount added to Schmitt's bills.

Q. Therefore was that ten per cent. profit, or did it represent actual expenses?

A. It represented actual expenses; not a penny of profit in it.

Q. Now in the case where there was no such expense incurred was any addition made to Schmitt's bills?

A. None whatever.

Q. Was that also apparent from an examination of the vouchers which Mr. Hall had before him?

A. It was apparent, yes, sir.

Q. Mr. Hall also excludes interest on consumer's deposits, $51,392.50. What is your view as to the propriety of that exclusion?

A. I do not recall that Mr. Hall assigned any particular reason for excluding it. We are of the opinion that we save a great deal of money by charging consumers deposits and that the item of interest is properly an item of expense as it operates to reduce the loss from bad debts which would be very considerably higher if we were not protected by deposits, as well as reducing in our opinion the cost of collecting to some extent. I have made an estimate based upon our operations during 1905 in connection with the deposits and I calculate that we saved during the year 1905 by charging deposits, something like $191,000 of bad debts.

Q. Is it possible or practicable in the gas business to have a deposit charged against the consumer which shall cover any possible charge from that consumer and still conduct your business in
6351 a proper manner?

A. It is impossible from two standpoints: There are a great many consumers of gas from whom it would be absurd for the company to attempt to get a deposit to secure their account. The company has to exercise a great deal of judgment and a great deal of care in that particular branch of the business, and in using its best judgment there are consumers of supposed perfect responsibility who are allowed to consume gas without a deposit who fail to pay their final bills. In the matter of the amount of the deposit charged we have to be careful in that respect also, and of course in estimating the amount that a consumer will burn there may be an under-estimate, and sometimes is, of his consumption, and he is able to perhaps get ahead of the company to the extent of a month's bill.

Q. What is the character of the population of New York with which you deal which makes this situation difficult, as to transients?

A. I don't suppose there is another city in the country that compares with New York in respect to the number of transient residents, made up largely of foreigners or people who spend a short time in New York and leave again, or remaining in New York are shifting constantly from one place of residence to another.

Q. From your information and experience what would you say as to the loss from bad debts in percentage for the Consolidated as compared with other enterprises?

A. I think it is remarkably small.

Q. Even so, isn't it a fact that bills were introduced in the Legislature to compel us to return our deposits?

A. There have been such bills introduced and I noticed in the New York *Times* of January 21, 1907, there is reported a bill
6352 introduced by Assemblyman Eagleton reducing the amount of deposits a company can charge to the amount of one month.

Mr. Burr: This is entirely improper. I think it has no bearing on the present situation.

Mr. Mathewson: It simply shows you have to conduct the gas business, as every other business, with some reason, some intelligence and with some regard for your consumers, and you cannot run it on theoretical lines.

Mr. Burr: That is exactly what we have been insisting upon throughout this whole case.

Mr. Mathewson: Then we are entirely in accord.

The Master: Proceed, gentlemen.

Q. Messrs. Marwick, Mitchell & Company in computing the cost of the gas sold by the Consolidated Gas Company deduct from the charges made by the companies operating under agency agreements the 10 per cent. above cost of labor and material, and also certain interest paid to the New Amsterdam Company on the new construction at Ravenswood. As a matter of fact was not that Ravenswood construction made for the express purpose of helping the Consolidated out in its requirements?

A. Yes, sir, it was.

Q. Now, the Consolidated Company within the last few years has suffered curtailment of its productive capacity, hasn't it, through action of the city?

A. It has, conspicuously at 18th Street.

Q. Wasn't part of the 111th Street plant taken?

A. It was; taken by the city some years ago.

6353 Mr. Burr: That has all been gone over in the former examination of witnesses for the complainant.

Q. Assuming that this 10 per cent. over cost of material and labor paid to the other companies under the agency agreements, and said interest to the New Amsterdam Company, were deducted, would there not be certain distributing expenses which the Consolidated Company would have to meet before the gas goes into their mains?

A. There would be, as shown by Exhibit 94.

Q. Amounting to how much per thousand feet?

A. I should have to consult that exhibit. I have made a calculation showing that if from the 10 per cent. over cost of material and labor paid the other companies and the interest paid to the New Amsterdam Company, if from that sum there be deducted the station and distributing expenses at the rate per thousand shown in Exhibit 94 for these items for the Consolidated Company, calculated on the amount of gas manufactured under the agency agreements, the balance if it were assumed that it all represented earnings on capital were to be excluded from the cost of the gas made for the Consolidated Company, it would amount to .78 of one cent per thousand cubic feet of gas sold by the Consolidated during the year 1905.

Q. It is also suggested in Marwick, Mitchell & Company's report and in Mr. Hall's testimony and Mr. Mark's testimony that the charge for depreciation or renewals, whatever you please to call it, as shown on the company's books for 1905, amounting to $282,000 was 2.12 cents per thousand feet, or was an amount arbitrarily fixed by the Board of Trustees. Is that the fact?

A. It is not the fact. The authorization did not operate
6354 to create any charge to the depreciation account at all. It simply authorized the transfer of the balance in the depreciation account as of December 31, 1905, to the renewal and contingency account.

Q. Was not the entire $282,000 already charged in the company's books before the Board of Trustees took any action at all on the subject?

A. It was all charged during every month of the year 1905 and the detail of the charges are shown in Schedule 1, Exhibit C, of Marwick, Mitchell & Company's report, covering six type written pages, giving in detail the entries made in the depreciation account, aggregating for the year the amount referred to, $282,000.

Q. Did the resolution of the Board operate to any greater extent than merely to have that $280,000 already on the books charged into a particular account.

A. It had no other effect whatever, nor was it designed to have.

Q. Has the Board of Trustees of the Consolidated Gas Company at any time fixed any arbitrary amount or any cents per thousand which should be charged for renewals and contingent except the ten cents per thousand to which reference has heretofore been made?

A. They have never made any other provision than that.

Q. And have they ever taken any action or has the Executive Committee taken any action establishing 2.12 as the proper amount to be expended for renewals or charged to depreciation in any year?

A. No such action has ever been taken.

Q. Marwick, Mitchell & Company, in this report reject for the year 1905 the sum of $59,836.85 out of the total of $282,000 leaving a remainder of about $222,000 or 1.71 cents, which they allow for depreciation in that year. What does this $59,836.85
6355 represent?

A. It represents the value of certain mains which were abandoned in December, 1905, but which as they were disused in 1903 and 1904, Messrs Marwick, Mitchell & Company excluded from the total depreciation for the year 1905.

Q. Now, as a matter of fact when a main is abandoned and when the company gives up its use, it is marked off the books, isn't it?

A. That is the case, yes, sir.

Q. Were these mains so abandoned until 1905?

A. They were not.

Q. If you cut a main out temporarily on account of the building of salt water mains or for some other purpose it is merely marked "disused" isn't it?

A. That is the case.

Q. And is it still a part of the assets of the company, ready to be used at any time?

A. It is, yes, sir.

Q. Were these mains in that condition in 1903 and 1904?

A. And up to December, 1905, yes, sir.

Q. If, however, they were to be charged back into 1903 or 1904 that would not affect, would it, the average expenditures for renewals and repairs for the twenty years?

A. No, sir, it would not.

Q. It would merely mean that the difference in 1905 between the reduced amount and 10.89 which was the average for twenty years would still be added——

A. It would; the difference would be so much greater than if they left it in.

Q. It would not affect the computation in the slightest, would it?

A. Not in the slightest, no, sir.

Q. Mr. Hall has also commented and possibly one of these other witnesses in reference to the handling of new materials and supplies account and suggested that you might be more certain of
6356 their use if they were treated in some other way in the accounts. What have you to say to that suggestion?

A. There seems to have been a misunderstanding on Mr. Hall's part as to the company's method of dealing with material and supplies. My statement to Mr. Hall was that when materials were purchased for a specific purpose they were so charged on the books of the company instead of being charged first into a stock account and then charged out again as they were used. I also stated to Mr. Hall that if material purchased for a specific purpose were used for any other purpose than that for which it was purchased a report was made to the general office and proper entries made in the books to have the materials finally charged to the account where it was finally employed.

Q. Does that operate to make your accounts any less certain, or your information any less exact as to the using of the material?

A. Not at all, because no additional protection would be afforded by dealing with the material in any other way. Entries on the general books are no protection against misappropriation of property. If the superintendent should mislead us to the extent of sending in a requisition for material that he did not require he would be quite capable of following that up with the report that the material had been employed, so that as far as the books were concerned they would record everything very properly from the accounting standpoint, though the material may never have been used for the purpose for which it was supposed to have been used.

Q. Do your reports show what material is used for repairs and what for construction?

6357 A. The requisitions and the report of the receipt of the material indicate that the material is to be used either for construction or repairs and in every case states specifically what employment is to be made of it.

Q. Is the method you employ peculiar to the Consolidated Gas Company or is it employed by other corporations of standing?

A. It is very generally employed. As a matter of fact we take perhaps more care of some materials than is general in very large concerns handling a great deal of material for manufacturing purposes.

Q. Do you happen to know whether such a company as the General Electric Company abandoned recently this theory which is advocated by Mr. Hall?

A. I had occasion to visit——

Mr. Burr: I object to that.

The Master: That is objectionable, Mr. Mathewson.

Mr. Mathewson: Very good.

Mr. Burr: I have not objected to all the leading questions that have been asked because I thought it would consume too much time, but all this line of examination is leading.

The Witness: I might say in that connection that Mr. Lacombe and Mr. Hall visited the shops and departments and reported that they found that the records of the use of material were very carefully and correctly kept.

Q. Mr. Hall states at page 4418, regarding the cost sheets of other companies that furnish gas to you under the agency agreements that you simply held it up before him and would not let him take a copy. Is Mr. Hall accurate in that statement?

A. Quite inaccurate.

6358 Q. Did he ever ask you for a copy?

A. Personally, never, except by mail. He wrote me a letter asking to be shown those reports.

Q. Did a representative of his appear and ask you for them and did you show them to him?

A. Mr. McMurtry, representing Mr. Hall, called and asked to be shown them and they were shown to him and he had them in his hands in my office for something like twenty minutes.

Q. Did he make any demand on you, or request, for copies or for the privilege of copying?

A. No demand or request for copies or for the privilege of copying was made.

Q. Now in regard to the keeping of your accounts as to renewals and replacements and depreciation, Mr. Marks has testified that the depreciation, referring particularly to 1905, does not represent actual expenditure. As a matter of fact does the depreciation account ever represent an actual expenditure in itself?

A. A depreciation account never does record actual expenditure; it represents the writing down of depreciated property.

Q. Which is abandoned or lost or something else?

A. Yes, or superseded or obsolescent or antiquated or many other things.

Q. As a matter of fact where do the expenditures appear which offset that depreciation?

A. The expenditures which offset the depreciation appear in the construction account.

Q. Now I showed you Complainant's Exhibit 79 in this connection. Taking the item of plant, I find the third column "depreciation (renewals) since consolidation $1,227,683.10," does that represent the charge for depreciation on account of abandonment, of loss of property of one kind or another, under heading of plant.

A. Yes, sir, it does.

6359 Q. On the other hand how much was expended to replace in that property account that amount of plant?

A. $1,227,683.10.

Q. Precisely the same figure?

A. Precisely the same figure.

Q. And therefore you have put "renewals" in parentheses as the heading?

A. Yes, sir.

Q. And the balance of construction $3,904,937.21 goes to what account?

A. Goes to construction account.

Q. Now if you look down there, is it not a fact that in every instance and as to every class of property, depreciation has been charged down and expenditure made for an equal amount to renewal in your property account for the amount of property so lost, with a single exception of possibly "furniture and fixtures?"

A. That is the case with every item appearing in Exhibit 79.

By Mr. BURR:

Q. You do not mean to say you include in every item franchises and rights?

Mr. MATHEWSON: That is down at the bottom here. There are no columns of the character to which I have been referring relating to the franchises and rights.

The WITNESS: No depreciation shown for that item.

Mr. MATHEWSON: The State Board of Tax Commissioners don't seem to think there has been any.

By Mr. MATHEWSON:

Q. So taking each one of these items, plants, mains, services, meters, etc., which appear on exhibit 79, is it true that the column headed "Depreciation (renewals)," does not in that way represent actual expenditures? 6360

A. It represents actual expenditures in every case except the items stated were the expenditures for new property have not equalled the amount by which the property has been depreciated, in the matter of office furniture and fixtures.

Q. If a main is abandoned on one side of Wall Street and a larger main is put down on the other side of Wall Street, is it in your judgment any less a replacement of mains because this is not put in the exact spot?

A. Decidedly not; no, sir.

Q. As a matter of fact may not replacement sometimes precede the abandonment of the main where you lay one large main before you abandon a small main which was formerly used?

A. It may, and not infrequently does.

Q. Does that affect the validity of the bookkeeping or the propriety of it in any way?

A. No, sir, not a particle.

Q. Have you any modifications to make of your previous testimony that these columns of "Depreciation (renewals)," and of "Amount Expended in Repairs," as shown in complainant's exhibit 79 are absolutely accurate and show absolute money spent.

A. I have no modification to make.

Q. I observe that in Marwick, Mitchell's report, gas on hand is dealt with at various times. What is the practice of the company as to keeping exact statements of that character?

A. While we know at seven o'clock every day in the year what quantity of gas there is on hand we do not treat with it in our accounts or in our statistics, and it would only be useful to such a company as you described a little while ago, one that could index all its meters on the last day of the month and know exactly the sales as compared with the output, would find the record of gas on hand, especially if they had a large holder capacity, of some use to them. 6361

Q. Now as a matter of fact, in the case of the Consolidated Company, can the difference between the quantity on hand at the beginning and at the end of the year be of any subtantial importance when taken in connection with the total output?

A. The difference in the year 1905 between the quantity on hand at the beginning and end of the year amounted to about 2/1000 of one per cent.

Mr. Hall in his testimony and also in Marwick, Mitchell's report to which I have referred, figures up certain property amounting to $20,942,000 and also furnishes a statement of certain land which appeared on the books of the constituent company, showing the present value on the books of the company as compared with the value on the books of the six constituent companies. As a matter of fact, does not the land which appears on the books of the company at present include some parcels that have not appeared in Marwick, Mitchell & Company's statement of the land of the six constituent companies?

A. Yes, sir.

Q. Which?

A. The land which belonged to the Knickerbocker Gas Light Company and which was transferred to the Consolidated Company in 1884, as shown by the schedules in Marwick & Mitchell's report, was not included in the accounts of any of the companies which either Yalden in 1884 or Marwick & Mitchell in 1905 had access to. In other words, they were not shown on the books of the Municipal Gas Light Company.

6362 Q. In other words, the real estate, that is the land plus any office buildings on part of the manufacturing or distributing plant of the Knickerbocker did not appear at all, did it, on the Municipal Company's books?

A. Not all, no, sir.

Q. Now Marwick, Mitchell & Company in their report show all the land including that, do they not, as at present valued on the books of the company?

A. Well, I am not aware that anywhere in their report they show the actual value of the company's real estate except as they have copied and embodied in their report the schedules of the real estate which was transferred to the Consolidated in 1884.

Q. But in their computations showing the real estate of the six constituent companies and comparing it with the company's real estate now they do not in the first instance, do they, include this Knickerbocker real estate at all?

A. They do not include the Knickerbocker real estate at all, no, sir.

Q. And that makes any difference between the present values and the values of 1884 inaccurate, doesn't it?

A. The amount at which the real estate of the Knickerbocker Company was appraised in 1884, which was $595,000.

Q. Do the records which they have show that real estate was not included in the records of the books of the five constituent companies that they examined?

A. The records plainly indicated that the real estate of the Knickerbocker Company was not included in the real estate of the Municipal Gas Light Company. In other words, all the real estate they found of record and on the books of the Municipal Gas Light Company was the real estate described as being located at the North River, between 44th and 46th streets, and the real estate transferred 6363 to the Consolidated Company included real estate of the Knickerbocker Company described as bounded by East 98th and 99th Streets and Second Avenue and the Harlem River and appraised at $595,000. No such property was shown on the books of the Municipal Gas Light Company.

Q. Now, as a matter of fact, the Consolidated Gas Company has not the books of the Knickerbocker Company, have they?

A. No, sir, never had them.

Q. Does it not appear by the Senate Document 47 of 1884 that Mr. Yalden did not have those books?

A. It does so appear.

Q. Did you furnish Mr. Hall all the books that the company actually has or owns or has control of?

A. Yes, sir.

Q. Relating to the six constituent companies?

A. Yes, sir.

Q. Referring to the figures shown in Marwick, Mitchell & Company's report, pages 1503 to 1511 of that report, how do you find the manufacturing averages are made up?

A. They are made up throughout by adding the monthly averages and dividing by twelve instead of using the totals of the two factors that enter into the average in arriving at the average for the year.

Q. Does that represent a true or correct average?

A. No, it does not.

Q. They refer to 14th street labor as 51,765 days. What are the actual number of days?

A. 54,583 days.

Q. That is, the statement is less than the fact by how many?

A. 2,818 days' labor.

Q. Do you find that they have included or omitted the purifier labor there?

A. They have excluded the purfier labor, but have ac- 6364 cepted the gas made per day's labor notwithstanding such exclusion. Of course their figures then would not work out.

Q. It would not give any proper result?

A. No, sir, it would not.

Q. Now as to the 42nd street station theirreport shows 17,508,000 cubic feet of oil gas received from the 14th street station. Does that represent the fact?

A. It is not a fact. No oil gas was delivered there by the 14th street station. They received ordinary gas from the 14th street station.

Q. Oil gas is merely that made at 21st Street and sent down to 14th Street to enrich the coal gas, isn't it?

A. That is the case, yes, sir.

Q. How about 42nd Street labor; do youfind they have included their purification labor in that?

A. In that case also the purification labor seems to have been omitted.

Q. At 21st Street they say 9,570,300 cubic feet under the heading of "candle power." That is, of course, a clerical error, but what should it read?

A. It should read "Croton Water."

Q. Referring to the 21st street station, April, 1905, do you find that they have included all the gas making oil in making up their figures?

A. Their statement of operations at 21st Street excludes 5,587 gallons of naphtha employed in gas making at that station in April, 1905.

Q. They show the oil used per thousand feet in two columns. What errors do you discover there as between April and September?

A. In April there is an error in the gallons of oil used per thousand arising from their omission of the naphtha that was used in that month, already referred to. They get an incorrect average for the year from any standpoint. We were unable to check their figure 4.65 gallons per thousand cubic feet. It don't check in any
6365 way. The next table showing the gallons per thousand, showing the total of 4.61, is correct, except of course as to April again they make a mistake by excluding the naphtha as already referred to.

Q. Now, at the 21st Street station, in delivering your production, do you find that they include in their computations the tar burned under the boilers during January, 1905?

A. No. Their report shows no weight of tar in January, 1905, although directly under the column where it should appear there is a quantity expressed in gallons of 320,020 gallons of oil used during that month, therefore that January omission is incorrect and that total for the year is incorrect.

Q. Now, at 44th Street is there any omission in their report of oil tar used during February?

A. An omission of 8,608 gallons of oil tar used during February, 1905. The figure shows 198,018 as being correct. The correct quantity is 206,626 gallons.

Q. How about the 44th Street plant, in their report do they show the entire labor there employed.

A. Their statement of labor is incorrect. The number of days would be 12,555, instead of 7,713. As they are shown in their statement the cost of a per day's labor while correct in other respects is incorrectly averaged.

Q. Now, before leaving a review of Mr. Hall's testimony in this report, I call your attention to the testimony of the witnesses for the defendant that it was a proper method of bookkeeping, to charge off to depreciation any property lost, abandoned, or taken out of the property accounts of the company; is that the method used by the Consolidated Company?

A. Yes, sir.

6366 Q. And they also agreed that it was proper to charge into property account any expenditures for construction; is that the course which the Consolidated pursues?

A. Precisely.

Q. And so far as those expenditures offset or equal the amount of property charged off to depreciation they appear in effect in your accounts and in fact as renewals of property lost, do they not, or replacements of property lost?

A. That is the case, yes, sir.

Q. Has there been in fact, as suggested might have been the case by one or two of the witnesses for the defendant, any increase or augmentation of the property or capital account of the company except as it may result from the method of bookkeeping which I have just called your attention to; that is, construction more than offsets the depreciation already charged off?

A. Nothing of that kind.

Q. In other words, has there been any increase out of earnings?

A. None whatever.

Q. Mr. Hall refers to certain adjustments (p. 1432) .16 of a cent, and he introduces that as a factor in the cost of gas. Are you able to ascertain just what that represents?

A. It was impossible to do so, but I presume it is intended to cover the omission of several items which appear in the statement, page 1437 of exhibits aggregating .31 of a cent, which are not included in the statement on page 1432 although as items rejected are obviously intended to be excluded in that statement, it is not an amount which is divisible into any component part nor the cost per thousand on any volume of sales used by Marwick, Mitchell, or the Consolidated Gas Company in any of its computations.

6367 Q. Referring now to Mr. Edgerton's testimony, he makes a comparison of the oil tar used by the New Amsterdam Company and the oil tar produced by the Consolidated Company, apparently showing the amount produced by the New Amsterdam is about one-half as much as that produced by the water gas plants of the Consolidated; is that right?

A. That is the case, and it occurs on page 4874 of the printed testimony.

Q. Is that correct?

A. It is not correct. The quantity of oil tar shown in State's Exhibit III, is the amount of oil tar sold by the New Amsterdam Company during the nominal year ending October 31, and is not the quantity produced during that period, and one-half of the tar produced by the New Amsterdam Company was used as fuel.

Q. Comparing the total amount produced by the New Amsterdam Company to the total amount produced by the Consolidated Company there is not any substantial difference, is there?

A. No substantial difference whatever between the two.

Q. Mr. Edgerton is made in the testimony to refer to the 42d Street oil tar, that it is representing 33 per cent. of the oil used?

A. He stated that the oil tar used by the Consolidated Gas Company by the bench process was 33 per cent. of the gas used. As a matter of fact, there is no oil tar produced by the bench process. There is a drip oil produced used for fuel under the retorts of which no record is made and none kept, and therefore, no figures available to which Mr. Edgerton could have access, and from which he could not have drawn any such conclusion.

Q. Are you able to point out to him where he did draw such conclusions from?

A. Yes, sir, at 42d Street there was recorded in the manufacturing records to which Mr. Edgerton had access, during the last six months of 1905 the coal tar that was produced at that station, and the
6368 coal tar produced during that period amounted to 652,171
gallons, representing 33 per cent. of the gas oil that was used at that station in enriching the coal gas made there. The two, however, had no relation whatever to each other. The coal tar produced has nothing to do with the gas oil used for enriching coal gas, but we are of the opinion, however, that these figures must have been used by Mr. Edgerton as there were no other figures in any of our records that would show any such 33 per cent. from any computation whatever.

Q. Well, that 33 per cent. would not mean anything, would it?

A. It would not mean anything, no, sir.

Q. Mr. Edgerton stated that so far as he knew there had been no particular change in the cost of materials for seven years. Do you know whether there has been or not?

Mr. Kirby: What reference was that?

Mr. Mathewson: I haven't the page.

A. He did make that statement and I took the trouble to look up the prices at that page for anthracite and bituminous coal in 1899, and found that it was for anthracite coal, \$3.35 a ton against \$4.36 a ton, paid in 1905, an increase of \$1.01 per ton, or about 33⅓ per cent. In the case of bituminous coal in 1899 the price was \$2.38 against \$3.18 in 1905, an increase of 80 cents per ton, or about 33 per cent.

Q. Mr. Edgerton also made at page 4873 some comparison between the cost of manufacture at the Consolidated water gas plant and the cost of manufacture at the New Amsterdam plant, stating
the Consolidated to be 31.05 and the New Amsterdam 29.01
6369 cents per M. of make. Did he compare the same periods in
those cases?

A. I am not able to establish the fact that he did. The average cost which he states for the Consolidated water gas stations, 31.05 per M., is incorrect. The cost for the nominal year ending October 31, 1905, which is the same period as covered by the New Amsterdam statement, is as follows:

	Gas Made.—cu. ft.	Cost.
21st Street Station	4,185,341,000	\$1,341,188.50
44th Street Station	2,263,444,000	695,539.20
99th Street Station	1,401,538,000	420,938.42
	7,850,323,000	\$2,457,666.12

Equal to 31.50 cents per thousand cubic feet made. To make a comparison with the New Amsterdam Company it would be necessary to deduct from this total the items of experiments and depreciation, there being no corresponding items of expense in the New Amsterdam; they amount to $53,599.03, equal to 68 cents per thousand cubic feet made, leaving a balance of $2,404,666.19 or 30.62.

Q. To compare with the New Amsterdam cost of 29.01?

A. A difference of 1.61 cents.

Q. As to this item of depreciation you heard or read the testimony of Mr. Doane of the New Amsterdam Company in reference to their practice when property was lost, did you not?

A. Yes, sir. I know that Mr. Doane testified it was the practice of the New Amsterdam Company to charge all the renewals and replacements to construction account and not to charge anything off for depreciation. It is generally understood that the line between repairs and renewals may be drawn very fine, so it is even possible that repairs may get into construction account.

6370 Mr. MATHEWSON: I am referring to his testimony in the New Amsterdam case where he said they charge everything to construction and did not charge anything to renewals, for he said they could not afford it and within two or three years they were losing money and not paying their operating expenses.

Mr. BURR: Mr. Doane was here. You did not examine him with regard to that. You are reciting now the substance of what you claim was his testimony. You should produce the testimony here and call Mr. Carter's attention to it. I do not know what testimony you refer to. I was not a party to that case. I object to it further as not being proper rebuttal.

Mr. MATHEWSON: It is page 370 and following of the printed New Amsterdam case.

Q. Now, considering this difference of 1.61 between the New Amsterdam cost and the Consolidated cost, would that be a difference which in your judgment might not occur in the operation of the plants in the same town if there was nothing special to explain the difference?

A. Why, yes, sir, I think it would be difficult for two plants working entirely independently to get much closer together than that.

Q. As a matter of fact, however, did the New Amsterdam Company have the same candle power at its station that the Consolidated did during this period?

A. No, sir, there was a difference between the candle power of the two stations .41 of a candle which I estimate to amount to *t*about .57 of a cent included in that difference of 1.61 cents.

Q. What is the condition of the two companies as to the element of cartage at their manufacturing stations?

6371 A. The New Amsterdam Company are very fortunately situated in that respect. We have to cart refuse away at some expense. People who are filling in land in the vicinity of the New Amsterdam plant are very glad to come and cart theirs away and at the present time they not only have the carting done but receive something for the ashes.

Q. A great deal of filling in in that section is going on, isn't there?

A. Yes, sir.

Q. Now, as a matter of fact the difference in the cartage items of the two companies which would be thus explained is how much?

A. .20 of a cent.

Q. Now, about the item of distribution which goes into the gas at the holder——

A. The very large territory which the Consolidated Company supplies necessitates the employment of distributing stations, the cost of which is *pro rated* between the manufacturing stations.

Q. While the New Amsterdam have but a single manufacturing station?

A. The New Amsterdam have only a single manufacturing station.

Q. What do you find to be the difference in the item of distribution as between the two companies?

A. .26 of one cent.

Q. What about the item of station expense as between the two companies?

A. Well, I am of the opinion that the fact that the station expense at Ravenswood is shared by the distributing department; the distributing department being located at the station results in a division of expense there which would be rather favorable to the cost of that item to the New Amsterdam Company.

Q. It appears that the Consolidated "Station Expense" involved in this amounts to how much more than the New Amsterdam?

A. .32 of one cent per thousand cubic feet made.

6372 Q. Now, if we take into account this difference in candle power which the Consolidated maintains above the New Amsterdam, and the difference in the cartage due to the New Amsterdam station, and the difference in the item of distribution due to the fact that the Consolidated has many stations and the New Amsterdam but one, and this difference in station expense, and aggregate them, they amount to 1.35 cents, do they not?

A. They do.

Q. And if deducted from the previous difference between Consolidated water gas stations and the New Amsterdam station, to wit, 1.61 cents, what would the balance unaccounted for be?

A. .26 of a cent.

Q. Do these figures in your judgment show any want of efficiency in Consolidated water gas management or apparatus as compared with the New Amsterdam?

A. None whatever.

Q. And how about the station cost of the Mutual and Standard which operate in New York City and have their plants here as compared with the station cost to the Consolidated at its water gas stations?

A. The Mutual is higher.

Mr. Kirby: Does the Master consider all this testimony proper rebuttal? It seems to me we are going to length here without limit, taking up all these matters that Mr. Carter has no knowledge of whatever, acting upon sources which are not in evidence.

Mr. Mathewson: You put in evidence the cost between the Consolidated and New Amsterdam and drew the inference that the Consolidated ought to do better. We now put in from exactly reliable sources—you went to the report—we have them—showing the 6373 cost to the Standard and the Mutual operating on Manhattan Island to be the same practically or greater at the holder than the Consolidated. Isn't that proper to meet your bringing in the New Amsterdam?

Mr. KIRBY: In the first place I cannot say it is. In the next place that which we spoke of, we put in evidence, the table is in evidence.

Mr. MATHEWSON: I can have it written out as a table if it makes it better evidence.

Mr. KIRBY: Mr. Carter says he got some information and he draws a deduction from it. Now he is going to the Mutual and now to some other company.

Mr. MATHEWSON: Your Mr. Bemis and Mr. Edgerton and Mr. Marks read reams of deductions from these figures before the Gas Commission in the case of other companies.

Mr. KIRBY: Mr. Edgerton's reams I think consist of one page.

Mr. MATHEWSON: Well, that is a good precedent. I cannot be excluded from the same sources. I am merely asking——

The MASTER: I think if you opened the door for that kind of testimony there seems to be some force in Mr. Mathewson's suggestion. We have all been relying on here, and using, a great deal, these records of other investigations.

Mr. BURR: I concede that we had a great deal of comparative data, but where that data has been extracted from the history of any one company, the circumstances attending anything were fully brought out either on direct examination or cross examination. Now if we have to go into the situation that these two companies were 6374 placed in which would justify the figures that Mr. Mathewson quotes regarding these matters, that is another matter that opens the door to a further examination of these companies.

The MASTER: I am not disposed to exclude it unless carried to what seems to be an unreasonable length.

Mr. MATHEWSON: It is brief. I merely asked what the station cost was of those two companies, the Standard and Mutual, according to the records which he has.

A. The station cost of the Standard for the nominal year ending October 31st, 1905, was 30 cents or .62 of a cent lower than the Consolidated cost.

Q. And it had a single station as against many for the Consolidated?

A. Yes, sir. The Mutual cost was 34.34 of a cent for the same period.

Q. Mr. Edgerton refers to certain foundations at 21st street which he said were not in use and that he did not value, were there any such foundations?

Mr. KIRBY: That they were not there.

A. There are no foundations at 21st street that the company has any knowledge of that are not in use, occupied by apparatus.

Q. And he also took occasion to suggest that he doubted whether the foundations of the apparatus when the new Lowe apparatus was put in were charged off, and that quite likely they still appeared as part of the capital and property account. What is the fact as to that?

A. The fact is that any apparatus that has ever been dismantled in the history of the company to make room for new apparatus has been charged to depreciation account and been taken out of the property account. 6375

Q. And was that true as to anything that was abandoned at 21st street at the time to which Mr. Edgerton had reference?

A. It was absolutely true at that time, as I have established by looking up the entries in the books which were made at that time, and I find that the apparatus that was replaced or superseded at that time was taken out of the plant and property account and charged to depreciation account.

Q. Now, Mr. Edgerton also in explaining why he allowed three per cent. for engineering and general expenses in addition to the amount paid contractors in his estimate of cost of plant stated or explained that he found three per cent. the amount charged for the Astoria plant construction, similar items. Did he not?

Mr. Kirby: No such thing.

A. He so stated specifically in his testimony on page 5387.

Q. Yes, and he said he was surprised to find it so small, I think.

A. Yes, sir.

Q. As a matter of fact, does three per cent. represent the engineering expense at the Astoria plant?

A. It does not. And furthermore, Mr. Edgerton did not have access to any books of account that would have shown to him what the cost of engineering expenses incidental to the construction of the Astoria plant happened to be.

Q. Now, as a matter of fact engineering expenses of that kind are made or passed through the books of the Consolidated?

A. They do, and Mr. Edgerton may have observed some entries in the Consolidated Company's books representing expenditures possibly for salaries or wages which were charged to the Astoria Company, and of course any such item would form but a small part of the expense of that kind of the Astoria Company. 6376

Q. The bulk of such expense would appear in the Astoria books, would it not?

A. Yes, sir, it would.

Q. Let me ask you whether when an expense is made of that character and passes through the Consolidated books that appears as part of the operating cost of the Consolidated Company, or whether it is excluded in your computation?

A. It is excluded, of course.

Q. It does not enter into the cost of Consolidated expenses or property, or account.

—. ——.

Q. As a matter of fact at Astoria has the ten per cent. estimate proven to be not excessive, so far as experience goes?

A. So far as experience goes, the expenditures of that nature at Astoria in connection with the construction of the plant at the present time amount to 11.62 per cent. of the amount expended.

Q. Mr. Edgerton also referred to the natural gas in Chicago, and said that about 168,000,000 feet of natural gas was pumped in daily.

A. 168,000,000 repeated twice on page 4845 of Mr. Edgerton's testimony. The fact is that according to Mr. Bemis' testimony the output in Chicago is about 11,000,000,000 cubic feet per annum, which would, reduced to a maximum day's output, amount to about 55,000,000 feet for a maximum day against the 168,000,000 of natural gas which Mr. Edgerton testified was pumped into Chicago at high pressure.

6377 Q. Did it not appear from Mr. Bemis' testimony that a greater part of that was manufactured in Chicago?

A. Of the 11,000,000,000 feet the greater part of it was manufactured gas.

Q. But if you assumed a maximum day's output and assumed that it was all natural gas, it would not equal the amount which Mr. Edgerton assumed was pumped in daily in the shape of natural gas?

A. It would not amount to one-third of it.

Q. Mr. Edgerton also referred to the correction for temperature, which testimony is on page 4851.

A. He testified that he thought prior to July 1st, 1905, the city inspector corrected for temperature. As a matter of fact, we know that the city inspector did not correct for either temperature or pressure prior to July 1st, 1905.

Q. What have you to say to Mr. Edgerton's statement that the 14th street plant is a dilapidated old plant?

The MASTER: Did you not cover that this morning?

Mr. MATHEWSON: I don't think I did fully.

A. Well, there has been nearly a million dollars expended on keeping that plant in repair since 1884, and as I testified this morning, the plant has been greatly increased and the cost of manufacturing gas there has been greatly reduced, so in every respect the standard of efficiency has been maintained at the plant and the capacity considerably augmented.

Q. Would you agree therefore, with Mr. Marks' statement on page
4587 that the works themselves appear to have been amply repaired
and the operating portion used for the manufacture and
6378 generating of gas rather than with Mr. Edgerton's statement that is was dilapidated?

A. Yes, sir, I should have to agree with Mr. Marks' testimony with respect to that.

Q. Did you read Mr. Edgerton's hypothetical cost of mixed coal and oil gas, in the City of New York?

A. Yes.

Q. And have you prepared a table reviewing that?

A. I have prepared a table wherein I substitute for his figures the actual results obtained in New York City.

Q. What of his figures or methods do you employ in making up the table to which you refer?

A. I have accepted his coal figures as to the production of gas per ton of coal and the cost per ton, and one or two other items. I have also accepted his cost of purifying gas, because he alleges with respect to that item that he gets better results, two candles better.

Q. And so far as the other items are concerned, you have inserted in this table actual facts instead of Mr. Edgerton's fancy?

A. Yes, instead of Mr. Edgerton's hypothetical conditions, yes, sir. That is the table (handing paper).

Q. And this table shows that employing such actual facts in the cases where you have stated, you have done so, the cost per thousand feet of his mixed coal and oil gas in New York City to be how much?

A. 36.22 per thousand feet of mixed oil and coal gas. The table is as follows:

6379 MIXED COAL AND OIL GAS.

MR. EDGERTON'S HYPOTHETICAL COST ADAPTED TO NEW YORK CONDITIONS—ASSUMING COST OF OIL GAS TO BE AS COMPUTED BY MR. EDGERTON.

Cost of coal—10,640 c. f. @ $3.20	30.08	30.08
Cost of discharging—labor and cartage 25.66c. per ton	2.41	1.053
Labor—gas making and purifying 78.95c. per ton	7.42	4.91
Supervision	.50	.50
Repairs	4.26	3.50
Purifying material—Lime	.75	.75
Purifying Material—Oxide	.25	.25
Oil waste and sundries	.37	.37
Water	.17	.17
Expense	.77	.50
Distribution	.88	
Distribution station expense	.55	
	48.41	42.083

Less Residuals:

Coke, 66%	1,478 lbs.	1,478 lbs.		
Less use in retorts, 32%	473 lbs.	295.6		
Coke for sale	1,005 lbs.	1,182.4		
Value at 2.75 pr. short ton	$1.381875—	12.98	22.22	
Tar 13 gals. per ton @ 2.24c	.29.12c.—	2.73	7.049	
Am. 21.22 lbs. sulphate per ton @ 1.36c	28.85c.—	2.71	5.263	34.532
		18.42		

Less cartage and labor handling coke at 53.69c. per ton coke...........................	2.69	15.73	
		32.68	7.551

775 c. f. @ 32.68—25.32
225 c. f. @ 48.45—10.90

1000 c. f. —36.22 Cost per M. c. f. of Mixed Gas.

NOTE.—Mr. Edgerton's figures underlined.

6380 Q. Now, Mr. Carter, as to the receipts from residuals, Mr. Doane has testified in reference to the sale of coke, and also Mr. Addicks. Have you conferred with Mr. Doane or the other officers in respect to the market for coke from time to time?

A. It is frequently a subject of conversation.

Q. And is that subject of the sale of coke pushed by the Consolidated Gas Company as well as the National Coal & Coke Company?

A. Decide-ly in every way, by advertising and by the exhibiting of signs and announcement to consumers through such facilities as we have, everything that we can do to encourage the use of coke as fuel is done.

Q. Now, in reference to your ammoniacal liquors and your coal tar respecting which you are dealing with the Barrett Manufacturing Company. It has been suggested that the company might itself deal with those products. Has that subject ever received consideration from you or the Consolidated Company?

A. Yes, sir, I have given personally some consideration to the subject of the conversion of coal tar into pitch and dead oil and the marketing of those products, and considering the amount necessary to be invested in a plant for performance of that work, the expense of doing it, the expense of marketing the commodity, the possibility of competition, I have not seen my way clear to recommend that the company take up the handling of that product itself.

Q. Was this investigation and this thought to which you have referred given to the subject in order to determine whether it was possible or prudent for the company to undertake this work and establish a plant for the purpose?

A. It was for that purpose.

Q. Was it during the pendency of this hearing or before it?

A. Oh, before this hearing.

6381 Q. Now, as a matter of fact Field's analysis from which Mr. Kirby quoted at pages 6049 and 6050 of this record, shows, does it not, 1.37 pence equal to about 2.74 cents per gallon for coal tar received by the three London companies?

A. Yes, sir.

Q. Now, this being per Imperial gallon, which is 20 per cent. larger than the American gallon, what price would that mean if reduced to terms of the American gallon?

A. 2.19 cents per American gallon.

Q. And what did the Consolidated Company receive in 1905 for its coal tar?

A. 2.24 cents per gallon.

Q. Now, Mr. Kirby, also at page 6049 of the testimony, referred to a report in Field's Analysis that the three London companies received for their ammoniacal liquor and sulphate of ammonia 48 cents per ton of coal carbonized. Do you understand that this was 48 cents per ton of coal carbonized net to those companies?

A. No, sir, I do not. I understand it was gross, and that there could be no comparison made between those receipts and the receipts of the Consolidated Company for its ammoniacal liquor.

Q. In other words, out of that 48 cents if these companies treat it themselves, would have to be deducted the expense of treating it, and the return on the plant invested in treating it, would it not?

A. The largest company of the three and the one that does a larger business than the other two combined, sold no ammoniacal liquor, but only sulphate of ammonia during the year 1905.

Q. What do you find was given as the market price for sulphate of ammonia?

A. I found in the same London Gas Lighting journal in which
I got the report of the Gas Light and Coke Company of
6382 London a statement of the market price per ton of sulphate
of ammonia, which reduced down to pounds, figured about
2.73 cents per pound of sulphate. The price which the Consolidated Company received for its ammoniacal liquor is based upon an average market price here of 2.75 cents per pound of sulphate of ammonia.

Q. Slightly more than the London Company?

A. Slightly more than the average price prevailing at that time in London.

Q. Practically the same?

A. Practically the same.

Q. You have read the testimony here on the subject, have you not, of the ammonia and coal tar?

A. Yes, sir.

Q. And with that in view and as the result of your examination, do you think it would be wise or profitable for the Consolidated Gas Company to enter into the treatment of those two products and establish a plant for that purpose?

A. I don't think it would be wise, no, sir.

Q. And in your judgment would the net results be any better to the company than they are getting now, so far as those products are concerned?

A. It is because I think it would be no better that I think it would not be wise, Mr. Mathewson.

Q. Referring to the tabulation of Mr. Edgerton in his hypothetical cost of mixing coal and oil gas in New York City, what do you find as to the value of his residuals in relation to the cost of his coal according to the estimate which he prepared?

A. Well, I find that while it is not apparent on the face of it, the value of his residuals exceeds the cost of his coal.

Q. By how much, do you remember?

A. Well, six or seven cents, I think, as near as I can remember.

6383 Q. And in making up this schedule, you assume for the purposes of this computation, do you not, his coal figures as to the cost of production and the cost of two or three other items including his purification figures?

A. Yes.

Q. On page 5362 Mr. Edgerton states that he saw a lot of foundations at 21st Street station on which there was no apparatus. Are there any such foundations there that you know anything about?

A. There are no such foundations in existence.

Q. Now, Mr. Carter, leaving Mr. Edgerton's testimony and taking up a few other points, have you read the analysis of Marwick, Mitchell & Company relating to the cost of the property of constituent companies as carried on their books prior to consolidation, and the testimony of Professor Bemis and others to the same point, they starting with the statement that the cost to the six constituent companies of the property taken over by the Consolidated Gas Company in 1884, appeared in the books of the six companies at only $20,942,000?

A. Yes, sir, that sum has been referred to repeatedly.

Q. Is it a fact that all the property of the Consolidated Gas Company which it took over, and which was included in the $29,994,000 appraisal of Rowland and so forth in 1884, did appear on the books of the company as only $20,942,000?

A. No, sir, it did not so appear.

Q. Now, as a matter of fact at page 776 of Senate Document 47 of 1886, Mr. Yalden has a column headed "Costs of property," and in the exhibit that has been presented here from Mr. Hall in the Marwick, Mitchell & Company report, he also uses the term "Cost;" is there any such heading in the books of the constituent
6384 companies as cost?

A. None in any of them, no, sir.

Q. Is there any account in the constituent companies that states that figures, $20,942,000 as the cost of the properties?

A. Not a line.

Q. As a matter of fact, those figures $20,942,000 relate to the books of how many of the six companies?

A. They relate to the books of five of the six companies.

Q. And the Knickerbocker books were not before the Committee of 1886, were they?

A. They were not, no, sir.

Q. Does the $20,942,000 represent anything less than the figure at which certain property of the five companies who were present was carried on their books at that time?

A. That is all it represents.

Q. After charging down depreciation and other accounts?

A. After charging down depreciation in very large sums.

Q. I would like to have you say whether you have examined as Professor Bemis said he had examined the report, Senate Document 47 of 1886, and whether you will show from that that the $20,942,-

000 was not the cost of the property which the Consolidated Gas Company took over at $29,994,000 in 1884? In the first place the $20,942,000 did not include any property of the Knickerbocker Company, did it, except $810,000 expended by the Municipal Company on the plant of the Knickerbocker Company after the Municipal Company leased the Knickerbocker Company properties?

A. That is the case.

Q. And does Mr. Yalden so state in his testimony before the Committee of 1886?

A. He plainly states that, repeatedly states it.

Q. Will you make your statements and deductions referring to such points as you think advisable? 6385

A. The statement is intended to show the amount by which the value of the books of the old companies of the plants transferred to the Consolidated Gas Company exceeded the value at which it was appraised in 1884. In the first place, I would have to establish the value of the plant of the Knickerbocker Gas Light Company. The testimony before the Senate Investigating Committee of 1886 in Senate Document 47 was to the effect that there had been expended on the property of the Union Gas Light Company prior to the time of its going into the hands of a receiver and being acquired by the Knickerbocker Company, $1,200,000. That this company was acquired by the——

Q. That is by the testimony of whom?

A. This appears by the testimony of John Sickles who testified on page 284 of Senate Document 47. The Knickerbocker Gaslight Company invested after acquiring its property some $1,200,000 on it.

By Mr. Burr:

Q. Are you testifying of your own knowledge?

A. I am testifying as to the results of the testimony given before the Senate Committee in 1886.

Q. That is true with regard to all the statements you are making about the company?

A. Yes, sir.

The Master: I so understand.

The Witness: It was testified that cash was raised, dollar for dollar, for $750,000 of Knickerbocker bonds, and $450,000 of Knickerbocker notes on page 279 of the testimony. And a detail was given there of the expenditure of $1,100,000 out of the $1,200,000.

6386 By Mr. Mathewson:

Q. Represented by those bonds and notes?

A. Yes, sir, or the cash realized from them. This appears on page 283 of Senate Document 47. It appears furthermore that $810,000 was expended by the Municipal Company for the benefit of the Municipal Company, such expenditure being shown on the books of the Knickerbocker Company, and included by Yalden in his total valuation of $20,942,000. The property was appraised in 1884——

Q. Had you not better give the summary?

A. The summary with respect to the Knickerbocker Company in brief is this, that there was invested by the Union Gas Light Company prior to the receivership $1,200,000. There was invested by the Knickerbocker Gas Light Company prior to the acquiring of that company by the Municipal Company $1,200,000, and there was expended by the Municipal Gas Light Company $910,000, a total expenditure of $3,210,000, and this by the way does not include any expenditures of surplus, which the books indicate that the Knickerbocker Gas Light Company had accumulated up to 1884. The statement of Yalden indicates that they had $416,000 of surplus earnings undistributed, and of course the inference is that that was invested in plant and property, but I have only taken into account in this table the expenditures by the Union Gas Light Company by the Knickerbocker Company and the Municipal Company aggregating $3,210,000.

Q. And were all these sworn to by uncontradicted evidence before the Committee of 1886?

A. The testimony of witnesses in that respect was not contradicted in any respect whatever.

6387 By Mr. **Burr**:

Q. What other witnesses do you refer to beside Sickels?

A. A number of witnesses testified to that effect.

Mr. **Mathewson**: Yalden testified to the $810,000 expended by the Municipal Company.

Mr. **Burr**: Have you given all the pages where this appears, pages 279, 284 and 283?

Mr. **Mathewson**: And page 278 and 282.

By Mr. **Mathewson**:

Q. This property was appraised at what figure in 1884 at the time the Consolidated took it over?

A. At the time the property was transferred to the Consolidated Company in 1884 it was appraised at $2,472,000. In other words, the undisputed testimony with respect to the cost indicates that the property cost $738,000 more than it was appraised at in 1884.

Q. Now, of this $3,210,000 or the appraised value of $2,472,000, how much appeared in the $20,942,000?

A. Only $810,000, the amount which the Municipal Company had expended on the property.

Q. Have you prepared a table showing——

A. I think I can state what it is. Showing that the appraised value of the plant transferred to the Consolidated Gas Company was $204,134.05 less than the book value.

Q. Do you mean by that the cost of the plant, according to the books?

A. No, the cost of the plant is another proposition entirely. I am showing now the difference between the appraised value and book value of the plant, showing that so far as the plants
6388 were concerned that they were appraised at less than the book value, less than the value at which they were carried on the books of the old companies.

Q. Regardless of the fact that they were carried on the books of the old companies at very much less than their cost?

A. Yes. I have prepared a table showing that, and submit it herewith.

Appraised value of plant and property in 1884, (excluding franchises and rights $7,781,000)..				$29,994,000
Value as shown by books of Constituent Companies—(Yalden's summary p. 1398 Exhibit in this case)..................				20,942,632.85
Excess appraised value over book value				$9,051,367.15
The Real Estate of the old companies, including that of the Knickerbocker Co., was taken over by Con. Co. (see Ex. 79: p. 347 A Exhibit) at...........			$10,332,000	
Messrs. Marwick and Mitchell (p. 1562 Exhibit) reported that the real estate was carried on the books of the old companies (excluding Knickerbocker)			3,377,971.10	
Difference (which includes Knickerbocker Real Estate appraised @ $595,000 M. & M. p. 1570 Exhibits)			$6,954,028.90	
6389 On page 875 of Exhibits in present case appears a statement in Comp. Ex. 227 which shows the excess of appraised value of mains, meters and services in 1884 over value shown on books of old companies to have been................			$1,979,315.00	
The plant and property of the Knickerbocker Company was appraised in 1884 (p. 652, Senate Document 47).		$2,472,000		
Including mains, meters and servies	$894,000			
Real Estate	595,000	1,489,000		
Balance representing Plant		$983,000		

Investmt. by Mun. Co. in plant for Knickerbocker Co. included in the $20,942,632.85 (S. D. 47, page 948). $660,842.70		
Bal. being appraised value Knick. plant over amount invested by Munic. Co. for a/c Knickerbocker Company............	322,157.30	$9,255,501.20
Difference—being the amount by which the value on the books of the old companies of the plant transferred to Con. Co. exceeded the value at which it was appraised in 1884		$204,134.05

6390 Q. Well, this statement which you have just submitted states in brief that deducting from the appraised property in 1884, $29,994,000 the book value of assets as shown on the books of the five companies outside of the Knickerbocker, $20,942,632.85 you have $9,051,367.15, appraised value over that particular property?

A. Yes, sir.

Q. But the appraised value covers property, does it not, which is not in the $20,942,632.85 at all?

A. That is the case.

Q. What are these items the sum of which you compare with the difference of $9,051,367.15?

A. The first item is the excess of the appraised value of the real estate in 1884 that was transferred to the Consolidated Company over the value at which Messrs. Marwick and Mitchell report that it was carried on the books of the old companies, excluding the books of the Knickerbocker Company. In other words from the appraised value of $10,332,000 I deduct Marwick, Mitchell & Company's value as shown by the books of the old companies of $3,377,971.10 and I get a difference which includes the Knickerbocker real estate appraised at $595,000 of $6,954,028.90. On page 875 of exhibits in the present case appears a statement in Complainant's Exhibit 227 which shows the excess of appraised value of mains, meters and services, in 1884 over value shown on books of old companies to have been $1,979,315. These are two items of appreciation which have nothing to do with the plant, appreciation in real estate and appreciation in mains. There is one other item of $322,157.30 which is the plant of the Knickerbocker Company over and above what was shown on the books of the Municipal Company as having been expended, and which are therefore included in the appreciation shown
6391 by comparing the $29,994,000 and the $20,942,000. These three items being, first, the appreciation in the real estate;

second, the appreciation in the mains, and, third, an item excluded because it was not shown at all upon the books of the old company, that is a certain portion of the plant of the Knickerbocker Company, amounting in the aggregate to $9,255,501.20. Deducting from this the amount ppreviously given, $9,051,657.15, leaves a balance of $204,134.05 which is the amount by which the value of the books of the old companies of the plant transferred to the Consolidated Gas Company exceeded the value at which it was appraised in 1884.

Q. I think I understand you, Mr. Carter, but put from a layman's standpoint it amounts to this, does it not, that deducting the appreciation of real estate, deducting also the amount carried in mains, services, etc., that you have left an amount for value applied which exceeded the appraised value of plant in 1884?

A. That is the case.

Q. So that without regard to the proposition that the plants were not carried at their actual cost on the books of the constituent companies, the figures at which they were carried exceeded the amount of the appraised value?

A. That is the case, yes, sir.

Q. Now you have referred to the fact that the Knickerbocker Company did not appear at all in this $20,942,000, except $810,000 which was spent on the Knickerbocker plant by the Municipal Company, and that, therefore, the difference between the $810,000 and the $3,210,000 that was spent on the Knickerbocker plant or $2,400,000 of cost in relation to the Knickerbocker Company alone did not appear in the $20,942,000, is that right?

A. That is absolutely the case, yes, sir.

6392 Q. Now, will you point out some other items which did not appear in the $20,942,000, but which represented actual cost of property to the constituent companies at that time?

A. Yalden indicated by his reports and in his testimony that the practice of the old companies was to conceal earnings by writing down the book value of their properties, employing their surplus earnings for that purpose, and in the case of the New York, and Manhattan and Municipal Companies he indicated so plainly sums which had been written off the book value of their property, that it is only reasonable that in endeavoring to arrive at the cost of those properties, that the amount thus written off should be added to what was shown to have been the cost at that time.

Q. Do you refer to amounts which were arbitrarily written off and did not represent actual expenditures for repairs and renewals?

A. I referred to amounts arbitrarily written off over and above anything expended for repairs and renewals.

Q. What figure did he find the companies had written off, say the Manhattan or New York Company?

A. In the case of the New York company on page—I do not happen to have the page at the moment——

Mr. Burr: Yalden's report you are referring to?

The Witness: Yalden's testimony in Senate Document 47, he indicated that $2,929,357.97 of surplus appearing in the accounts of the New York Gas Light Company represented profits which had

been written off their property account and which in writing back again, or writing the amounts back again, only restored the
6393 property to its original cost. He distinctly testified to that effect.

At page 434 Mr. Yalden testified respecting the amount which the New York Company had written off. He says finally this was written back by appreciation to the Consolidated Company and the balance shown on the profit and loss resumé on page 707, amounting to $3,646,258.19 is in fact surplus profit of the company beyond the stock capital account. That is Yalden's statement, and of that $3,646,258.19, the account I have already named, $2,929,357.97, was added to the book value of their property at that time, therefore an amount properly to be added to their book value as shown by Yalden, which did not include this amount written back at consolidation, but which excluded it, this amount I say should be added to the $20,942,000 to get even approximately the cost of the property together with others which I will name.

Q. That amount is how much in the case of the New York Gas Light Company?

A. $2,929,357.97.

Q. Which should be written back?

A. Which should be written back.

Q. That is a portion of the amount which should be written back that was arbitrarily written off?

A. Yes, sir.

Q. In the case of the Manhattan Company?

A. Mr. Yalden testified that $2,030,000 had been written off during the period of ten years ending in 1884. That was on page 329.

Q. $2,030,000 had been written off in ten years against a plant costing on the books, how much?

A. $2,400,000.

Q. Pretty nearly the whole value of the plant?

A. Pretty nearly the whole value of the plant, and he also
6394 established the fact that it was the practice not only to write off these amounts, but to maintain the property by charging the cost of such maintenance and wear and tear to the repair account.

Q. Did he testify that as much as eight or ten per cent. annually of the value of the property had been so arbitrarily charged up?

A. He undertook to establish that 12½% was the amount charged off, and the proper amount, confirming his statement by referring to this particular transaction of the Manhattan Company.

Q. Do you recall Professor Bemis' testimony that even if as much as 2 per cent. or anything beyond 2 per cent. was charged up to depreciation per annum it would indicate that the company was adding lavishly to its construction account without having it appear in the construction account?

A. Professor Bemis testified substantially to that effect, as did also Professor Marks.

Q. Does this appear to be a case of that kind?

A. I should say it was decidedly a case of that kind.

Q. The Manhattan Company real estate at the time of consolidation was carried on its books at actually less than the cost, according to its own record, was it not?

A. Yes, to the amount of $21,706.

Q. Although that real estate had been acquired as early as the 50's, had it not?

A. As early as the 30's.

Q. Part in the 30's and part in the 50's?

A. Yes.

Q. What about the writing off for the mains, meters and services for the ten years from 1871 to 1881 on the part of the Manhattan Company?

A. Their accounts as brought down in his tables by Yalden, indicate that $768,000 was written off from the mains, meters and services alone during the ten years from 1871 to 1881. 6395

Q. Well, now, in order to see if this was justified or not, does not Mr. Yalden testify that these plants of the Manhattan Company off which over $2,000,000 was charged in ten years, and against the original cost of $2,400,000, were at the time of consolidation practically as good as new?

A. He testified specifically to that fact, that they were as good as new, and there were other witnesses who testified to the same effect at the same hearing.

Q. And at the time of consolidation is it not a fact that amounts which had been arbitrarily charged off in this manner were charged back on the books of the company, the Consolidated Company, in some instances?

A. Yes.

Q. So as to restore construction account to the proper figure?

A. Yes.

Q. Take the Harlem Company, what do you find as to the filling in of the water front property of that company, was that charged to construction account, as it should have been?

A. Mr. Moss, the vice-president of that company, testified that the filling in of the water front property and the filling of bulkheads and expenditures for mains and construction of other kinds were paid out of earnings.

Q. And that they were not charged to construction or added to property account at all?

A. That is the case.

Mr. Burr: What is the page?

The Witness: 234, 325, 335 and 331. On page 331 he testified that the capacity of the plants had been brought from one million to two million feet, the greater part being charged expense account. 6396

Q. In other words, the capacity of the Harlem plant was doubled with practically no charge whatever to property account, or addition to property on that account?

A. That is the case according to the testimony, yes, sir.

Q. Now, does any of this additional plant or property that resulted from the use of the New York Gas Light Company surplus, or from the addition to property or writing down of property by the Manhattan Company to which you have testified, or the additional property which accrued to the Harlem Company and was charged to expense account, when they doubled the capacity of their plant, appear at all in the $20,942,000?

A. Not a dollar of it.

Q. Now, have you prepared a table here showing the appraised value of the plant and property transferred to the Consolidated Gas Company in 1884, $29,994,000, and deducted from that the appreciation in the value of land only, from the figures as they appear on the books of the constituent companies, as compared with the figures at which the land was appraised in 1884?

A. Yes.

Q. And that shows a balance of $23,039,971.10 after deducting the appreciation in the value of land only?

A. Yes, sir.

Q. So that the property of the Consolidated Company appraised at $29,994,000 in 1884, if you deduct the appreciation of land over cost, leaves a balance of only $23,039,971.10 as against the figures carried on the books of five of the companies at $20,942,632.85?

A. That is the case.

Q. Now, to this $20,942,632.85 in this table have you added the additional expenditures and costs for the properties of the Knickerbocker Company, the New York Gas Light Company, the 6397 Manhattan Gaslight Company and the Municipal Company which you have been able to identify as you have stated?

A. I have added those amounts, yes, sir, reaching a total of $29,106,098.56 and to that total, of course, would have to be added, if we knew the amount, whatever was expended by the Harlem Company for doubling the capacity of their plant, which they charged to expense account, and in filling in their water front and constructing bulkheads and charged to expense account, and other similar expenditures not shown in their construction account, and construction by all of the other companies that may have been charged to their repair accounts, and therefore, not included in Yalden's statement, if known would have to be added to this total.

Q. This total, taking the figures of the books of the original five companies, $20,942,682.85 and adding these various items which you have amounts altogether to $29,106,098.56, and that includes no appreciation of real estate, does it?

A. Not a dollar.

Q. And it does not include the cost of doubling the capacity of the Harlem plant without any cost to property?

A. No.

Q. And pretty nearly reaches the $29,944,000 at which all the property was appraised in 1884, does it not?

A. It does.

Q. From your investigations are you prepared to say that the $29,994,000 including the appreciation of real estate represents more than the actual cost to the companies originally of their plant, property and real estate?

Mr. Burr: Objected to as incompetent and immaterial.

6398 The Master: Well, I suppose it is a matter of argument.

Mr. Mathewson: The witness has made a very careful examination of the record, as you can see, and other witnesses have drawn their conclusions, and I think he should be allowed to state it.

The Master: He may state it.

Mr. Burr: Exception.

A. The result of my examination of the testimony taken before the Senate Committee in 1886, is that the $29,994,000 is considerably less than the cost of the property of the old companies.

Q. Now, Mr. Carter in testing the valuations of the appraisals of $29,994,000 in 1884, did you examine the figures of the Equitable and Mutual companies which appeared in Senate Document 47 of 1886, and which were not questioned by Mr. Yalden?

A. I did and made some calculations to determine the amount of the investment of those companies per million feet of capacity as testified to by them, and compared the result with the valuation per million of capacity placed upon the property of the Consolidated Company.

Q. Is this table which you now produce such a compromise?

A. Well, the table that you have deals with the Mutual Company only and shows in substance that dealing only with such assets of that company as correspond with the property included in the $29,994,000 of Consolidated Company valuation, the actual investment would amount to $6,056,432.17, which would be $1,514,100 per million cubic feet capacity, at which rate the 28,000,000 feet of capacity of the Consolidated Company would have amounted to $42,394,800 instead of the $29,994,000. In the accounts of the
6399 Equitable Company the figures differed somewhat, although
the total value of the Equitable Gas Light Company property per million feet of capacity was $1,148,900 against $1,067,900 per million feet of capacity of the Consolidated plant and property.

Q. And that also exceeded the value per million of capacity, didn't it?

A. Yes, sir, and of course in making that comparison it would be unfavorable to the Consolidated Company for the reason that the Consolidated had of its entire plant fifty per cent. coal gas plant, whereas both the Equitable and Mutual Companies had water gas plants, which are admittedly less expensive to construct than a coal gas plant.

Q. And did you find that Mr. Yalden criticized the value of the property of the Equitable and Mutual companies unfavorably?

A. Not a word of criticism unfavorable to either of the companies. And because the Equitable Company had been operating but a short time, and their property had been purchased, both land, plant, mains and services within a comparatively short time of the date of this investigation, therefore, their values would probably more closely reflect conditions at that time and costs at that time, than any other companies.

Q. Now, you find that the mains of the Consolidated Company were appraised in 1884 at a cost of pipe of somewhat in the neighborhood of thirty dollars per ton, was it?

A. Yes, sir.

Q. Did you find that in that appraisal of 1884 account was taken of the fact that pipe during the time that a large amount of the mains of the constituent companies were laid, was costing as high as fifty dollars, sixty dollars, seventy dollars, or even eighty dollars a ton, as defendant's witnesses have admitted?

6400 A. No evidence of that sort whatever. On the other hand, I did make a comparison with the cost of mains of the Equitable Company, which demonstrated that the appraised value of the mains of the Consolidated Company in 1884 agreed almost exactly with the cost values of the Equitable Company mains laid at about that time, within two or three years of the investigation of 1886.

Q. As to the appraisal at that time, do you find anything, any testimony, as to whether the appraisal covers the operating plants, or as to whether useless things were appraised?

A. The testimony was very distinct that no useless or abandoned property or plant was valued in the appraised.

Q. Now the defendant's witnesses testified as to certain observations of Mr. Kennedy, who was president of the Mutual Company, which did not go into this consolidation and still exists. What do you find that Mr. Kennedy states at page 413, as to the value of the Manhattan plants as they appear in the appraisal of $29,994,000?

A. Mr. Kennedy testified on page 412 of Senate Document 47 that nothing useless was appraised; and on page 413 that the schedule of the Manhattan plant be considered a very fair appraisal of the value of the plant; and again on page 414, he stated that in his opinion the appraisement of the property of the constituent companies was a fair one. On page—it is not given here, but I can find it—he testified that the plants of the Manhattan Company that comprised the 14th and 18th streets plants were as fine as any of the kind in existence.

Q. This was the same Mr. Kennedy whose testimony was quoted by the defendants, was it not, who testified that these appraisements in 1884 were fair ones of the plants of the constituent companies?

A. Yes, sir.

6401 Q. Do you remember what General Roome, the chief engineer of the Consolidated Gas Company, testified would be required to convert the capacity of the Consolidated Gas Company into thirty-two million or thirty-three million feet per day?

A. He testified that having all the land and buildings and most of the apparatus necessary for increasing the capacity of the plant that he could add five million feet capacity at an outlay of about a million dollars at that time, raising it from 28,000,000 to 33,000,000 feet per day.

Mr. Burr: What is the page?

The Witness: Page 522.

Q. Now, referring back for a moment to the Manhattan Gas Light Company, Mr. Yalden's summary at pages 683-684, in which he testified that there was written off for meters and services the sum of $768,517.96, within ten years, how much do you find during that period there was added to the account for mains?

A. In certain years nothing whatever.

Q. Yes, but for other periods?

A. No figures appearing. The addition during that period amounted to but $147,630.70.

Q. So that in spite of the growth of the Manhattan Gas Light Company, and it being a prosperous company at that period, the mains' account, book value of the property, was diminished by over six hundred thousand dollars, was it not, during that period?

A. It was, yes, sir.

Q. Instead of being added to and showing a larger property account than at the beginning?

A. As it logically would have done if the books had shown the actual value of their property.

6402 At 5:20 P. M. adjourned to Tuesday, January 29, 1907, at 11:00 A. M.

6403 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,

vs.

JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *January 29th*, 1907.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

6404 MR. MATHEWSON: The statement or schedule prepared by Mr. Carter and which he produced at page 6396 of the minutes was omitted in some manner in the minutes, and I would like to have it spread in now. It is as follows:

Appraised value of plant and property transferred to Consolidated Company in 1884		$29,994,000.00
Less appreciation in value of land—appraised value in 1884 over book value		6,954,028.90
Balance		23,039,971.10
Figures at which certain plant and property transferred to Consolidated Company in 1884 was carried on the books of the constituent companies (excluding those of the Knickerbocker Company) as per Yalden		20,942,632.85
Knickerbocker Co., cost	$3,210,000.00	
On books Municipal Co	810,000.00	2,400,000.00
N. Y. Gas Light Co., amount property was written down below cost and written back at time of consolidation, as per Yalden's statement		2,929,357.97
Manhattan Gas Light Co., amount written off although plant was as good as new at consolidation, as Yalden states		2,030,000.00
Municipal Company, amount written off but written back at consolidation		804,107.74
Total		$29,106,098.56

6405 To which should be added most of the cost of doubling the capacity of Harlem Plant which was charged to Expense Account; also cost of filling in waterfront and constructing bulkheads, etc., charged to Expense Account; and other similar expenditure not shown in the Construction Account of that Company, amount unknown.

Such construction by all the above companies as was charged to repairs and therefore was not indicated in Yalden's summaries—if known—would have to be added to the above total.

Robert A. Carter resumed.

By Mr. Mathewson:

Q. Mr. Carter, on the subject of arbitrary charging down of the property of various constituent companies so as to produce the sum of $20,942,000, excluding the Knickerbocker, will you quote Mr. Yalden's testimony at page 438 of Senate Document 47?

A. Mr. Yalden said at that point:

"The methods they used in keeping their accounts previously by writing to the debit of profit and loss to the credit of appreciation account, and so lessening the actual cost of their property amounting to such a sum that enabled them to write it back again and reinstate the property at something like what it cost."

Q. The writing back again to which Mr. Yalden refers was the raising of the value of the property above the $20,942,000 at the time of consolidation, was it not?

A. It was to that he had reference.

Q. Now, what does Mr. Yalden say at page 440?

A. Mr. Yalden says: "Furthermore this depreciation account, although it was called such was really an account for no other purpose practically than to hide away some of the profits until the opportunity came for them to increase the capital stock from it, there was a great deal more put into it than was necessary." 6406

Q. And what is the language of Mr. Yalden on page 434 of the Report of 1886?

A. "The company——"

Q. Which company was he referring to?

A. The New York Gas Light Company. "The Company was, many years ago (similarly to the Manhattan Co.) in the habit of transferring from their profit and loss account sundry items to provide for depreciation and wear and tear of property, which in the aggregate amounted to a very considerable sum.

Finally this was written back by appreciation to the Consolidated Company and the balance shown on the profit and loss resume on page 707 amounting to $3,646,258.19 is in fact the surplus profit of the company beyond the stock capital account.

Q. And at page 361 what does Mr. Yalden testify respecting the Manhattan Company?

A. As follows: "In the early part of 1857, and continuing until October, 1863, the company was in the habit of transferring, at certain periods, an amount from profit and loss to the credit of depreciation account, creating a reserve fund to meet the wear and tear of the various properties and works, and during these years the amounts so charged to profit and loss amounted to nearly $1,000,000.

It seems, however, that the company having also provided for alterations and imprpovements by charging such expenses to the profit and loss account, subsequently by resolution of the board of directors in November, 1863, they transferred $756,288.51 to the profit and loss account." 6407

Q. Would, then, Mr. Marks' statement that when companies are prosperous they are likely to charge down lavishly appear to have been followed in this case?

A. It would appear to have been followed.

Q. Now, were these companies prosperous during that period?

Mr. **Burr**: Objected to.

Q. I do not mean to have you go into details, but merely to state generally, as evidenced by the earnings and disbursements according to reports, in the nature of dividends.

Mr. **Kirby**: I also object to this. Prosperous is a wide term.

Mr. **Burr**: I would like to have you define what you mean by prosperous.

Mr. **Mathewson**: I know when I am prosperous, when I have money in the bank.

Mr. **Burr**: We claim that the Consolidated Gas Company is extremely prosperous to-day, and you claim that——

Mr. **Mathewson**: I will accept the witness' construction of what Mr. Marks may have meant in his statement that companies charge down lavishly when prosperous. I will take the answer, anyway.

A. The statement of the company as shown in Yalden's report indicates that they were extremely prosperous.

Q. And paying large dividends?

A. Paying very large dividends indeed; as high as fifty, 6408 and sixty, and seventy per cent. per annum, and higher even.

Q. And gas from 1825 to 1880 ran from ten dollars a thousand to three dollars, something like that?

A. Yes, sir.

Q. Can you state Mr. Rowland's qualifications as given by him in this testimony of 1886?

A. Yes, sir.

Mr. **Burr**: I object to that as being incompetent, irrelevant and immaterial, the witness not being shown to be qualified to testify to Mr. Rowland's qualifications.

Mr. **Mathewson**: He is simply quoting from the same report which you have quoted from.

Mr. **Burr**: You are asking him to read what Mr. Yalden said with regard to Mr. Rowland?

Mr. **Mathewson**: No, I am asking him to read a statement from that very book as to Rowland's qualifications, that is all, which you have quoted from through your own witnesses.

Mr. **Burr**: From which part of the book, from the report of the Committee?

Mr. **Mathewson**: No, you did not confine yourselves to the report of the Committee.

Mr. **Burr**: We certainly will not after this, I can assure you, but I would like to know what particular part of the book you are referring to, and whose testimony it is.

Q. Just answer the question.

A. Mr. Rowland stated with respect to his qualifications:

"I built the Municipal Gas Light Company's works at the 6409 foot of 44th street and also the Knickerbocker works at 99th street and Second avenue; I rebuilt the New York Gas Works almost entirely; I built the Nassau Company's works of Brooklyn, Long Island; I built a large gas works for the Boston Gas Light Company; I have built a number of small gas works at different parts of the State; I can hardly enumerate them, I don't remember them."

Mr. **Burr**: That is Mr. Rowland's own testimony as to his qualifications, and it appears in Senate Document 47.

Mr. **Mathewson**: Yes, and that is all

Q. Now, you referred yesterday to the fact that the buildings as appraised by Mr. Mayer included foundations of apparatus in every case, and as appraised by Mr. Rowland in 1884, a great part of them did not include apparatus, and that therefore there could be no comparison. Is it not a fact that the capacity of the Consolidated Gas Company has substantially doubled since 1884 so far as output is concerned?

A. Yes, sir, it has.

Q. And is it not the fact therefore that there are great amounts of foundations for apparatus in existence now which were not in existence in 1884?

A. That is unquestionably the case, yes, sir.

Q. And do you understand that those were included by Mr. Mayer in his value of buildings also?

A. They are.

Q. From your knowledge of the buildings and the changes of the apparatus and the changes in foundations of apparatus as between 1884 and date, is it possible, in your judgment, to make an intelligent comparison by taking Mr. Rowland's valuation 6410 of buildings and comparing it with Mr. Mayer's valuation of buildings and apparatus as they now exist?

A. No such comparison is possible.

Q. Now Professor Bemis has endeavored to account for something by suggesting that the plants of the Consolidated or some of them have been changed from coal gas to water gas plants since 1884. Is that so?

A. No, sir.

Q. Your attention has been called by the defendants in various exhibits to the fact that in tax reports or petitions for revision of franchise assessments, the value of the property covered by such franchise assessments was stated to be something like $4,200,000 or in that neighborhood, repeatedly. What is the explanation of that, Mr. Carter?

Mr. **Kirby**: Objected to as not proper rebuttal.

The **Master**: My recollection was that you went into that on the direct-examination of Mr. Carter before, very fully.

Mr. **Mathewson**: No, these tax reports or petitions for revision were put in evidence by the defendants in their own case and they called attention to the fact that in those there appeared statements that the value of the franchises and so on should not be assessed at more than about $4,200,000, and they also referred to evidence of Mr. H. E. Gawtrey in that regard. Now I am merely asking this witness what the explanation of that figure is.

Mr. **Burr**: You asked him at the time very fully.

Mr. **Mathewson**: No, they were not in at that time and I could not have asked him. They were put in as part of your case.

6411 Mr. **Burr**: When I called Mr. Carter as a witness for the defense, I asked him as to some papers I showed him, and you then asked him very fully as to how he made the figures, and he said he consulted with counsel and named the counsel, and I asked him to produce the data and memoranda on which he made up the figures, but I have not seen them.

Mr. **Mathewson**: Well, I only have about five minutes on this line, but I think I am entitled in my case to rebut those inferences which you sought to draw from the testimony you introduced.

The **Master**: Well, in view of counsel's statement that it is very short, it will be quicker to take it than to look it up, to see whether or not it is strictly rebuttal, although I am inclined to think you are right about it.

Mr. Burr: Exception.

A. The amount stated in the special franchise report to the State Board of Tax Commissioners to have been the value for purposes of taxation for tangible property in the street was originally furnished to me by Mr. Simpson and——

Q. Well, the figures are the ones which were furnished by Mr. Simpson on his basis of material and labor in soft earth?

A. That is the case.

Q. And simply the tangible property, is not that right?

A. That is absolutely the case.

Mr. Burr: I object to these questions as being leading.

Mr. Mathewson: I think they are leading, but I am getting at it a little more briefly than perhaps the witness was going to. He understands the situation even better than I do. 6412

Q. And why was not the value of the intangible right included in your valuation for purposes of taxation?

A. Because the allegation in our applications for *certiorari* and for a reduction of the assessments stated that the law under which the right to use the street was taxed was unconstitutional, and that therefore there could be no taxable value of such rights, however valuable they might be as an asset of an operating company, being in the same class of intangible assets as goodwill, which the courts held not to be taxable, although very valuable in itself.

Mr. Burr: Are you reading from a brief or what?

The Witness: Nothing but from a memorandum of my own making, Mr. Burr.

Q. And does that apply to every case in which these figures, or substantially these figures, appear in your petitions for revisions of assessments, or in your tax reports?

A. That was the case, yes, sir.

Q. Some testimony was given in reference to the Milwaukee, Grand Rapids and Detroit companies, showing candle power and price. Have you made any computation as to the cost of illuminating unit, even under these conditions, and of the gas furnished in New York at our candle power?

A. I have, yes, sir, taking Mr. McMillan's testimony. I find that the average price obtained by the Milwaukee, Detroit and Grand Rapids companies to have been 84.95 cents per thousand cubic feet; that the average candle power was 17.8 candles; that the sales per consumer averaged 32,500 cubic feet; 6413 the Consolidated Company's sales for 1905, amounting to 34,031 cubic feet; the average candle power of the gas of the Consolidated Company, as shown by the city tests from July 1st to December 31st, 1905, was 24.18 candles; allowing in the case of the McMillan companies a loss of one candle between the station and the district would make their district candle power 16.8 candles, or about 69 per cent. of the candle power of the gas distributed in New York. Using those factors, it would appear that the customers of the Mc-

Millan companies pay $1.23 per thousand for the same illumination furnished by the Consolidated Company.

Mr. KIRBY: I suppose that we will be permitted to put on experts to review this calculation?

Mr. MATHEWSON: It is a matter of calculation, dispute it if you do not like it. You have to prove even the computation of interest in a law suit.

Mr. KIRBY: Yes, anybody can compute interest, but it takes an expert to compute this.

Mr. MATHEWSON: It is figured on the Edgerton basis of proportion of illuminating service to cost.

Mr. KIRBY: Then it should be in the brief.

The WITNESS: The testimony further showed that notwithstanding the low average price of 84.95 cents per thousand, the McMillan customers consumed but 32,500 cubic feet per annum. This, however, is of 16.8 candle power gas.

6414 Q. Well, does it make the illuminating cost per unit greater or less in those cities than in New York, assuming those figures which were put on the record by Mr. McMillan to be correct?

A. Assuming that the consumer is buying illumination, it is costing them more for illumination there than it is costing the consumers in New York City.

Q. Per candle?

A. Per candle. And furthermore, notwithstanding the low price, the consumption per consumer is smaller than it is in New York.

Q. Now, the question was raised as to the change in the oil contract on November 1st, 1905, and as to the effect of the cost, provided the year 1905 had continued at the prices existing in previous contracts. Have you made a computation so you can show how much difference in cost per thousand it would have made if the prices for November and December, 1905, had continued under the old contract, and how much is it, if you can produce it?

A. The difference expressed in cents per thousand is .13 of one cent.

Q. As a matter of fact, Mr. Carter, and bearing on the use of low gravity oil, the Mutual Gas Company which operates in New York City had no part in this contract of November 1st, 1905, had they?

A. No, sir.

Q. And they continued the use of lower grade oil, did they not, in December, 1905?

A. They did, yes, sir.

Q. And the Consolidated at the same time was using practically all of the 34 degree oil, were they not?

A. That is the case, yes, sir.

Q. What was the actual result in that month as to the cost per candle?

6415 A. The actual result of cost of candle power delivered on the district as shown by the City tests was that the cost was greater to the Mutual Company than to the Consolidated Company.

Q. Yes, the Mutual Company's oil averaged them how much in December?

A. 4.04 cents per gallon.

Q. How much did the Consolidated Company's cost?

A. 4.84 cents per gallon.

Q. Reference has been made to H. E. Gawtrey's statement. Referring to the value of property as of $27,400,000 taken over in 1884 instead of $29,994,000, what is the figure which Mr. Gawtrey gives?

A. The figure given by Mr. Gawtrey, $27,649,060 (page 4862) was the value of the tangible property, $29,994,000, less an amount reserved to retire the outstanding obligations of the old companies, $2,329,000, and sundry adjustments amounting to $15,940.

Q. That has no relation then really to the value of the property, $29,994,000?

A. None whatever. It simply is a statement of stock that was issued for each company assuming however the obligations of the outstanding bonds of the old companies and paying for it in that way.

Q. That is accounted for, is it not, in the same way as the difference between the $37,775,000 of capital authorized and the actual amount of $35,000,000 and something of capital actually issued?

A. That is the case.

Q. In other words, certain capital was reserved to retire the debts of the contingent companies which were assumed?

A. That is the case, yes, sir.

Q. Have you read Mr. Lacombe's testimony?

A. Yes, sir.

Q. As to the account with the city?

A. I have, sir.

6416 Q. Do you find that Mr. Lacombe assumes that the company actually delivered to the city three feet per hour?

A. Mr. Lacombe's calculations are most of them based upon an assumption of 3.77 cubic feet per hour for Welsbach lamps and four and one-half cubic feet per hour for open flame lamp. Mr. Lacombe's conclusions are somewhat in error in that he undertakes to demonstrate that deducting from the amount of the company's bill the amount applicable to the payment for gas that the balance is the cost of maintenance, whereas as a matter of fact the balance is the amount available for maintenance or which the company would receive in payment for maintenance.

Q. In other words, the amount of maintenance is assumed to be the difference between that assumed amount of gas delivered and the amount received?

A. And the total amount of the bill.

Q. You previously testified, or Mr. Addicks did, I think, that the amount of gas delivered was not the exact amount which the bill showed?

A. That is the case, yes sir.

Q. In other words, your bills were made out according to your contract, weren't they?

A. Precisely so, according to Mr. Lacombe's Schedule 6, assuming the consumption of 3.77 cubic feet in the Welsbach lamps and 4½ cubic feet per hour in the open flat-flame lamp the apparent loss to the company for maintenance of the lamp would be $32,072.49.

Q. Correcting the figures to the actual figures which have previously been testified to, do you find that Mr. Lacombe's results differ substantially from the company's?

A. No, in no respect; no, sir.

6417 Q. Prof. Bemis referred to your statement in an affidavit in this case that the services since 1894 have been largely renewed or replaced, with no additional charge to capital except $177,000, and suggested that that meant that you from earnings had increased the construction or property account without showing it, is that the fact?

A. Not at all, sir.

Q. Now, in relation to services, did you pursue any different course than what you described yesterday, merely charging off when you lost or abandoned a service that service at the figure which it was carried on your books, and when you put in a new service, new or to replace an old one, charging that into your property account at the actual cost?

A. That is the method we have always pursued.

Q. But if you removed a long, expensive service and put in a new service, or put in a service when iron is cheaper than when the old service was put it, it might mean a new service at an actual reduction in your property account, might it not?

A. Exactly so.

Q. In other words, the services charged off would exceed in cost the new service put in?

A. In many cases, yes, sir.

Q. Mr. Doane referred to the sales of coke as $3.35 a chaldron, or $4.71 per net ton of 2,000 pounds. Do you know whether that was the ordinary run of coke or whether that was screened coke?

A. That was screened coke.

Q. It did not take into account screenings and the cheaper grades of coke?

A. It did not, no, sir; of which there would be from 15 to 20 per cent.

Q. The defendants brought out the point that the mains on December 31st showed a smaller mileage account than on Oc-
6418 tober 31st, 1901, which is the date at which we have been considering the capital of the company. If you take the mains as of October 31st, 1905, we must take the rest of the properties as of that date, and what would the total result be, greater or less in property account on December 31st or on October 31st?

A. It would be greater on December 31st, taking the total property into account.

Q. And the same would be true at any subsequent date?

A. At any subsequent date, yes, sir.

Q. As a matter of fact, Mr. Doane's figures, to which I call your attention, include, do they not, cost of handling and delivery of the coke?

A. Yes, sir, all the expenses incidental to it.

Q. The defendants have laid stress on the fact that 27.81 miles of the company's mains out of a total of 822 miles were marked "disused." You stated yesterday that where such mains were temporarily disused that you considered them part of the assets of the company, didn't you?

A. Yes, sir.

Q. And that when they are really abandoned they are marked off as abandoned and taken out of the property account?

A. Yes.

Q. What is the total value on the books of this 27.81 miles of disused mains as compared with the total value of $7,852,000, on October 31st, 1905?

A. The total value would be $103,207.01.

Q. Of that $103,000 and over, how much would represent mains under six inches which counsel suggested might not be useful for all the future?

A. The value of the mains under six inches disused is $55,869.11.

Q. Have you the average candle power of the company for 1905 according to the works' tests and the city's tests?

A. Yes, sir.

6419 Mr. Burr: Isn't that already shown from their book exhibited in evidence here?

Mr. Mathewson: No; no such schedule is in yet.

Mr. Kirby: If you keep on long enough we will have it up to the moment of stopping, I suppose.

Mr. Mathewson: I am not surprised that counsel is worried by this testimony.

Mr. Kirby: I am not worried at all by the testimony. I am a little concerned about the possibility for cross-examination.

A. I have such a statement.

Q. Is this it?

A. Yes, sir.

Q. This shows the monthly averages for 1905 as attributed to each one of the works of the company and also the city tests attributed to those works, and the average tests, does it not?

A. It shows those figures, yes, sir.

The paper is offered in evidence.

Received in evidence and marked Complainant's Exhibit 368.

Q. Is it possible by having a single station or a single month to get any relative comparison between city's tests and works' tests, or between the general candle power maintained at the works and the candle power delivered to consumers?

A. I should think not, no, sir.

Q. As a matter of fact, these different stations, so-called, 14th street, 21st street, 42nd street, 44th street and 49th street, related to the constituent companies or five of them before the consolidation, didn't they?

A. Yes, sir.

Q. And the city for the purpose of its testing has still 6420 maintained the same names as to the stations and referred to them as 14th street and 21st street, hasn't it?

A. My impression is they refer to them as New York, Manhattan, Harlem, Knickerbocker, I think they still use the name from the old company.

Q. Still using the old name?

A. Yes, sir.

Q. Isn't it a fact that the mains of the company interlock, and the gas runs around so it is impossible to say for a certainty that the gas which reaches the testing station of the city on the old 14th street mains does not contain gas from some other station?

A. It would be impossible to say that it does not, and I am absolutely certain that it does.

Q. For instance, you take the 42nd street station, isn't it a fact that the gas of the 42nd street station before it gets to the city testing station is mixed with other gas at one of the uptown stations?

A. Yes, sir, either 63rd street or 65th street, or both of them.

Q. Now taking the entire year, what is the average at the works, all stations?

A. 25.34 candles.

Q. What is the average at the city testing station?

A. 22.99 candles.

Q. That shows a drop between the works and the testing stations of how much?

A. 2.35 candles.

Q. Referring to the Standard Company, the Mutual, the New Amsterdam, is it not the fact that they serve a comparatively limited territory in the city, that is that they do not go into every street as the Consolidated does?

A. Oh, no, sir, they have restricted territories. Not restricted in the sense of any restrictions being placed upon them, but they are confined within a limited area.

6421 Q. While the Consolidated has to maintain its candle power even to the remote districts?

A. The most remote districts of the city.

Q. Do you understand there is anything in the law which prevents the city from testing your gas at any point it pleases, at any time?

A. On the contrary, my interpretation of the law is it has such a right to test at any remote point in the district supplied by the Consolidated.

Q. Is it your view that the company must maintain a candle power which will show 22 candles at any point?

A. We would not think of doing anything else than that, Mr. Mathewson.

Q. Mr. Burr, for the defendants, offered in evidence the minority report made by Senator Gilbert of the Committee of 1886. Mr. Gilbert in that report refers to the capital of the Mutual Gas Light Company as $4,100,000, and says that it appears that for that they could produce 4,000,000 cubic feet per day. Is that in fact the capital of the Mutual Company as it appears in that report?

A. It is not, no, sir.

Q. What is it?

A. The actual investment of the Mutual Company as shown by their statement referred to by Yalden was $8,284,515, and eliminating from that anything that possibly could be eliminated on the score of it not being an investment in the gas business, as for examppl, United States bonds and some of their own stock and that sort of thing, would leave at the lowest possible estimate a possible $6,275,904.96 as the investment of the Mutual Company in the gas business, with a capacity of 4,000,000 cubic feet per day.

Q. Do you find that he also assumed an ideal company, costing $15,000,000, and bases that on the names of two witnesses that he mentions?

6422 Mr. **Burr**: Isn't this all matter of argument and for brief rather than to have it brought out in this way at this time? The report is in evidence and whatever deduction may be drawn, it seems to me, is properly a matter of argument.

The **Master**: It seems to me, Mr. Burr, excepting in so far as there is anything in the report which might involve the calculation of an expert on constructions or the effect to be given to any figure therein appearing. That is the idea on which I consider some of the testimony might be rebuttal, but as to that last question I think your objection is entirely good.

Mr. **Mathewson**: If the Master pleases, the report of the minority was offered in evidence by my friend Mr. Burr, but the evidence was not offered in evidence upon which Senator Gilbert purported to make his report, and the evidence directly contradicts the terms of his report. You could not argue it from the evidence because the evidence is not before this Master until I put it here by questioning this witness. That is the point. I shall not pursue this for more than a moment, but I think I am entitled, am I not, under those circumstances, to ask the question?

The **Master**: I did not understand that the matter about which you were questioning was not in evidence here.

Mr. **Mathewson**: No, it is not.

The **Master**: All right.

A. There was no such testimony given by either of the witnesses quoted by Senator Gilbert.

6423 Mr. **Burr**: What quotation have you in mind and where does it appear?

Mr. **Mathewson**: Page 47, "upon this testimony a capital of $15,000,000," and so on, "more than suffices to produce a certain number of cubic feet of gas," assuming I suppose the building of an ideal company instead of the six existing companies.

Q. Now he refers to two witnesses and both of those witnesses testify that a million dollars or more per million feet of capacity would be required, don't they?

A. Yes. The two witnesses were Mr. Graham, the President of the Equitable Gas Light Company, and Mr. Kennedy, the President of the Mutual Company.

Q. Did they testify to any such thing as that?

A. They did not testify to anything of that kind.

Q. You have read all the testimony, haven't you, Mr. Carter?

A. Yes, sir.

Q. Without going into details did you find anything in that testimony to sustain the statements of the minority report as against the findings of the majority?

Mr. **Burr**: I object to that as incompetent. We must have the evidence here upon which he bases his statement.

The **Master**: That is going pretty far.

Mr. **Mathewson**: Well, all right. In order not to take time and in order that the argument may be produced if desired, I will offer in evidence the balance of the volume, report of the committee of 1886, Senate documents 47 of 1886, including the testimony and other things which have not already been offered.

Mr. **Burr**: Do you mean to say you offer all the evidence?

6424 Mr. **Mathewson**: Yes, I offer the whole thing that has not already been offered. I think if it meets with the views of counsel that a stipulation on the record that we may refer to it probably would meet the case—you have copies of it—without printing the whole book.

The **Master**: Yes, why not make such stipulation as that—the record may be deemed in evidence for the purpose of reference thereto by either party without the necessity of reprinting it.

Mr. **Mathewson**: The tabulations and reports are printed and contain the figures, and it seems to me that the stipulation suggested meets all requirements.

Mr. **Burr**: I don't know as to that. You offer it for the purpose of sustaining certain opinions which you have asked Mr. Carter to express with regard to the point, of what was proven before this committee?

Mr. **Mathewson**: No, no. I offer it to show the utter ridiculousness of the proposition advanced by Senator Gilbert in his minority report, and to show the soundness of the conclusions of the majority report which we offered in evidence.

Mr. **Burr**: Well, I think that ought all be before the court.

Mr. **Mathewson**: Yes. The Court won't read it through except as you may refer to it.

The **Master**: As long as part of it is in the rest of it might as well go in.

Mr. **Burr**: Yes, let us make a complete report.

Received in evidence as Complainant's Exhibit 369.

6425 Mr. **Mathewson**: That is all I have.

Cross-examination by Mr. **Kirby**:

Q. Mr. Carter, I refer you to the resolution of the—I think it is of your Board of Directors, or your Executive Committee, I am not sure which, which you referred to yesterday, as the same appears on page 1466 of the exhibits, being part of City's Exhibit 87. Did I understand that this was the first resolution of the kind that your company has passed?

A. Yes, sir.

Q. But prior to this time there had been a similar application of funds for such purposes or similar purposes to those set down in this resolution, had there not?

A. There had been.

Q. Was -here any resolution of authorization for the same?

A. There was not. There is no resolution for the authorization of these expenditures, Mr. Kirby.

Q. This resolution then was for what purpose?

A. The closing of one account into another account.

Q. Had you ever had any previous resolution for that purpose?

A. We have not had previously any such account to close it into.

Q. Which is the new account that you had not prior to this time?

A. Renewal and contingency account.

Q. When did that account commence?

A. Commenced in May, 1905.

Q. And what is that account for?

A. It is an account that is credited monthly with the contingent expenses, calculating at 10 cents per thousand cubic feet sold and charged monthly into the operating expense account.

6426 Q. You might designate that as a depreciation account?

A. What its name indicates—a renewal and contingency account.

Q. Is it ever designated, in other companies, as depreciation account or depreciation fund account?

A. I cannot tell you how it is designated in other companies.

Q. What is its purpose?

A. To accumulate a fund which will be used for——

Q. Renewals?

A. To accumulate a fund which will be employed for renewals and contingencies.

Q. That is, for other purposes than new construction?

A. Always other purposes than new construction.

Q. This account was never carried on the books of your company prior to this time under another name?

A. To which account are you referring?

Q. The renewal and contingency account?

A. No, sir.

Q. The amount set down in this resolution was $282,219.67. Was that money actually spent?

A. As I have already testified we do not attempt to show in that account expenditures.

Q. No, I did not ask you what you attempt to show there, I asked if your money was actually spent?

A. I should testify yes, that it was all spent.

Q. Now, can you tell me for what it was spent?

A. To replace the property that was written off during the year of which that formed a summary at the end of the year, that entry.

Q. Can you tell me for what specific apparatus or parts of plant or mains or any part of your producing or distributing system it was spent?

A. It was expended on the plant corresponding to the items enumerated in that entry.

6427 Q. By that you mean that the sum of $3,424 was spent for renewals of plants, that the sum of $90,561.54 was spent for the renewals of mains, that the sum of $37,401 was spent for the renewal of services and so on as set forth in that resolution?

A. I might qualify that to this extent by saying that if it was not expended during that identical calendar period it certainly has been by this time.

Q. So that the resolution and the amount set down therein took not only of that which had been done but that which was intended to be done?

A. In a measure. We might abandon a main in December, 1905, and not relay that main until January, 1906, in which case the expenditure for the replacement of that main would not appear in the disbursements of 1905.

Q. Then the amount which under this resolution you charged off from your renewal and contingency account and which is there set down as $282,219.67, and which is set down in State's Exhibit L under the heading "renewals, 1905," as $282,219.67, being the same, may or may not indicate moneys actually expended?

A. It is bound to do so ultimately if not within as I say identically that period.

Q. Assume that after the passing of this resolution for some cause unforeseen at that time the work which was then contemplated was not either started or completed, in that instance you would have no expenditure, would you?

A. Well, that was hardly a conceivable condition to my mind, Mr. Kirby.

Q. Now, what you are endeavoring to show I think is that these renewals may lap over into the next year?

A. Or may have been carried over from the preceding year.

6428 Q. Well, if carried over from the preceding year they would have been charged up to the renewal item of the preceding year?

A. Exactly.

Q. But if they lapped over as in this instance—by this instance I mean the resolution we have been referring to—you will not charge them in the renewal account for the year 1906?

A. No.

Q. Having been cared for by that resolution?

A. That would be the case.

Q. And if something set down therein was not carried into effect you would make an adjustment, I take it, in the next year's account?

A. If anything came specifically to our attention of that character that would be done.

Q. So taking this renewal item over the entire period from the year 1884, if there had been any errors of that kind the chances are that an adjustment would have been made and the total would stand as correct?

A. Yes, sir.

Q. Now prior to this year, or rather, 1905, the time when this resolution was passed, having no renewal and contingency account I take it that you designated as your renewals account the moneys which you actually expended for that which your company considered renewals?

A. There was no change in 1905, Mr. Kirby with respect to our method of charging up our depreciation as it accrued. The only charge that occurred in 1905 was in the creation of the renewal and contingency account against which these items were charged at the end of the year instead of being charged to profit and loss account.

Q. So that in 1905 you took it out of this fund which you had created by your 10 cents per thousand cubic feet?

A. Yes.

6429 Q. And theretofore at the end of the year you charged it in your profit and loss account?

A. That is the case, yes, sir.

Q. But the renewal account stands today as it stood since 1884?

A. Yes, sir.

Q. And indicates the actual amount which has been spent each year on renewals of your property, renewals in the sense which you consider renewals?

A. Yes, sir, that is the case.

Q. Now then that does not indicate—that is that amount as set down in your property may or may not have been, does it?

A. Covering the period of twenty years?

Q. Yes.

A. It indicates such depreciation as became evident during that period in any manner or shape.

Q. It indicates as far as your books are concerned, and looking only to the books, taking into account at this time no knowledge which you may have of the plant by inspection thereof that the property may or may have depreciated more than the amount spent for renewals and repairs, may it not?

Mr. Mathewson:

Q. Would the book account itself show anything on that subject?

A. The book account would indicate nothing whatever; inspection of the plant might.

By Mr. Kirby:

Q. We are confining ourselves to the book account?

A. The book account would not indicate that, no.

Q. In other words the plant may have, for all the books would show, have been "tottering to its final collapse?"

A. Except as the amount, Mr. Kirby, expended would appear to have been adequate to maintain it at a high standard of efficiency and in good repair.

6430 Q. Now, you are using the mind of an engineer, and I am trying to keep ourselves to that of an accountant.

Mr. Mathewson: Even an accountant may know something.
Mr. Burr: But he never built a gas works.

Q. That is true, is it not?

A. That is quite true. Of course, you will agree that in the course of twenty years, starting with a plant or with several plants all of which had been in operation for a great many years that a great many things would transpire during the twenty odd years, during the history of the Consolidated Company, that would not transpire in the history of a company that started *de novo* twenty years ago.

Q. Quite so. Now you, with that knowledge which has come to you as one familiar with figures, as also one who has been closely associated with engineers and familiar with gas works on your own account and the company's experts have also testified that the plants are in first-class condition, I presume that taking this in consideration you considered that the amount spent in repairs and renewals has been sufficient to offset all depreciation?

A. Well, I would not like to say that, Mr. Kirby, because men more experienced than myself tell me that it has not and that there is still a condition that we should provide against.

Q. So you may still have them "tottering," for all that you know?

A. Not in any respect apparent in the plant as it exists to-day; the plant as it exists to-day giving no indication of it whatever, but nevertheless long experience leads them to believe that conditions are liable to arise in the future that the company should provide 6431 for by a suitable reserve which I consider no reflection whatever upon the condition of our plants as they stand to-day.

Q. They seem all right, but they may be all wrong?

A. They seem and are all right, but for reasons which we are unable to foresee now we may have to replace them with other kinds or other types of gas-making apparatus at some time that we know not of to-day and that we should be prepared to do that and that the business has got to provide for that.

Q. I call your attention to Complainant's Exhibit 79, to which you made reference yesterday, being page 347-A of exhibits, and ask you if you will look with me at the second column thereof, headed "Construction since Consolidation." Now, excluding the item of real estate with which we are not concerned at this time, I take it that all the totals set down in that column indicate the actual expenditure has been made, whether it be for new construction or whether it be for renewal?

A. That is the case; yes, sir.

Q. Now, am I not also right in assuming that the total for those expenditures, excluding as we may in the expenditure, the expenditure for real estate, comes from two sources, from capital and from earnings?

A. That is the case, yes, sir.

Q. Now, coming to the third column, headed "Depreciation (renewals) since Consolidation" I take it that all of the items set down therein indicate the amount expended for other new construction?

A. That is the case, yes, sir.

Q. Now, will you state to me from what source the expenditures in that column came from, from capital or from earnings?

A. From earnings, Mr. Kirby.

6432 Q. And the amount spent for new construction and spent out of capital is set down under the heading "Net increase," being the fourth column of this table?

A. That is correct, yes, sir.

Q. The sixth column, headed "Expenditures and Repairs since Consolidation, to October 31st, 1905," represents that which was not spent either for new construction or for renewals and which amount was spent out of earnings?

A. Yes, sir.

Q. So that the total of amount spent for new construction, being the total set down in the column under the heading "Net increase," the amount spent for renewals, being the total set down under the third column, and the amount spent for repairs, being the total set down under the sixth column, would represent the total amount spent by your company out of capital and earnings since 1884 for other than labor and expenses, and in the actual manufacture of your product?

A. And other expenses of manufacture and distribution than these.

Mr. Mathewson: These items here of property, Mr. Kirby, you ought to know, represent not all our items of property; that is the expenditure on those particular items; because we have material and supplies, working capital and other things which are not in here at all.

Mr. Kirby: Very good, we will exclude them, and such items as are not in here are those which I think Mr. Carter had reference to.

The Witness: Yes, anything, of course, not covered in this table.

6433 Q. Now, taking up the amounts spent for new construction, I ask you if you can indicate to me just what you mean by new construction. To aid us, I might sug-est an example to you. If you put up an entirely new building I presume that would be new construction, would it not?

A. Yes, sir.

Q. If you installed an entirely new apparatus I take it that would be new construction?

A. Not replacing apparatus already in use?

Q. No.

A. That would be new construction, yes.

Q. And a new additional piece of apparatus?

A. Yes, sir; that would be new construction.

Q. If you put in a new additional main, I take it that would be new construction?

A. Yes, sir.

Q. And all those expenditures would be out of capital and not out of earnings?

A. That is the case.

Q. Let us assume that we have a certain number of benches at a station, and we add to that number, the addition would be new construction, would it not?

A. Yes, sir.

Q. Or if we add additional water gas apparatus, that would be new construction?

A. Yes.

Q. Now suppose that instead of adding to the old apparatus you tear the old out and put up apparatus with greater capacity, but no greater efficiency, would that be new construction?

A. The cost of the new apparatus and of its installation would be charged to construction account, and the value at which the apparatus dismantled was carried in our construction account would be deducted from it.

Q. So that the total of the new apparatus would not be charged to new construction?

A. Not as an addition to new construction, assuming that the new apparatus cost the same amount at which the old apparatus was carried on the books, the result of the entries would leave the total value of the plant account identically the same as it was before. 6434

Q. Quite so. Now would that new apparatus be paid for out of capital or out of earnings?

A. In that event the new apparatus would be paid for out of earnings.

Q. And that would be the case irrespective of the cause which necessitated the change?

A. Yes, it would be irrespective of the cause which necessitated the change. Assuming always that it is a piece of apparatus replacing or superseding a piece of apparatus already in use and of a corresponding value, my answer is that there would be no change in the status of the capital account and that the cost of the new apparatus would be taken out of the earnings of the company.

Q. If, let us say, a community ten years ago was taking a certain number of cubic feet of gas and demanded no more, and that community so grew that it would need to-day two, three, four or five times the number of cubic feet of gas which it did at that time, and your apparatus while efficient was not large enough to produce the number of cubic feet of gas necessary to supply that community, and your real estate holdings were such that you could not extend your plant and build additional units, and that it, therefore became necessary for you to tear down your present apparatus, which was in first-class condition and as efficient as the present apparatus which you would have to instal, and you did tear down that old apparatus so as to serve the community; would the entire cost of that larger apparatus be charged to new construction or would it be charged to renewals?

6435 A. The cost of the new apparatus to the extent of the value of the old apparatus would be charged to renewals.

Q. And what value would you give to the old apparatus?

A. The value at which it stood upon the books—its cost value.

Q. And only to that extent would you pay for the new apparatus out of earnings?

A. Only to that extent, to the extent of the value of the old apparatus.

Q. So you would make no distinction between the supersession of apparatus or buildings or what was not, due to increased demand of the community, or due to unfitness of the apparatus for causes of inefficiency or non-workability, or things of that sort?

A. No discrimination, no, sir.

Q. Now, you carry that theory also into the replacement of your mains, I take it.

A. Yes, sir.

Q. Assume a case there; you run a six-inch main into a small community; it is sufficient for the demands of consumers at the time it is put down; that demand grows; you need twice the capacity which you formerly did; you put down an additional six-inch main; what is that charged to?

A. An additional six-inch main?

Q. Yes.

A. Capitalized.

Q. Paid for out of capital?

A. Yes.

Q. And new construction, and credited to plant?

A. No, charged to plant.

Q. Yes, charged to plant.

A. Yes.

Q. Assume that instead of putting down a new six-inch main you had replaced the original six-inch main by one which would carry twice the quantity of gas, what would you do in that instance?

A. And take out the old main?

Q. Yes.

A. It would be depreciated to that amount.

6436 Q. And in that instance the cost of the new main would be charged entirely to new construction, but——

A. It would be charged entirely to new construction, but the construction account as a result of the transaction would be reduced by charging off the value of the old main.

Q. And paid for not entirely out of capital, but only the difference of the book value of the six-inch main, and the book value of the twelve-inch main would be paid for out of capital?

A. That is the case.

Q. In other words, you put upon the consumers such cost and expense which might not have been placed thereon if the company had had foresight enough to have installed a large main in the first instance.

A. You must bear in mind that if that foresight saw so far ahead that the ultimate installation of the large main was anticipated, that the customers would have to bear the burden of that main for a great many years before it was required.

Q. That might be true, but if that twelve-inch main or nine-inch main, whatever it might be—I have not figured what the capacity of twice six would be—had been installed in the first instance, the entire cost of installation would have been out of capital, would it not?

A. Yes, sir.

Q. I neglected to ask you, although I think there is no doubt whatever in our minds, but the total of this third column, depreciation and renewals since consolidation, represents moneys actually expended?

A. Yes, sir.

Q. With the small qualifications which you referred to?

A. Yes.

Mr. Mathewson: There are no qualifications to that, Mr. Kirby.

6437 Mr. Kirby: Yes, that includes, I take it, 1905, and 1905 includes the amount set down in Exhibit L, which is the identical amount set down in the resolution, and which amount as set down in the resolution has certain small items going to make it up, and all of the amounts of the smaller items may not as yet have been expended, as Mr. Carter has testified. I do not think we misunderstood each other.

The Witness: It would be a negligible and small amount, possibly spent in January, 1906.

Mr. Kirby: And which Mr. Carter has said spread over that entire period might be entirely wiped out.

The Witness: Yes.

Q. Now, I have endeavored to draw a line between renewals and new construction. Let us see if it is possible to understand each other on the line between renewals and repairs; so we may have a concrete example before us, I will ask if you will take up the alterations of the 21st street plant, which you spoke about yesterday. You have stated you were quite familiar with what these alterations were. I ask if you will tell us when they were made and what they were, and such part of them as was charged to new construction and such part as was charged to renewal, and such as was charged to repairs?

A. The facts, as nearly as I recall them, briefly, are that certain oil gas benches at the 21st street station were dismantled and generating apparatus of the Lowe type installed in their place. To enable this to be done, the walls of the building had to be raised and a new roof put upon the building.

6438 Q. So that I may not lose the trend of this, if you have not stated it all, we will take up just as far as you have gone. You say the walls were raised. Do you know which walls were raised?

A. The walls of what was known as the generator house on the block bounded by Avenue A, East River, 21st and 22nd streets.

Q. And were all four walls of that building raised?

A. I am under the impression that they were; I am not quite positive on that point.

Q. Is it not a fact that the new roof of which you speak is supported by Phœnix columns?

A. Yes.

Q. And if that is so, are you still of the opinion that all four walls were raised?

A. I have not expressed the opinion that they were; I don't know whether they were or not. My impression is that they were, all four, but I am not sure of it.

Q. Don't you think that would produce a rather unusual arrangement of the buildings or rooms under one large roof, which is supported by Phœnix columns, and which, therefore, needs no support from the old walls of the houses which are now underneath?

A. The building on that block is rather a combination of buildings formerly separated, and it is because I feel a little doubtful about that, and am not perfectly familiar with all the changes, not having particularly noted them at the time——

Q. I took it up because you referred to it yesterday.

A. I referred to the records in the books of what was done at that time at that station.

Q. Well, now, what do your records tell you?

A. The records tell me that the walls of the building were raised, that a new roof was placed upon it, and certain apparatus was dismantled, and certain new apparatus was installed.

6439 Q. But you cannot tell us in detail which walls were raised.

A. Whatever walls had to be raised to accommodate the new apparatus that was installed there, were the walls that were raised.

Q. Yes, but you do not know which walls had to be raised to take care of the new apparatus?

A. No.

Mr. **Mathewson**: My question was merely directed to the point that this building has substantially changed since Mr. Rowland had made his valuation.

Mr. **Kirby**: It was directed toward certain other points and Mr. Carter under your kindly questioning seemed to be entirely familiar with the construction of the building and apparatus and what was there and what was not there.

Mr. **Mathewson**: No, you come to another question when you reach the apparatus.

Mr. **Kirby**: We will reach that in good time.

Q. Do you know what happened to the roofs of these buildings when this new and larger roof was thrown over all the buildings?

A. What happened to the roofs? *A*. Yes. Do you mean what disposition was made of the old roofs?

Q. Yes. Are they still there?

A. Why, no, the old roofs were removed.

Q. Now, let us take the method of charging up the different expenses to which the company was put in making this alteration. Here are large columns erected, a new roof thrown over them. Is that new construction?

A. Part of it was new construction and part of it was in the nature of repairs.

Q. Now, how did you draw the line, and where did you draw the line?

6440 A. It was drawn at the time by people who were very familiar with the work and what was done.

Q. But you yourself are not competent to draw that line?

A. At this time? From book records of a transaction fifteen years old?

Q. You cannot tell us to-day where the line was drawn?

A. Only as indicated in the book entries, and I presume it was made in accordance with the facts, which were matters of the knowledge to the people who made those entries at that time.

Q. We will assume it was made in accordance with the facts within the knowledge of the persons familiar with it at that time.

A. I believe it was.

Q. You are familiar with the books?

A. Yes.

Q. I ask you if you can tell us, and if you cannot, you can say so, to what account the cost of putting on this new roof was charged?

A. A part of it was charged to repair account and a part of it to construction account; it was a better roof than was on the building before, and justified the division of the cost of it between those two accounts.

Q. And you would consider the putting on of a new roof, encompassing, if you might say, all these buildings, a repair?

A. I have described what it was. It was not all repair, nor was it all new construction, but the entries in the books recognized the fact or reflected the fact that a better roof had been put upon the building than was there before, which justified a charge of a portion of the cost of that roof to construction account, and such a charge was made.

Q. As a matter of fact, this roof was practically a roof and the walls therefore, and the new columns—it was practically a new building within the limits of which was contained these old buildings?

A. Well, that is your designation of it.

6441 Q. Well, is it not yours?

A. I think that the building was very greatly improved, and its capacity very considerably increased.

Q. Well, we won't differ on that.

A. And that the method by which the accounts recorded what was done was perfectly in harmony with the facts.

Q. Oh, yes, I take it it was in harmony with the facts as those who performed the work and those who had charge of distributing the account thought was proper and right?

A. Yes.

Q. And while I am not trying in any way to state whether or not they were correct I am endeavoring to get those facts.

A. I am endeavoring to give them to you, Mr. Kirby.

Q. But you can simply give them to me in a general way of this kind, and cannot give me any——

A. I can give you the book entries and the figures in detail, if you wish them.

Q. I think it would be most interesting to have them.

Mr. Mathewson: That is not the point. Do you want them? A good many things would be interesting.

Mr. Kirby: Yes, I want them. Mr. Carter seems to have stated his familiarity with the work, and I think inasmuch as he came to a conclusion, we are entitled to the data on which he based his conclusion, and I would like to see the distribution of charges at the time of the alteration of the 21st Street works, to which he made reference yesterday, and which I would not have thought of going into if he had not mentioned it.

Mr. Mathewson: And which we would not have thought of going into if Mr. Edgerton had not volunteered the suggestion that
6442 he suspected things were still carried to construction although they had been done away with at 21st Street, that is the reason we went into it.

Mr. Kirby: I am very glad to know the reason, I did not know it before.

The Master: This is very interesting but counsel had better understand that this cross-examination cannot proceed on the theory that I am going to sit an indefinite time.

Mr. Kirby: I aim to make the cross-examination as brief as possible, notwithstanding the fact that the direct testimony took a day and a half, and Mr. Carter answered at railroad speed, and the record came to us half an hour before the hearing this morning.

Mr. Mathewson: We took less than an hour this morning, Mr. Kirby.

Mr. Kirby: I do not want to pursue this course of questioning if it is not going to be fruitful of any results, Mr. Master, but I think that in the light of yesterday's testimony in reference to the 21st street plant, and Mr. Carter's assumed familiarity with it, that we are entitled to know just what was expended, and when it was expended, and if he doesn't know that he can bring a statement showing it.

The Master: I only wish to warn you that the cross-examination of Mr. Carter now cannot proceed on the lines it did before, of calling for various elaborate statements and things from the books, and go on assuming we are going to occupy some days in this examination, because we have not time, and Mr. Mathewson has stated he has several other witnesses to call.

6443 Mr. Kirby: This is an offer on Mr. Carter's part. Now, if he does not know, and states that his familiarity with the plant is not such that he can tell, I am quite willing that the answer should stand that way. But if he does know, and it is by reason of his knowing that he answered yesterday, then I take it we are entitled to pursue it to its logical conclusion.

The Witness: I might explain in a moment how much information I would be able to give you on that subject. The entries by which the dismantled apparatus were taken out of plant account and charged to depreciation account. I have with me now as a memorandum, and would be glad to show them to you or read them into the testimony. With respect to the repairs to the building, which account bore a part of the expense of raising the walls and substituting a new roof for the old one, it would be difficult to identify in the cost of repairing buildings in that year, the identical amount that was expended in repairing the generator house. The method, however, by which certain expenses in that connection were distributed is indicated by the entries in the books; and my recollection is that the cost of raising the walls was distributed between the construction and repairs to buildings account on the basis of two-thirds to construction and one-third to repairs to buildings, and that the cost of substituting a new roof for the old one was divided between construction account and repairs to building account on the basis of one-third to construction account and two-thirds to repairs to buildings account. With respect to the dismantling of the 6444 oil gas benches, the amount at which the benches and foundations were carried on the books of the company, was charged off. The benches were carried, to the best of my recollection at $108,000, and that amount was written to depreciation account. The foundations were used as foundations for the new apparatus in whole or in part, and such parts as were not so used was charged off at the value at which that property was carried in the books.

Q. You have those items in regard to dismantling of benches?

A. Yes.

Q. I think it would be relevant and proper to state what those amounts were and how they were charged.

A. In 1901 an entry was made charging off $108,000, "that being the amount"——

Q. Charging off from what?

A. The construction account "that being the amount of the scheduled valuation of sixty benches of six retorts each, to be taken down from block bounded by Avenue A, East River, 21st and 22nd streets, to make room for a new generator plant: each of said benches were inventoried at $1,800, and the valuation of November 11, 1884, inclusive of the foundations. The foundations are not to be removed, but will be utilized as the foundation for the new generator plant."

Mr. Mathewson: That quotation is from your books?

The Witness: Yes.

Q. Does that memorandum that you have make any reference to walls raised, I mean by that increased in height?

A. I was correct in my testimony to the effect that two-thirds of the cost of raising the walls was charged to construction account.

6445 Q. By raising, you do not mean removing them, but increasing them in height?

A. Increasing them in height, and that one-third of the cost of repairing the roof was charged to construction account.

Q. What do you mean by repairing the roof? There was an entirely new roof put over that part of the plant?

A. Well, I have already testified that I do not know that it was entirely changed.

Q. But whatever it was, that was the way it was charged?

A. It was charged to repairs of buildings, two-thirds of it, and one-third charged to construction account. I think it would have been difficult at that time to have divided it up on the basis of construction and depreciation, for I do not think that any records that the company had showed the value of that roof.

Q. If you did in fact put a new roof on any building would that be a repair or a renewal?

A. It would be a repair, if it was simply the replacing of an old worn-out roof with a new roof and nothing else.

Q. If you tore out part of your benchwork by reason of its having been burned out from some cause due to its use, would that be a repair or a renewal?

A. Well, I would like to have you define that a little more exactly, if you will be good enough, Mr. Kirby.

A. Well, we have certain brick used—— Oh, the substituting of new brick for old firebrick in a retort?

Q. Yes.

A. It is repairs.

Q. If you tore down all of the stack of benches and put a new one in its place?

A. Tore down an entire stack of benches and substituted new benches?

Q. Yes.

A. Of the same design and for the same purpose?

6446 Q. Yes.

A. I think it would depend considerably upon whether there was any great difference between the cost of the new benches and the old, whether we treated them as repairs, or whether we treated it as dismantling of the plant, and substituting of new plant; assuming no considerable difference between the cost of the new and old, the probability is that the expense would go right to repair account; as a matter of fact I don't know of anything of that sort ever having been done in our practice.

Q. You do not draw any close line between your repairs and renewals, do you?

A. We do draw a very close line, we think, but we know very well that there is always included in repairs what might technically be termed renewals of small parts, but as repairs; as for example, the replacement of burnt out fire brick with new firebrick, it is to all intents and purposes a renewal, but it is uniformly considered as a repair.

At 1:05 P. M. adjourned to 2:15 P. M.

After Recess.

Robert A. Carter resumes the stand and further testifies.

Cross-examination by Mr. **Kirby** (Continued):

Q. You have spoken of the walls of the 21st street station as having been raised, by which you meant raised up. Do you know whether any of them were razed down, or any of them were removed?

A. I have no knowledge of any, no, sir. I used the term 6447 raised in the sense of being elevated.

Q. So I understood. Yesterday you referred to Mr. Edgerton's testimony where he was considering the value or his appraisal of the 21st street plant, and stated that there were no foundations there upon which apparatus had not been erected and which were not there at the present time. I correctly state your testimony or the sense of it, do I not?

A. Substantially, yes, sir.

Q. Now, I call your attention to the schedule of buildings of 21st street station, to the schedule of buildings as prepared, I believe, by Mr. Mayer, in any event as submitted to counsel for the defendant by Mr. Addicks of the Consolidated Gas Company, of which I have a copy here, my original having been mislaid. The first building is that of the "stove storage and meter proving shop," which is referred to by Mr. Mayer at pages 1370 and 1475 of his testimony, and which has certain description which I will not read on account of its length. After the description comes the words "foundations for machinery." I ask if you will tell me what foundations are in that building and what apparatus stands upon those foundations?

A. My understanding is that the building referred to is on the corner of 22nd street and First avenue, the southeast corner, and my understanding is that there are no foundations nor machinery in that building.

Q. So that when Mr. Edgerton in making his appraisal gave no valuation for foundations in that building, was he correct?

A. Foundations for machinery?

Q. For machinery, I mean; not for the building itself.

A. That is my understanding, yes, sir.

6448 Q. So Mr. Edgerton was not in error in that respect at all events.

A. No error in saying there are foundations there upon which there was no apparatus—that he saw foundations there upon which he saw no apparatus, I think he was in error in that statement.

Q. If you will refer to Mr. Edgerton's testimony you will find that he did not use that language, it was Mr. Mathewson who used the language and asked him the question, and that thereafter Mr. Edgerton in answer to a question of mine stated distinctly that he neither saw the foundations nor any evidence of them. I also call your attention to the description in this same schedule, to the buildings, meter repair shop and office referred to by Mr. Mayer at the same pages which I have already given, and after the description of which there is likewise the statement foundations in that building for machinery, or machinery upon foundations?

A. I presume that that building is on the corner of 21st street and First avenue, being the northeast corner. My understanding is that there are no foundations there for machinery, nor machinery in that building. There may be foundations for work benches, where the men work at the meters, but of that I am not sure. I am inclined to think not. If there are any I am inclined to think that they were not included in any valuation by Mayer or Rowland.

Q. I call your attention to the description, being the station repair shop (pp. 1370 and 1476), where in the schedule after the description appears the same words "foundations for machinery" and ask you if you are aware of any foundations or machinery upon foundations in that shop?

A. I believe that there are foundations in that building for machinery, both foundations and machinery.

6449 Q. Now, will you state what that machinery is?

A. The machinery is such as would be required for repairing the stoves, cleaning them, and the foundations would be such as would be required to support the steam engines and gas engines that are used in that department, in supporting columns upon which there is shafting and belting and machinery and foundations of that character.

Q. Your information accords with that which Mr. Edgerton uses in his calculations. I was misled about "none" there, which is contrary to my notes, which state that the machinery foundations in this building were very small and are included in this figure of the building. I did not intend purposely to mislead you, but coming to the pre-payment meter shop (pp. 1370 and 1476), where in the description are stated the words "foundations for machinery," I ask if there are any foundations in that building or any machinery upon foundations?

A. My understanding is that there is no machinery there nor any foundations for machinery.

Q. Now, these buildings of which we have been speaking are those which are contiguous to each other and to which the repairs or alterations or whatever you do call them, about which we are speaking this morning, were made, were they not?

A. No, these buildings are not on the same block as the building to which reference was made in the testimony this morning.

Q. So that we may understand each other in this, this station shop to which I called your attention first is next, is it not, to the meter repair shop and office?

A. The building to which you drew my attention first was not a stove shop, but it was a store room for stoves and meters, and a meter proving shop.

6450 Q. It was spoken of by Mr. Mayer in that way, and that is the reason that I used the designation but whatever it is, the building to which I called your attention is contiguous to it, is it not?

A. No, it is not. One is on the corner of 22nd street, the first one on the southeast corner of 22nd street and First Avenue, and the second building to which you referred is on the northeast corner of 21st street and First Avenue.

Q. And there is a building in between these two then?

A. There is a building in between, which is the stove repair shop to which you have referred.

Q. So those three buildings take up the entire block and are contiguous to each other?

A. They are; that is a fact, yes, sir.

Q. I call your attention to page 6315 of your testimony of yesterday, where you state as follows:

"The fact that the coke delivered from the 14th street station to the Water Gas Stations for use in the generators has to be carted some distance at the 14th street station operates to increase the cost at the 14th street station as compared with the Central Union station, where the water gas plant is adjacent to the coal gas plant."

And I ask to which station the cost of carting the coke is charged?

A. To the coal gas station.

Q. So that the cost of production of water gas has not charged against it the cost of hauling the coke from the point where it is made to the point where it is consumed?

A. No.

Q. This is not the course you follow when you sell coke to outside consumers, is it?

A. The amount paid for the coke by the water gas stations, as in the case of the amount paid by any other consumer, is supposed to cover the cartage of it.

6451 Q. But the amount charged against the water gas station does not include the cartage?

A. If they do not pay it separately it must be included there.

Q. Well, is it included?

A. In the price that the water gas stations pays for it.

Q. If the water gas station pays——

A. It is an item charged against the coal gas station, the bill for carting that coal is charged against that coal gas station, and they pay for the cartage of it.

Q. If the water gas station paid for that cartage the cost of production of water gas would be greater than it is stated?

A. If they paid the bill directly for the cartage in addition to paying for the coke the cost of the water gas would be augmented to that extent.

Q. And the cost of the production of the coal gas would be lessened by the same amount?

A. Would be diminished to that extent.

Q. When you sell coke to the outside consumers you said this morning that you did include the cost of cartage?

A. Yes.

Mr. Mathewson: At the rate which was specified.

The Witness: Yes.

Mr. Mathewson If it is delivered to the consumer, if he goes to the yard he gets it at a lower price, as appears in the testimony.

Q. And if the water gas station instead of taking the carts from

14th street sent their own carts to get it, the water gas station would have to pay for the cartage, would it not?

6452 A. Yes, and I have no doubt that they would get it at a lower figure.

Q. So that then the amount which the water gas station is charged for coke must be sufficient not only to pay for the coke as such, but for the cartage?

A. Well, I think that would be fair to presume, whatever the price might be. Of course, you will understand that in our cost of operating and manufacturing gas it don't make a penny's difference at what price we debit the water gas branch, or credit the coal gas branch with coke. It would be an arbitrary figure anyway, and the net result would be identically the same, whether we raise or lower that price, or whether we put the cartage against one station or the other.

Q. There is no doubt about that whatever, the result over the whole production would be the same?

A. Yes, sir.

Q. In this same connection I would call your attention to State's Exhibit ZZ, summary of operations for the calendar year ending December 31st, 1905, 44th street station, where I find a credit to the coal by certain residuals, including coal tar, in the amount of 857,616 gallons. That oil tar was obtained from the water gas station, was it not?

A. That is the water gas station that you are referring to now.

Q. From this water gas station?

A. Yes, sir.

Q. And is not credited to the oil used in that station, is it?

A. It is credited against the cost of gas at that station and operates to reduce it as shown there in the statement.

Q. It is, however, credited against the cost of coal, is it not?

A. Well, no, it is simply shown as an item in the sheet, it is not credited against the cost of coal.

6453 Q. I see here: "Coal used in generators, used under boilers, labor employed on coal, cartage employed on coal," making it a certain amount and getting a total of 6.27; then we have residuals, oil tar so much, and reduce the cost per thousand cubic feet made .7 of a cent, which being reduced from 6.27 gives a resultant of 5.57. It looks very much from that as though it were credited against the cost of coal, does it not?

A. It might look that way. If that were the case it would state that the net cost of coal was so much; it would be of course entirely misleading and erroneous; the two have nothing to do with each other.

Mr. Mathewson: I presume that you and your experts understand that you do not get oil tar from anthracite coal?

Mr. Kirby: We presume it, but the account does not indicate it.

Mr. Mathewson: It does not indicate one way or the other, you must know it.

Q. Now, do I understand from what has just been said and your previous testimony in this case that you do not consider that crediting oil tar in this way and charging coke cartage in this manner increases the cost of manufacture of the water gas, and diminishes the cost of manufacture of your coal gas?

A. Why, no, you cannot understand me as testifying to anything of that kind at all.

Q. Well, does it not diminish the cost of manufacture of your water gas to an amount which it would be, other conditions being equal, if these credits were not made to the coal gas part of your plants, or of your company?

A. I don't understand that to be the case. The water gas station would have to have fuel of one kind or another.

6454 Q. And having fuel, would be charged with the amount thereof?

A. And as so charged. The station cost is very properly credited with any residual product resulting from the process of manufacture, so that the cost as shown in our books and exhibits stands net.

Q. But the crediting under the heading of residuals of the oil tar to your coal augments the cost of the oil which is used in the manufacture of your water gas over and above that which it would be if such tar were credited to the oil direct?

A. No, it wouldn't have any effect on it at all. In fact, according to report in the first place, there was no credit to coal. At some point in the statement of operations the residual oil tar has got to be deducted and it is a matter of convenience that was deducted at that point, and has no significance whatever and any one familiar enough with the report to criticize it should know that cost of gas oil used at that station would be the gross amount less the amount of residual oil shown in the report. It is not credited anywhere, it is shown in our books on a separate item by itself, it is just simply a tabulation of items of cost and of credits that appear upon our books. There is no credit to coal account in our books of the residual tar that we obtained in the process of manufacture.

Q. And in preparing the statements you considered this would make a fair and proper statement of the cost of manufacture at your various stations?

A. Perfectly fair and proper, as they are items of expense, and every item of credit appears in that statement.

Q. And the distribution is considered by you to be a proper one?

A. Perfectly proper.

6455 Mr. Mathewson: Field's analysis, which you have quoted and brought in shows it in that very way, unless I am very much mistaken.

Mr. Kirby: Yes, and I think you will find that the coal and the tar in the statements made in Field's analysis proceed from the coal.

Q. Yesterday you had occasion to state that you had made a careful examination of Field's analysis and that the amount obtained for ammoniacal liquor or sulphate of ammonia as set down therein was the gross amount and not the net amount. I ask if you will show me the statement or give me the information which you used in coming to your conclusion?

A. I shall have to correct you in quoting me. I did not say I had made a careful examination of Field's analyis. In reply to a question by counsel I stated as my opinion that the amount reported in Field's analysis as the receipts by the company from the sales of ammonia and of sulphate of ammonia was the gross receipt and not the net receipt after deducting the cost of the conversions of the ammoniacal liquor into sulphate of ammonia.

By Mr. MATHEWSON:

Q. Return on capital invested in the plant?
A. Or return on capital invested in the plant.

By Mr. KIRBY:

Q. Having come to an opinion you must have had some information before you to reason upon. I would like to know what that information was. You did not get it, did you?

A. No, I have had occasion for some years to scrutinize the 6456 reports of the operations of all of the London companies and am more or less familiar with them, and I have never seen anything in any of their reports to indicate that they made a practice of reporting the receipts net.

Q. Well, I notice in regard to the price received for your coke you deduct handling, other labor, cartage, e-c.; that reduces the net receipts for coke, does it not?

A. Our report states all of those things in detail and we do not deal with any net figures in our books, reports or statements in which respect our method would, I think, correspond with that of the London companies, and the expense attending the sale of any residual product or the handling of it would be stated as an item of expense.

Q. And in regard to the tar, is the balance of your tar account the net receipts per ton or the gross receipts?

A. Per ton of what?

Q. Per ton of coal used?

A. It is the gross amount received.

Q. Now, if it be that this amount as set down at so much per ton, that is, the ammoniacal liquor and sulphate of ammonia, is so much per ton of coal or so much per thousand cubic feet sold, giving a gross amount, and it is sulphate instead of ammoniacal liquor, there must naturally be some account to which the cost of the sulphuric acid would be used in producing the sulphate of ammonia would be charged?

A. I have no doubt there is, but the report don't indicate it, nor does it indicate the labor. It is not given in sufficiently elaborate detail to furnish that information.

Q. So that you are not prepared to state where such charges have been made, or where in your opinion such charges would be made?

A. The charges I have no doubt are made in their regular expense accounts.

6457 Q. Can you point out to me in Field's Analysis such account as you consider it would be charged into?

A. I cannot tell what it would be charged into. I can perhaps indicate what it probably is charged into. I should say that the wages paid would be charged under the item of salary and wages. That is the only item.

Q. If so charged then the total of labor set down under this item would not indicate the cost of making gas, would it?

A. Not exclusively, possibly.

Q. Is it your opinion that the tar per gallon as set down here is not the amount which the company receives for each gallon of tar sold?

A. Why, no, I think it is the amount that they receive for each gallon of tar sold.

Q. And do you not think that the amount under "Tar and its products per thousand cubic feet sold" is the amount which the company receives?

A. I have no doubt that it is.

Q. And such is also true of breeze per thousand cubic feet sold, is it not?

A. Well, without checking those figures, Mr. Kirby, I would not like to assume too much about them. They are probably all susceptible to checking as to their accuracy by dealing with the various factors that appear in the statement.

Q. Wouldn't you assume or wouldn't it be reasonable to your mind if it be a fact that the amount received per thousand cubic feet sold as set down in this table for coke breeze, ammoniacal liquor produced, the total receipt for residuals per thousand cubic feet, that the amounts for tar being net there your other amounts would be net?

A. I don't think there is any inference of that sort to draw. The amount for tar is both gross and net. I have no doubt they 6458 endeavor to sell it as it comes from their apparatus by the gallon, as the gross amount they receive for the tar.

Q. You have just stated you considered the amount which it received for that tar was the net amount?

A. Gross.

Q. No, just a few minutes ago, not in your present statement?

A. Well, I have not stated anything to the contrary to what I state now at any time in my testimony.

Q. Then do we understand you to say in reference to the tar and its product as the amount set down here received per gallon and per thousand cubic feet sold is the gross or net?

A. It is the gross.

Q. Wherein would it differ from the net?

A. I don't think in any respect nor I do not believe they make any use of their tar either that to sell it as tar.

Q. And if they sell ammoniacal liquor do they make any use of it other than to sell it as ammoniacal liquor?

A. The company I had opportunity to look over in that respect, so far as their accounts were concerned, did not sell any ammoniacal liquor.

Q. Then where do you get the information upon which you base your opinion that it is a gross amount if the company——

A. But they sell sulphate of ammonia, and I have no reason to think that it is not the gross amount.

Q. Have you any reason to think that it is or is not?

A. Yes, I have a reason for thinking that it is the gross amount.

Q. What is that reason?

A. The reason is that it figures out about the average wholesale price obtained here.

6459 Q. Now, I call your attention to the following items as the same appear in Field's Analysis for the year 1905, and as the same have reference to the sale of residuals by the London companies, taking the average of the Commercial and South Metropolitan companies, coke per thousand cubic feet sold per ton of coal, 4.99 pence; breeze, per thousand cubic feet sold, .32 pence; tar and its products, per thousand feet sold, 1.15; ammoniacal and sulphate of ammonia, per thousand feet sold, 2.09; total residuals, per thousand feet sold, 8.55; and ask you if it is not a fact that the total per thousand cubic feet sold or 8.55, is not the total of the amount which I have given for the four residuals spoken of, coke, breeze, tar and its products, ammoniacal liquor and sulphate of ammonia?

A. I think quite likely. I think that those figures are right, without adding them up.

Q. That being the total of those figures would not in any way change your opinion that the ammoniacal liquor and sulphate of ammonia, as set down for these three companies, the average of which is 2.09, as I have given you, is gross and not net?

A. No, it would not change my opinion any.

Q. And your opinion that it is gross is based upon the price to which you have certain information as to how much is obtained abroad for sulphate of ammonia?

A. Yes.

Q. The sulphuric acid or other material used in manufacture of sulphate of ammonia would be in your opinion therefore charged to certain accounts in Field's Analysis which you cannot identify?

A. Yes.

Q. Are you aware what the duty is upon sulphate of ammonia to this country?

A. I am not, no, sir.

6460 Q. Are you informed as to what the freight charges are from Great Britain to New York City?

A. I am not.

Q. Are you aware that the importation of ammonia sulphate from 1897 to 1904 has increased from 9,905 gross tons to 16,667 gross tons?

A. That is quite possible.

Q. I refer you to the United States tariff for 1897 and ask you if I quote correctly when I state that sulphate of ammonia carries a duty of .3 of a cent per pound.

Mr. MATHEWSON: That is a public statute.

The MASTER: Do not bother to take time on that. Put it in a brief, referring to it as a certain page of a certain statute and I will read it; it is a public act.

Q. You stated in your opinion it would be unwise for the Consolidated Gas Company to market its own ammoniacal liquor or turn it into sulphate of ammonia and market that.

Mr. **Mathewson**: No, he didn't say he thought it was unwise the company should market its own ammoniacal liquor. They do that already.

Mr. **Kirby**: Through a middleman.

Mr. **Mathewson**: They sell to somebody who can use it. It is not used to drink.

Q. And have you ever made an estimate of what the cost of apparatus would be to change your ammoniacal liquor into sulphate of ammonia?

A. No, sir, I have not.

6461 Q. Have you ever compared the cost of manufacture or the estimated cost of manufacture by you with the estimated cost of manufacture by the Barrett Company, to whom you sell your liquor?

A. No, I have made no estimates on the subject whatever.

Q. Have you ever made an estimate of the cost of extracting from your coal tar the percentage of what are commonly known as coal tar products, which are sold for medicinal and other purposes?

A. I have made some estimates of that nature.

Q. And have you ever compared those estimates with the cost of manufacture by the Barrett Company, to whom you sell your coal tar?

A. No, sir.

Q. Now, I refer you to page 6379 of your testimony of yesterday and to Mr. Edgerton's testimony on pages 5024, 5025, 5026, 5027 and 5028. At the bottom of page 6379, you have 775 cubic feet and directly thereunder 225 cubic feet so I take it that the mixture to which you have reference is of those proportions?

A. Yes, sir.

Q. Now, I refer you to Mr. Edgerton's testimony at pages 5024 and 5025 where he gives the cost of a mixture of 775 and 225. You will note at the top of page 5024 that Mr. Edgerton gives the yield per ton of coal of 11,648 cubic feet.

A. Yes, but that is [illegible] the table that I used.

Q. Which table did you use?

A. I used the table wherein it is made to appear that a thousand cubic feet of coal gas of sixteen candle power can be produced for 7.55 cents.

The **Master**: At what page?

The **Witness**: On pages 5026 and 5027.

Q. And such yield was that used by Mr. Edgerton as you will see on page 5028 for a mixture where it was 500 cubic feet of sixteen candle power gas, and 500 cubic feet of 28 candle power gas.

A. Well, I do not see that that makes any difference.

6462 Q. So that in making your comparison you ignored altogether the different yield per ton which Mr. Edgerton used in first using a 14 candle power coal gas and then using a 16 candle power gas?

A. I did not ignore anything that he used. The entire table as it appears on pages 5026 and 5027 is given in my report, in making a combination which I presume I was at liberty to do, I used one of his oil gas results without going into it in detail and got a combined cost. If I had used the other combination it would probably have resulted in a higher combined cost than my comparison shows.

Q. Be that as it may, you did use, in making your calculation, a yield from a ton of coke such as Mr. Edgerton used in getting his 16 candle power coal gas, did you not?

A. Yes. It happens that he claims to get a 16 candle power coal gas out of it. I don't know whether he does or not. We do not. I used that because that practically conforms to our own results.

Q. You really don't know any more about this than that information which you get from the books of the company, do you?

A. We consider that they give a great deal of information on the subject.

Q. Yes, but you have never manufactured any gas yourself?

A. No.

Q. You are not an engineer and you do not pretend to be?

A. No, and I do not pretend to be.

Q. Don't you think that in making up this comparison it would have been a little more in accord with Mr. Edgerton's figures if when you took the proportion of mixtures you had also taken the yield per ton of coal that he used for that mixture, rather than taking the yield per ton of coal that he used for another mixture?

A. I don't think it would make a particle of difference; it would be negligible.

6463 Mr. Mathewson: Mr. Carter states precisely in his table, 10,640, so there can be nothing misleading about it.

The Witness: I stated it because it was our own experience approximately in coal gas production.

Q. Then in making up this table on page 6379 you have used Mr. Edgerton's figures when they were higher than yours and your figures when they were higher than Mr. Edgerton's, and added the two together, or those figures together, to get your result?

A. No, I have used Mr. Edgerton's figures whether they were lower or higher than our own. They happen to be higher in some cases and he gave a reason for it. I accepted his 16 candles because he stated that he got that result with a certain quantity of lime and oxide. His cost is a little more than ours, and I accepted his figures for that reason.

Q. You certainly did not accept his yield, did you?

A. I have his yield figured out. In quantity I used his figures.

Q. You used his figures for a mixture of 500 and 500, where he used them for a mixture of 225 and 775?

A. I don't think it makes a particle of difference; the difference between the two costs was a fraction of a cent. One of his was 7.55 and the other was 7.12; there was a difference of less than half a cent between the two gases in cost.

Q. But a great difference in the details going to make the same up?

A. Well, I think they were of very little importance.

Q. Well, that is your opinion, certainly. We would not expect you to think otherwise, Mr. Carter. Are you not aware in regard to this yield, that by use of modern benches and reducing the 6464 quality of the coal gas to 14 candles that the yield could be increased as high as 5.2 cubic feet per pound, or to the amount which Mr. Edgerton gives on page 5024, 11,648 cubic feet per ton?

A. No, I don't know anything of the sort; I do not believe it, either. And the statement was made that those figures were obtained in our own practice at 14th Street and I have taken every pains and find out that that was not the case.

Q. But other than the results obtained from your practice as you have read them you are in no position to say whether or not that can be obtained?

A. It has never been obtained in our practice, and our practice was cited as the authority for that production.

Q. Not the only authority, if it were so cited. Now, in this statement on page 6379, you have cost of discharging labor and cartage 25.66 cents per ton. I presume you base that on the experience of the Consolidated, don't you?

A. Yes, sir.

Q. And that is based on the cost at the 14th street works where your coal has to be frequently handled, sometimes three times before it reaches the retorts, and at the 42nd street works, where your coal is hoisted and dumped into small carts and pushed by hand labor to your coal storage and again reloaded by hand labor and carted to the retorts where it is again handled into the retorts?

A. The fact is we have to deal with conditions and not theories.

Q. Do you propose to handle your coal in this way at Astoria?

A. I don't understand that Astoria enters into the proposition.

Q. It may or may not. I ask you, do you propose to handle your coal in this way at Astoria?

A. No, we do not.

6465 Mr. Mathewson: And the investment at Astoria is correspondingly greater.

Q. In regard to this yield, I call your attention to a statement in the Progressive Age for August 1, 1906, where it states that the working results now obtained by Dessau & Mariandorf justifying us in fixing the make of gas from standard gas coal with a vertical retort of our system at not less than 12,560 cubic feet per ton.

Mr. Mathewson: Well, really, this has got to be funny, Mr. Master. Here is a German concern with German coal, and a so-called vertical retort, and our process is not mentioned in the advertisements; it is perfectly ridiculous.

Mr. Kirby: It is very funny when Mr. Carter holds himself up to criticize our figures.

Mr. Mathewson: These men are advertisers and produce an advertisement of that character from Germany. It is ridiculous. Vertical retorts were an experiment and are not accepted yet.

The MASTER: Gentlemen, if you will, forbear this discussion and continue with this cross-examination.

Q. In the item of gasmaking, labor and purifying 79.95 cents per ton, which you give as 7.42 cents per thousand cubic feet, I ask you if you are not informed that this service is now being done with modern apparatus and appliances at as low a cost as three cents per thousand?

A. I am not aware of it being done at as low a figure as that, and if it is done at any lower figure, I am not aware to what extent that apparent economy is offset by greater cost of repairs and of fixed charges on the more expensive apparatus. 6466

Q. Now coming to repairs, I asked if even Mr. Edgerton's figure, 3.50 cents, is not lower than that which you charge yourself?

A. It certainly is, yes, sir, and it is lower than we are ever likely to realize with very modern up to date apparatus.

Q. Now is this item of repairs which you have set down at 4.20 and which Mr. Edgerton sets down as 3.50 the same item as set down in repairs in State's Exhibit ZZ, summary of operation for the calendar year ending December 31st, 1905, 14th street, repairs, including labor and material, cost per thousand cubic feet made, 3.85, cost per thousand cubic feet sold 3.95, and in the corresponding items for 42nd street, cost per thousand cubic feet made, 2.53; cost per thousand cubic feet sold, 2.59?

A. No, I do not think the period is the same.

Q. But it is for the same labor and materials?

A. Not for the same labor and materials; it is for the same items of expense, yes.

Q. In your labor of gas making and purifying did you use such salaries as were formerly paid or those which are now paid under the increase, about which Mr. Addicks has testified?

A. Those in actual practice during the period that we are covering by our statistics, Mr. Kirby, in 1905.

Q. Well, some of your statistics such as Complainant's Exhibit 368 run up to January 1st, 1907?

A. Do they? Does that?

Mr. MATHEWSON: No.

The WITNESS: I am not aware of it. It is a misprint if it does. No evidence of it there. The calendar year 1905.

6467 Q. I read that as 1906. I beg your pardon.

Mr. MATHEWSON: You will observe that the first six months as compared with the last six months show the difference.

Q. Can you tell me what the labor items were which went into that calculation of 7.42?

A. What they were in various items of retort house labor.

Q. Yes, gas making and purifying?

A. Yes, sir, I think I can give you that in some detail. Retort house labor 6.61; boiler house .45 cents; purifying house .32 cents.

There is a difference of .04 of a cent which probably arises in the decimal in converting this into tons and back again into cents per thousand.

Q. Do you base your estimate upon any rate of wage?

A. Upon the actual wages paid at that station, Mr. Kirby.

Q. And can you tell me what they are? What labor goes into this gas making?

A. The rate of wages paid at 14th street station is in the testimony somewhere, now I feel very sure. They were brought out before the Gas Commission.

Q. Well, the testimony of the Gas Commission is not altogether before this tribunal?

A. I have not the rates altogether in mind at the moment.

Q. Did you make this estimate up from the rate of wage?

A. No, from the actual expenditures.

Q. You simply took the expenditures for a certain number of cubic feet of gas and divided it by the number of feet made?

A. That is the case.

Q. So that you are not prepared to state to us just what labor was used and how much that labor was paid?

A. I can very easily get you the rate of wages paid at that station during that period.

Q. But you have not the information at hand?

A. No, I have not.

6468 Q. But if that is stated in the testimony before the Gas Commission there has been no change in your calculations?

A. None whatever.

Mr. Mathewson: You mean that you used the rate of wages which prevailed at the time of the testimony taken before the Gas Commission, or don't you remember?

A. No, that prevailed in 1905.

Q. Now, we have here in this statement at page 6379 three items of expense, expense, distribution, distributing expense, amounting in your total to 2.2 cents or over $200,000 per annum, based upon Mr. Edgerton's estimate of over three-quarters coal gas. Is it not true that these three charges are devoted almost exclusively to distributing the gas from one station to another; in other words, for labor and in what you call your exhauster house, or such other labor as may be expended in distributing your gas as you do?

A. Well, part of it, one item of it covers the expense of distributing the gas about the plant and through the holders and through the mains, and the other has to do with the cost of storing that gas at distributing stations and such apparatus as is necessary to be used for that purpose at those points.

Q. And this comprehends the expense of sending or carrying the gas to these points?

A. Yes, sir, that is the case.

Q. And the amount of coke which you use under your retorts in the statement is 32 per cent. of the total coke made. Is not this estimate nearly double that which is used in good practice and about 33 per cent. more than your company uses at its 42nd street works?

A. It may be more than is used at 42nd street, which 6469 would not be significant at all, because at the 42nd street works they have certain drip oil available there as the result of manufacturing oil gas by the retort process, which they are able to use as fuel under their retorts in lieu of coke, so that their apparent yield per ton may be better than at 14th street, where they make no oil gas and have no such residual drip oil to use as fuel.

Q. Is it not a fact that at 42nd street the drip oil is used under the oil gas retorts?

A. Under both.

Q. And you are not prepared to state whether or not, exclusive of the oil used, the coke at 42nd street would be less than 32 per cent. of the total yield?

A. I do not believe that it would, eliminating the drip oil fuel which they have at that station and are able to use under their retorts.

Q. You have never made any computations as to that?

A. No, I have not.

Q. You get a final cost here of 36.22 cents computed upon your figures; is it not a fact that this is about 8 cents greater than the cost to the Central Union?

Mr. Mathewson: The Central Union does not produce any such gas as that.

Q. For the 22 candle power gas that the Central Union produces?

A. Pardon me, I did not catch that question. I was looking for the 36 cents.

Q. My question is whether or not this 36.22 cents, which you set down here as the cost per thousand cubic feet of the mixed gas, which gas we assume, or you assume and which we state, has a candle power of 22 or over, I think it is 23 and something—is not about 8 cents higher than the gas produced at the Central Union works?

6470 A. No, it is not half that much higher. I don't think that under the new candle power law that the Central Union Company is doing such a great deal better than we, perhaps three or four cents better on their mixed gas.

Q. Have you examined the amount of oil per thousand cubic feet which the Central Union uses, have you examined reports giving the amount of oil per thousand cubic feet of gas made?

A. Oh, yes, I have had occasion to do so.

Q. And compared with the results from the works of the Consolidated Company, don't you think that the amount of oil which they used per thousand cubic feet of gas made should be sufficient to give them a candle power equal to that produced at the works of the Consolidated Company?

A. Well, of course the quantity of oil they use in their mixed gas, Mr. Kirby, we cannot very well make any other comparison of any other kind, than between their mixed gas and our combined coal gas, and of course the quantity of oil used per thousand cubic feet of combined gas would vary so much accordingly as the percentage of water gas and the percentage of coal gas is varied, that a comparison would not be very illuminating.

Q. And you have never made any such comparison?

A. I have.

Q. And how much illumination did it give you?

A. Not much.

Q. So that you are not prepared to state one way or the other on that proposition?

A. I made a table and put it in evidence yesterday which I think is quite illuminating. We took the cost of manufacturing gas for the year ending October 31, 1905, and of the gas at the Central Union station and compared it with the combined cost of coal
6471 and water gas made by the Consolidated, and eliminating the
variation due to candle power, found a difference in the two costs of less than one cent.

Q. In that comparison did you take into consideration the relative efficiency of apparatus at the Central Union and at, say, your 21st street works?

A. No, we did not take into account either the advantage they have over—that is, the advantage in cost, as shown in a cost sheet over our coal gas stations, and the fact of their being equipped with more modern regenerative recuperative benches, and with more modern and up to date apparatus for handling coal and handling coke. We did not even take that into account, and even with that advantage there was, as I say, a difference of less than one cent between their cost and ours.

Q. But in making these comparisons you sought in all instances to ascertain such advantages as you thought the Central Union or the Standard, or the New Amsterdam, or the Mutual might have over the Consolidated?

A. When it comes to making an analytical comparison between the costs between two stations, naturally we have got to take into account local conditions. Any comparison other than that would be valueless.

Q. The influences which might make a showing by them more advantageous than a showing by the Consolidated Gas Company were studied by you in the comparisons stated yesterday in the comparisons between the Consolidated Gas Company's cost and the New Amsterdam, and the Mutual and Standard and Central Union?

A. Well, I don't know exactly what you are referring to in my testimony yesterday. I made a comparison between the 14th street coal gas and the Central Union coal gas and made another
6472 comparison between the combined coal and water gas of the
Central Union Company and of the Consolidated Company, and then in reply to some inquiries from Mr. Mathewson I did state what the cost was of the Standard and Mutual companies, in connection with the comparison made by Mr. Edgerton between the Consolidated and the New Amsterdam companies.

Q. And in all of that you naturally sought to ascertain if there were not influences which to your mind might make the cost of production at these stations less than at the Consolidated stations?

A. In referring to the Standard cost I made no analysis of it whatever, or the Mutual. In comparing with the Central Union I did take into account the variations in the conditions at the two stations, 14th street and the Central Union, and in the comparison of the New Amsterdam gas I did take into account, and make note of, certain variations between the conditions there and at ou*t* water gas plants that seemed to me to have a bearing on the subject.

Q. You also stated in your testimony of yesterday that Mr. Edgerton had made an error in his estimate of your losses due to making gas from gas oil in retorts as practiced at 14th Street and 21st Street stations. Is it not a fact that your yield of gas per gallon of oil averages but 50 feet?

A. The yield per gallon of oil used at 21st *for* 14th Street station in 1905 by the Bench process was, as I stated, about 50 cubic feet per gallon.

Q. Is it not a fact that under this condition of yield that 36 per cent. would more nearly represent the loss of drip oil and carbon in the retorts than 33 per cent.?

A. I have no knowledge on the subject and I simply know
6473 the facts to which I testified, that there were no figures that
Mr. Edgerton had opportunity of consulting or which the company has any record of confirming his statement of a production of 33 per cent. of oil tar by the Bench process of making oil gas.

Q. Are you aware what *pre*centage of oil turned into gas 50 feet to the gallon would represent?

A. No, I am not. It would depend a good deal, I presume, upon the grade of gas, whatever that 50 feet might contain in the way of illuminants.

Q. And you are not prepared to state?

A. No, I am not prepared to go into that technically.

Q. In reference to this use of drip oil, is it not a fact that your accounts show particularly at the 21st Street station the use of nearly six times as many pounds of drip oil for heating the retorts to make a thousand feet of oil gas as in use of coke for making a thousand feet of coal gas at the 42d Street works?

A. I should have to confirm that statement before I could testify on it, Mr. Kirby.

Q. You are not prepared to state one way or the other?

A. No, I am not prepared to state at the moment.

Q. It is not a fact that at your 42d Street works you use the coke for firing the retorts but little over eighteen pounds per thousand cubic feet of gas made from coal?

A. I would not like to testify to that from memory.

Q. Yesterday you made a calculation in regard to the New Amsterdam Company whereby you augmented the cost of its gas *pro rata* to the deficiency in candle power compared with the Consolidated Company. Will you state how you made that calculation?

A. It was just simply shown by the comparison of the cost of oil at that time to the two companies, which would figure out, I think, about .57 of a cent for .40 of a candle power.

6474 Q. And what price of oil did you use in your calculation?

A. The price at which oil was used in enriching during that year.

Q. And what was that price?

A. The cost of the New Amsterdam oil was 4 cents, the average cost per gallon and at the Consolidated station 4.08 cents per gallon.

Q. And how much oil did you calculate as necessary to represent the difference in candle power?

A. The amount was not calculated at all. The average cost of the oil per thousand cubic feet used by the Consolidated Gas Company was 18.75 cents and the average cost to the New Amsterdam was 18.18, the difference being .57 of a cent as the cost of oil used, which in round figures would about explain or cover the difference in the candle power between 25.41 candles in the case of the Consolidated and 25 candles in the case of the New Amsterdam Company.

Q. Yes, but this does not take into consideration the difference in the cost of the oil?

A. Of .08 of a cent?

Q. Yes.

A. I think it would.

Q. Did you neglect that altogether?

A. Oh, no. As I have explained, the calculation was not made at all, it was assumed, and I will make a calculation now if you would like to have me.

Q. I don't care what you make now unless it is——

A. I am stating——

Q. I am getting at what you did make.

A. I am stating that the calculation was the average cost per thousand cubic feet of the gas oil used at both points and difference of .57 cents stated as the difference in the value of the candle power produced.

Q. Was this candle power for the water gas alone?

A. Yes.

6475 Q. This would indicate, of course, that the higher the candle power the higher the cost?

A. Yes, I think it would, using the same grade of oil and the same price of oil.

Q. Now, in reference to these candle powers and to the gas war, about which gas war you made reference yesterday, I ask you if it is not a fact that the average quality of the East River gas in 1900 was 28.03 candles, the Consolidated branch one, 24.97 candles; branch two, 23.47 candles; branch three, 26.08 candles; branch four, 24.68 candles; branch six, 24.18 candles; the Mutual, 22.15 candles; the Equitable, 27.83 candles; the Standard, 23.63 candles; the average to the Consolidated being 24.67; and I refer to the report of the Department of Public Lighting and Building for December, 1900, where a table appears on pages 76 and 77, from which I read the figures I just give to you.

Mr. Mathewson: Mr. Carter did not make reference to the candle power yesterday.

Mr. Kirby: But he made reference to the gas war.

The **Witness**: I made no reference to any candle power yesterday. I find those figures reported there in that report.

Q. And it is your information, is it not, that these figures are uncorrected for temperature?

A. That is my information, yes, sir.

Q. Do you know anything about it except you see it in that book?

A. Nothing whatever about it, except what is recorded there.

By Mr. **Kirby**:

Q. Now, you referred yesterday to the condition of
6476 these various plants. Have you visited the 14th street plant
recently?

A. What reference did I make? I would like to know just what you are referring to.

Q. I can find it in the testimony if I search long enough, but it was in regard to their being in good condition, I think in regard to the 111th street plant you stated it was in excellent condition. I have not as a matter of fact gone through this testimony but I have my notes, which I think are fairly accurate in that regard.

Mr. **Mathewson**: He stated that the 111th street plant was in operation and that it was not all taken by the city.

Mr. **Kirby**: Yes, and he said more than that, too.

Mr. **Mathewson**: Quite likely. At page 6303 he refers to the 111th street plant:

"No, it has never been abandoned. Besides being operated as a distributing station it is held in a reserve capacity, the manufacturing apparatus being in excellent condition, some of it never having been used."

That, I suppose, is what you refer to.

Mr. **Kirby**: Yes, and I think he will find in another part of the testimony he made reference to the plant. If you will refer to page 6377 you will note in reference to the 14th street plant:

"Q. What have you to say to Mr. Edgerton's statement that the 14th street plant is a dilapidated old plant. A. Well, there has been nearly a million dollars expended on keeping that plant in repairs since 1884, and as I testified this morning, the capacity of the plant has been greatly increased, and the cost of manufacturing gas
there has been greatly reduced, so in every respect the stand-
6477 ard of efficiency is maintained at the plant and the capacity
considerably augmented."

Q. Now, I ask you when you visited the 14th street plant last?

A. I have visited it on and off a number of times in the last twenty years. I suppose*d* it may be a year since I was at the plant.

Q. Did you take any special notice of the retort house walls?

A. Not specially, having no occasion to do so at the time. I think if they had been in a very dilapidated condition I should have taken notice of them.

Q. Did you notice whether the buildings were in a complete state of repair?

A. To all appearances they were.

Q. Did you notice whether the walls were in alignment or not?

Mr. MATHEWSON: The walls of the building or around the property?

Mr. KIRBY: Well, we will take them both.

A. I did not notice that they were not.

Q. Did you notice whether they were or not, did you pay any particular attention to it, did you look to see?

A. Only in the most casual way.

Q. You have also been to the 42nd street works I assume?

A. Yes, sir.

Q. Did you notice the state of the timber trestle work there?

A. The timber trestle work there is something valued at a very low figure, I think, by Mr. Mayer, and it is answering its purpose at the present time, and I do not think that that work is ever very attractive looking.

Q. Well, was it in good condition?

A. I believe it to be.

6478 Q. In a thorough state of preservation and repair?

A. It certainly is kept up and repaired; otherwise it could not be operated.

Q. At the 42nd street station did you notice the state of the coal shed which is valued at $59,000?

A. I noticed the condition of the coal shed.

Q. Well, what condition was it in?

A. Nothing about it that attracted my attention.

Q. Nothing in respect to any of these buildings that attracted your particular attention, was there?

A. Not at all, of a character which would answer the description given by some of the witnesses for the defendants.

Q. Well, that depends on what you call dilapidated, does it not?

A. Well, I presume that might be a flexible term.

Q. Taking 111th street station which you state has apparatus which is in excellent condition, what apparatus is there?

A. Benches, retorts—I am not particularly familiar with with the apparatus; I have not qualified, nor have I attempted to qualify as an engineer, but I am informed by the engineering department that the apparatus is in the condition I have described it.

Q. But you do not know of your own knowledge?

A. So far as the technical status of the apparatus is concerned I should have to depend upon the engineering department for information regarding it.

Q. Have you been at the station recently?

A. Within a year.

Q. Did you notice the condition of the retort house roof?

A. I had no particular occasion to do so, and saw nothing particularly the matter with it.

Q. Do you know whether that roof is such as would keep out the weather?

6479 A. I have every reason to believe that it would. I have no information to the contrary.

Q. Is there any roof there?

A. On the retort house at 111th street?

Q. Yes.

A. There was the last time I was there.

Q. Was the entire roof there?

A. It was, the last time I had occasion to visit the plant, all there.

Q. A year ago?

A. Yes, sir.

Q. And you don't know what condition it may be in to-day or a month ago?

A. It might have been struck by lightning or demolished or taken down since them for aught I know to the contrary.

Q. Then as a matter of fact you know very little about the condition of the 111th street plant of your own knowledge?

A. Well, I have every reason to believe it is in good condition.

Q. And you so believe because somebody told you so?

A. Because it is our practice to keep our plants in that condition.

Mr. MATHEWSON: And because the last time he saw it it seemed to be.

Mr. KIRBY: But he has not seen it except over a year ago.

The WITNESS: I have no reason to believe that it has undergone any radical change in its conditions since I was last there and I do not believe it has.

Q. What kind of apparatus is at 111th street station?

A. Well, I am trusting to memory and speaking from the standpoint of a layman entirely; it is a coal gas apparatus.

Q. Is there any purifying apparatus there?

A. My impression is that there is. I would not be sure of it.

6480 Q. And if that plant were started up to-day, do you consider that it could produce purifying gas and get it into such condition that it could be sent out from that plant to the consumer?

A. I have no idea that the plant could be started up to-day, nor any plant that has been out of commission for some time, started up within twenty-four hours.

Q. What should have to be done to that plant before it could be started up?

A. Whatever is lacking in the way of apparatus would have to be provided.

Q. So that it is not a complete manufacturing plant as it stands to-day?

A. I understand not complete.

Q. I suppose in reference to coke that you have no further information than that that has been given by Mr. Addicks and Mr. Doane, have you?

A. I do not believe that I have, except that I do not believe that we will be able to increase the production of it 200 per cent. and at the same time double the selling price of it. I don't know that either of them may have expressed that opinion, but it is mine.

By Mr. Mathewson:

Q. Is that the result of Mr. Edgerton's assumption?
A. As suggested by Mr. Edgerton in his hypothetical cost.

By Mr. Kirby:

Q. We quite understand that you do not agree with Mr. Edgerton's conclusions. I do not think we need emphasize that in any way. I presume that this comparison that you have made with the New Amsterdam and Mutual, Standard and Central Union
6481 was upon information furnished to you by others, was it not?
A. The question is based upon facts as set forth in their statement of operations to which I have access.

By Mr. Mathewson:

Q. And the same reports to the Gas Commission which Mr. Edgerton used?
A. The same reports.

By Mr. Kirby:

Q. And all your information has been taken from testimony which appeared before the Gas Commission?
A. Well, I think it has, I think all of it is in evidence.
Q. No information other than that which appears in the testimony before the Gas Commission has been used by you in making the comparison spoken of put in yesterday?
A. I would not say, I might have used some calendar year figures, I am not sure about it. In which case I do not think any calendar year figures were submitted to the Gas Commission.
Q. And if so, you got your information from these companies or officers thereof?
A. Yes.

By Mr. Mathewson:

Q. If you used calendar year or nominal year you stated it in each case?
A. Yes, it is always plainly stated.

By Mr. Kirby:

Q. You have stated that Rowland in his inventory of 1884 did not include the foundations, that it was not his rule to do so.
6482 That in some buildings he might have. Now, I ask you how you have come to that conclusion, what knowledge have you of what Mr. Rowland's custom was?

Mr. Mathewson: Will you repeat that question?
(Question repeated.)
Mr. Mathewson: Foundations of apparatus in every case.
Mr. Kirby: Foundations of apparatus I have reference to.
Mr. Mathewson: I meant in the cost of buildings, that was my question.

A. Answering your question as amended by Mr. Mathewson, I will say, that what information I have on the subject is gathered from looking over his appraisals.

Q. The appraisals which are in evidence in this case?

A. Yes, sir.

Q. You have made some reference to screenings from coke, in which you said that 21 per cent. of the screenings were sold and five per cent. of the screenings were used. I would like to know where you got that information?

A. I stated that of the coke used at the water gas stations five per cent. was screenings, and of the coke sold, accepting your figures, 21 per cent. was screenings.

Q. Now, I ask where that information came from?

A. The information appears in Exhibit J, I think, State's Exhibit J in this case.

Mr. Mathewson: Are you sure about the number?

6483 The Witness: Yes, it is State's Exhibit J, page 414-A of the exhibits in this case.

Q. Do you know the method of charging your water gas apparatus with coke when such is used and how screenings are used when such is done?

A. Do I know the method of charging the apparatus?

Q. Yes.

A. Do you mean the physical charging of the apparatus?

Q. Yes.

A. No, I don't know much about that.

Q. Do you know whether or not it is customary to place screenings on the outside edges of the coke between the main body of the coke and the apparatus?

A. Oh, I think not. I think that nothing of that sort is done. In fact, I think there is scarcely any screenings used at all in the generators in the water gas plant.

Q. On page 6334 of your testimony of yesterday there was a certain criticism of Professor Bemis' statement and Mr. Mathewson questioned you, and he stated:

"What percentage of the high-grade oil was used? 16 per cent. of the high-grade oil. As a matter of fact, what proportion of oil was used? A. 25 per cent., slightly over."

I ask where you get your information that twenty-five per cent. was used and not sixteen?

A. From our books.

Q. And where does that appear, in any exhibit in evidence here?

A. I don't think that it would be shown by the evidence.

Q. I refer you to the matter of Schmitt Bros.' bill, of which you spoke yesterday, to the amount of the actual cost of which you added ten per cent. If I remember correctly you stated that was to cover certain other work which you had to do in addition to the
6484 actual putting in of the apparatus. Will you kindly tell me just what you did do there, and for what that ten per cent. charge was?

A. The time employed in going to the customers' premises and finding out what was required, making a drawing of it, taking the matter up with Schmitt, arranging to have the work done, and the price to be paid for it, and inspecting the work when completed; those would be the main things.

Q. What was the work?

A. What was the character of the work they did?

Q. Yes.

A. I think in every instance the installation of Manhattan heaters or some gas heating appliances.

Q. A gas stove?

A. It is not a gas stove exactly, it is a heater that sets into the fireplace and requires some special piping and masonry work and that sort of thing.

Q. And did you do the piping and masonry work?

A. No, we did not do any of it.

Q. And what work did you actually do?

A. I have described it; we put the time in going to the customers' premises, probably explaining to him the work that it would be necessary to do in making such an installation and making a diagram of it for Schmitt's use, indicating how the work should be done and taking it up with Schmitt and arranging with him for the cost of it, and inspecting the completed work.

Q. And it is the custom of your company to charge its customers for such services as you have just made reference to?

A. In the case of this particular kind it is the custom.

Q. Wherein did this differ from others? You have done work for Schmitt before?

A. No, this work was not done for Schmitt, but Schmitt has done a good deal of work of that character where no addition was
6485 made to his bill whatever, where it was not necessary for us to do any specific work.

Q. Had you ever installed any apparatus, gas ranges, or heaters or what not in the place where this heater was put in before?

A. I don't know whether we had or not.

Q. This is what you consider an unusual case?

A. They were quite unusual. I do not think there were six cases that occurred in 1905.

Q. And the amount received appears to a credit to what account?

A. To the account to which the expense of whatever nature the company was put to, would be charged the distribution account.

Q. And what is the name of that account as it appears in Exhibit 94?

A. Distribution account. It would appear under the subdivision of distribution material, the credit.

Q. Yesterday you made some reference to Mr. Edgerton's testimony, giving the cubic feet of gas delivered in Chicago. Are you familiar with the amount of gas turned into Chicago prior to the years 1904 and 1905?

A. No, sir.

Q. Are you acquainted with the operation of sending gas into Chicago from the Indian natural gas fields? Do you know the maximum amount which has ever been sent in?

A. No, nothing in the testimony about it; the only thing in the testimony in regard to the Chicago output of gas is that it is about fifty-five million feet per day on the average, or the maximum is that which I could scarcely reconcile with the statement that 168,000,000 feet of natural gas were pumped daily into Chicago.

Q. The number of cubic feet which Mr. Edgerton intended to state, and I believe did state, was not 168,000,000 but 68,000,000, and I so have it in my notes. 6486

A. It appears twice in the answer. That is the reason propably why it seemed to me not to be a typographical error.

Mr. **Mathewson**: Even that would be sufficiently improbable, for our purposes.

The **Witness**: Quite. It would seem to me they were not making any gas there at all and were wasting 13,000,000 a day.

Q. And you have taken the output for a certain year, whereas Mr. Edgerton had reference to an entirely different period. This morning you spoke in reference to candle power of the gas furnished in Milwaukee, Grand Rapids and Detroit, and made a certain deduction of cost therefrom. Did you know or do you know the price of oil as used in Milwaukee, Grand Rapids, and Detroit?

A. No, sir.

Q. Did you base your reckoning upon the price of oil as used for the Consolidated Company?

A. No, sir.

Q. What did you base your calculations upon?

A. I based my calculation upon the assumption that the consumer is buying illumination. It is called gas and measured as such, but the consumer is buying illumination expressed in candle power, and if he pays 84 and a fraction cents for candle power of only 69% of the value of the candle power in New York he is paying at the rate of $1.23 for a corresponding candle power to that which is furnished in New York.

Q. How did you arrive at the conclusion that the relative value was 69%

A. By taking the average candle power delivered in New York as shown by city tests and taking the candle power furnished by Mr. McMillan, or at least as produced in the three cities where his companies operate, and allowing a drop of one candle between his stations at his district. 6487

Q. Yes, and then what?

A. Applying the two factors of the candle power delivered at the district in New York and delivered at the district in Detroit, Milwaukee and Grand Rapids I got 69%.

Q. I still do not understand. You assume that the candle power as given by Mr. McMillan was a certain definite amount.

Mr. **Mathewson**: He stated it.

The **Witness**: 17.8, and reducing it one candle power, 16.8.

Q. Very good. We will say 16.8; and what price per thousand did you put on that gas?

A. 84 cents and a fraction. I can give it to you exactly.

Q. Averaging it for the three cities?

A. Averaging it for the three cities.

Q. Now we increased that candle power to how much?

A. 24 and a fraction, the candle power delivered in New York.

Q. That is the candle power delivered to the consumer?

A. Delivered to the consumer.

Q. And that gives you a difference of how much candle power?

A. The difference between 69% and 100%, figuring it in percentage.

Q. And did you figure that increased cost per candle at the same rate as the cost per candle for 17.8 candle?

A. The calculation was based upon the variation in the candle power and the actual price paid by the consumers of the McMillan Company for the gas which they received of 16.8 candles.

6488 Q. They paid 84.95 cents per thousand cubic feet of 16.8 candles?

A. That is the case.

Q. Assumed by you?

A. Exactly.

Q. Now, will you take a piece of paper and show me the figures that would produce the cost that you have stated?

A. You want to know the arithmetical proposition?

Q. I want to see just how you figure it out, step by step, figure by figure?

A. It is a very simple proposition indeed; 84.95 cents represents the price paid by the consumers of the McMillan Company for the gas furnished them. The value of the gas as an illuminant represents 69 per cent. of the value of the gas supplied to the consumers in the City of New York.

Q. That is the percentage 17.8 upon 24?

A. 16.8 upon 24; that is the case And by dividing 84.95 cents by .69 you get the equivalent cost of gas of the candle power delivered in New York.

Q. Of course you have no knowledge as to what kind of gas this is which Mr. McMillan's companies are selling?

A. No, other than the information conveyed in his testimony, Mr. Kirby.

Q. In reference to Mr. Doane's price of coke, what you really mean is that the purchaser does not pay the cost of deliverey of the coke?

A. It is included in the amount that he pays, Mr. Kirby, for coke.

Q. He does not pay it in addition to the price per ton or unit which he buys?

A. No, sir.

Q. I refer you to Complainant's Exhibit 368, candle power, the calendar year 1905, monthly averages, and ask where you obtained that information?

A. That information is obtained from two sources: Our own station record and the record of the tests made by the city which

6489 are kept in the Department of Water Supply, Gas and Electricity.

Q. Do you know whether or not these candle power tests were corrected for temperatures and pressures?

A. Prior to July, 1905, they were corrected for candle weight and consumption only; subsequently to July 1, 1905, they were corrected for candle weight consumption for temperatures and for pressure.

Q. What was the candle power standard at this time?

A. Are you asking——

Q. The candle power standard, the requirements of the statute?

A. What were the legal requirements?

Q. Yes.

A. My understanding is that prior to July 1st the requirements were 20 candles delivered on the district and subsequently to July 1st, 22 candles delivered on the district.

Q. And the average you gave in answer to Mr. Mathewson's question was for the entire twelve months including that period covered by the 20 candle power regulation?

A. That was the case.

Q. Yesterday you spoke of the competition of the electric current, of the lack of suburbs within which the Consolidated Company might operate and of other causes which you had in mind which tended to refute Mr. Marks' prediction as to the increasing sale of gas; you also spoke of the transient and shifting residents of the city and their effect upon payment of their gas bills and consequent loss to the company; also referred to an article in the New York *Times* of January 1st, 1907. Now I refer you to an article in the New York *Times* of January 28th, 1907, and will read it and ask if you can inform me whether or not the statements therein are true as they apply to the Consolidated Gas Company.

6490 Mr. MATHEWSON: Let us see what it is before you read it.

Mr. KIRBY: I think you have probably seen it (handing a newspaper clipping to Mr. Mathewson).

Mr. MATHEWSON: I do not think I have, if it is the New York *Times*. I think I shall object to the reading of that statement, Mr. Master. It seems to me it is utterly impertinent in any respect, a newspaper assumption, reports and conclusions, unfounded largely, I know.

Mr. KIRBY: Even so the witness can state it, as he has taken occasion to refer to newspaper clippings. He has taken occasion to state that the sales are not increasing.

The MASTER: What is the page where he spoke of newspaper clippings?

Mr. MATHEWSON: It depends somewhat on the purpose and point upon which it is offered. The question which the witness was dealing with was brought up by the defendant's assertion as to our bad debts and deposits, and he simply stated that there was great pressure to bear even to make us return part of our deposits that we had, and that a bill had been introduced in the Legislature for that purpose. That is entirely pertinent, but this newspaper article that you have here——

The MASTER: Unless it is directly applicable to something brought out yesterday I will exclude it. You may equally read in everything that has appeared in the newspa-*res* for six months about gas companies and ask him what his opinion is about all that.

Mr **Kirby**: On page 6351 you will find a qu-stion by Mr.
6491 Mathewson:

"Q. Even so, isn't it a fact that bills were introduced in the Legislature to compel us to return our deposit? A. There have been such bills introduced and I notice in The New York *Times* of January 21, 1907, there is reported a bill introduced by Assemblyman Eagleton reducing the amount of deposit the company can charge to the amount of one month.

Mr. **Burr**: That is entirely improper."

The **Master**: Possibly it was. It was not objected to when the question was asked. This question is. I will exclude it.

Mr. **Kirby**: Exception.

Q. Mr. Carter, is it or is it not a fact that your sales for the year ending December 31, 1905, have increased to fifteen billion feet of gas?

A. Our sales for the year 1995 are in evidence, Mr. Kirby.

Q. 1906, I beg your pardon.

Mr. **Mathewson**: Mr. Master, the testimony which it is now sought to introduce of subsequent periods of course would be met, if it were pertinent at this stage of the case, by evidence as to the increase in our plant for the same period and other things, and open up an entirely new field of additional capital and other points which you can see would be entirely pertinent in that connection. This is not cross-examination and it is certainly not pertinent at this stage of the case. I object to it on all those grounds.

Mr. **Kirby**: Mr. Carter has stated that the sales of the Consolidated Gas Company were not increased in the way Mr. Marks' pointed out, and I should think it were certainly pertinent to show by
6492 what amount they had increased.

Mr. **Burr**: May I say here, as it appears on page 6296 of the record, Mr. Carter sets himself up as an expert to contradict and criticize the theory upon which Professor Marks arrived at the conclusion that as the gas is reduced in price it increases in consumption. Now, whether as a matter of fact in his own company there has been an increase in the sales of gas, in the consumption of gas, for the past year, is quite a pertinent question, it seems to me.

Mr. **Mathewson**: Well, if you want to ask him whether that is so, and the Master——

Mr. **Burr**: Mr. Carter says——

The **Master**: I have it before me, but I do not see how this question has anything to do with cross-examination as to that. I should doubt very much if it was legitimate cross-examination even if it appeared here that there had been any such decrease in the price of gas during the last year to a fixed amount as there was during this period as to which Mr. Carter was testifying, but certainly the conditions existing during the last year when some people were paying one dollar and some people paying 80 cents would not afford any criterion to go by. I do not think that is proper cross-examination.

Mr. **Burr**: I think to disprove his own assertion we are entitled to show just what happened in his own company.

The **Master**: I do not see that it tends to disprove it. And even if it does I do not know that it is a proper time in the case to bring it in. It is not cross-examination, in my view, and that is
6493 what we are here for now.

Mr. **Mathewson**: I am merely seeking to curtail this within some limits.

Mr. **Kirby**: Do I understand that the Master will not take judicial notice of the amount on deposit in the Federal court, representing the twenty cent deposit from the dollar collected by the Consolidated Gas Company?

The **Master**: You want to know if I know what it is? I will tell you, yes.

Mr. **Kirby**: I ask if the Master will take judicial notice of such?

The **Master**: No, I could not take judicial notice of it, Mr. Kirby.

Mr. **Kirby**: Then I ask——

The **Master**: But the Court will, undoubtedly. It may change between now and the time when this case comes before the Court. It will if you don't hurry up and proceed with your cross-examination.

Mr. **Kirby**: I ask the witness if as a matter of fact there has not been deposited in the Federal Court since May 1st last, to January 1st, 1907, the sum of $1,904,417 representing the difference between one dollar per thousand feet of gas, the price charged by the company, and eighty cents, the price fixed by the law the constitutionality of which is now being tried.

Mr. **Mathewson**: Same objection.

The **Master**: I will exclude it.

Mr. **Kirby**: Exception. I do not want to unnecessarily open up this field, Mr. Master, but I think under the circumstances the witness should be permitted to answer.

6494 The **Master**: Well, he may answer it. It has been ruled on. You can take his answer under the rule, if he knows.

The **Witness**: I presume you are asking if that is the amount deposited by the Consolidated Gas Company?

Q. Yes?

A. It is not.

Q. Can you state the amount which has been deposited by the Consolidated Gas Company.

Same objection, same ruling; exception.

A. I cannot state from memory the amount. It is very much less than that.

Q. It is less by the difference between the total amount deposited and the amounts deposited by companies other than the Consolidated Gas Company?

Same objection, same ruling; exception.

A. That is the case.

Q. Can you state the number of cubic feet sold by the Consolidated Gas Company during the year 1906?

Same objection, same ruling; exception.

A. I cannot.

Mr. **Kirby**: That is all I have, Mr. Master.
The **Master**: All right, proceed, Mr. Burr.

Cross-examination by Mr. **Burr**:

6495 Q. Well, of course, you have made some inquiries t ..ent
certain what the result has been, whether there has be now-
reduction in the price of gas, before you ventured to offer an Had
ion as you expressed it here on page 6296? have

A. Whether there has been a reduction in the price of gas where, when and to whom?

Q. You say on page 6296:

"In other words, any advantage resulting from a substantial decrease in price of gas, we already have to the fullest extent, and any increase we might realize in population is likely to be entirely, if not more than, absorbed by the development of the electric business."

A. That is my opinion, yes, sir.

Q. I say, you have made some investigations to support that opinion?

A. Why, yes, sir. It is supported by the testimony I have just given with respect to the McMillan's companies where gas is selling at eighty-four cents and they do not begin to burn as much as they do in New York City.

Q. Are you acquainted with the fact that the People's Gas Company in Chicago reduced its rate here some little while ago?

Mr. **Mathewson**: That was gone into long ago.

Mr. **Burr**: Yes. Well, it is not denied that it reduced its rate, I want to ask him if he recalls or if he knows that that company has increased its dividends since that time?

A. No, I am not aware that it has. I believe it has restored them to the former figure, with respect to one dividend. I don't know that that means they are going to continue paying at the rate they formerly paid.

6496 By Mr. **Mathewson**:

Q. One quarterly dividend?
A. One quarterly dividend.

By Mr. **Burr**:

Q. I find in the New York *Times* of January 26th, this year, a statement that "The directors of the Peoples Gas Company declared yesterday a quarterly dividend of one and one-half per cent., increasing the annual rate from five to six per cent. This restores the company's dividends to the figures at which they stood for nine years prior to February last year, when the rate was reduced one per cent. to five per cent. for the reason, as was explained at the time of the reduction, that the directors felt that prudence required this step in view of the reduction in the price of gas. It is reported in Wall Street"——

Mr. **Mathewson**: It seems to me enough of that newspaper article has been rea[illegible] hen we get to what is reported in Wall Street we ought to stop.

The MASTER: I think so, Mr. Burr.

Q. Have you any information on that subject?

A. None. I should not assume from that article that the rate of annual dividend has been restored at all. I should expect that they might possibly not pay the same dividend the next quarter.

Q. But you have no information which would lead you to disbelieve this statement as it appears here in the public press?

6497 A. I believe that they paid at the rate of six per cent. for this quarterly dividend, yes. That I can believe from that article.

Q. Now, you are not a gas engineer, I think you stated?

A. Oh, I have said that several times, I think.

Q. You never built a gas works?

A. No, sir.

Q. You never operated a gas works?

A. No, sir.

Q. You have no idea of assuming to pose here as an expert upon any branch of the gas business outside of the financial department?

A. That is the case.

Q. Now, you have criticised the report of Messrs. Marwick & Mitchell, Mr. Carter, in some respects. You said that according to their report the amount of gas on hand January 1, 1905, is incorrect.

A. Yes, sir.

Q. You were asked by Mr. Mathewson (page 6336), referring to Mr. Hall and his report, "Is the amount which he states on hand in the holders January 1, 1905, 26,552,000 cubic feet correct? A. No, sir, it is not correct." Is there any such figure as that in Mr. Hall's report or Marwick, Mitchell & Company's report?

A. Yes, sir. On page 1433 of the record of exhibits appears the statement that the gas in the holder on January 1, 1905, amounted to 26,552,000. The record on page 6336 of the testimony has three ciphers too many. It is a stenographic error. The figures are Mr. Hall's, and they are incorrect, and they are your figures so far as the testimony is concerned, Mr. Mathewson.

Mr. MATHEWSON: I repudiate the last three ciphers on page 6336. They are not mine, but the stenographer's.

6498 Q. The figures should be 26,552,000?

A. Yes, sir.

Q. That is the way it appears in the accountant's report?

A. Yes, and I understood Mr. Mathewson, and I think Mr. Mathewson said 26,552,000, and I said "No, sir it is not correct." And I reiterate that 26,552,000 is not correct.

Q. That is what I want to get at? What is the correct figure?

A. The correct figure? The correct amount was 27,880,000 cubic feet of gas in the holders January 1, 1905.

Q. You say you had certain gas on hand at the 18th street station. Now, why didn't you inform Mr. Hall as to that?

Mr. MATHEWSON: We didn't know what he was getting up; he didn't ask for any figures at the 18th street station. He could have had the books.

A. I didn't know Mr. Hall was using gas on hand at all. I understood he was checking up Exhibit 94. There was no statement appearing in Exhibit 94 of gas on hand and I had no means of knowing what he was doing independently of checking Exhibit 94. Had he asked for a statement of the gas on hand I should certainly have seen he got every figure we had on the subject.

Q. Didn't Mr. Hall ask you for the station records?

A. He asked for the manufacturing records so as to check Exhibit 94, and he had and was enabled to check the exhibit in its entirety.

Q. Didn't you give him the station record for 14th street, 21st street, 44th street, 99th street?

A. I did. They are all manufacturing stations and were used by him in confirming our statements in Exhibit 94 of the employment of material entering into the manufacture of gas. 6499

Q. You didn't give him 18th street?

A. 18th street is not a manufacturing station and we did not give it to him because there were no manufacturing figures contained in it.

Q. Assuming you are correct in stating that the quantity on hand on January 1, 1905, would be more than that shown by the accountants, it would have had the effect of increasing the amount of leakage, would it not?

A. No, it would not, assuming that a corresponding quantity was on hand at the end of the year of which Mr. Hall did not take cognizance.

Q. With a greater output of gas there is a greater percentage of leakage, is there not?

A. We are not dealing with output in your question. We are dealing with quantity on hand, which has no effect on the output unless diminished as a result of a month's or a year's transactions.

—. Well, this error would not in any way affect the computation of gas per thousand feet, would it?

A. Assuming he used the sales as recorded in your statements where he used the sales less the lamp sales reaching an arbitrary factor, I don't know that it would have affected; where he made any addition to his cost on account of unaccounted-for leakage therein he would be in error.

Q. The extra gas on hand January 1, 1905, added to the leakage at the close of the year would not increase it to any great extent, would it?

A. No, it would not result in any material change in his figures, Mr. Burr.

Q. Assuming that your 18th Street station holders on January 1, 1905, were full and their capacity was I believe not more at any time than 5,500,000 cubic feet, what difference in cents per thousand cubic feet according to Mr. Hall's method of computation would it make? 6500

A. I don't know. In the first place the assumption that the holders were full would scarcely go because these records are taken at 7 A. M., after most of the gas in the holders has been taken out, I think, so it would not be the maximum capacity of the holder that would be recorded as on hand at that time.

Q. Assuming it be just as I said, it would be .01 cents per thousand, would it not?

A. Well, I am willing to assume that, Mr. Burr.

Q. Now, as a matter of fact you had only about one million cubic feet on hand at 18th Street, had you not?

A. Exactly 1,328,000 on hand at 18th Street on the first of January, 1905.

Q. On that basis the error in computation could be neglected and not affect the ultimate result?

A. I presume any one could neglect it who chose to do so.

Q. I mean to say it would not affect the ultimate result?

A. Not substantially.

Q. You said yesterday you had approximately the same stock on hand at 18th Street at the close of 1905 as you had at the beginning of the year——

A. I don't remember saying so. I would like to have it pointed out.

Mr. Mathewson: I asked you no such question.

The Witness: I made no such statement.

Q. All right, I will refer you to the page later. You said in reference to Mr. Hall's evidence as recorded on page 4477—you referred to that testimony and quoted his as stating that your sales for five months, June to October, exceeded your manufacture and purchases by 421,516,256 cubic feet; do you recall that?

A. Yes, sir.

6501 Q. It did not occur to you when checking Mr. Hall's figures that he simply made an error in recording his figures shown in Exhibit B?

A. I knew he had made an error. I so stated that he had made an error.

Q. Didn't you find that that error was in the question proposed to him by Mr. Mathewson?

A. No, sir. It was not proposed to him by Mr. Mathewson. It was proposed to him by you.

Q. Was it?

A. Yes, sir.

Mr. Burr: That accounts for it.

Q. Well, it was quite apparent that the slip had been made by the witness or by counsel.

A. Why, very apparent, I think.

Q. Again referring to Exhibit B, is it not true that the only actual stocks entered were those of January 1, 1905, and December 31, 1905, the other stocks or those entered as such being only balancing figures.

A. They are certainly not quantities on hand, and I so testified.

Q. So that it would appear, would it not, July 31, 1905, you had over-delivered gas beyond your make, amounting to 197,808,540 cubic feet, plus the unmetered gas at the same date and what was metered in gas?

A. I don't know. I would not like to testify to anything from those figures. They are not the kind of figures that are ever made up in any gas statement and I prefer not to draw any conclusions from them at all.

Q. You stated yesterday in regard to advertising expenses, it was obvious to you that Marwick, Mitchell & Company had treated $15,528.57 as a deduction twice?

A. Yes, sir.

Q. Were you able to trace the individual items making up 6502 the several deductions made by the accountants?

A. Only with respect to that item. With respect to that item I did, and read it into the testimony.

Q. Have you got the figures there?

The Master: Referring now to page 6342?

Mr. Burr: Yes, sir.

A. The individual items are given on pages 1462 and 1463 of the exhibit book.

Q. I will ask this question, the item on page 1432, "Legislative and Franchise Litigation" and so forth, .61 of a cent per thousand cubic feet is made up as follows, is it not:

Expense, general office	.19
Advertising——	

A. Where is .19 of a cent?

Q. Expenses, general office, .19.

A. Where is it to be found?

—. Page 1437 of exhibits.

A. There is such an item as .19 on the page.

Q. Advertising and legal, .48 of a cent; total, .67. You have in the divisor accounts .06, as per page 1432, total .61.

A. Well, I could not possibly confirm that statement. There were a number of items appearing on page 1437 as being rejected and not shown in the table on page 1432, of which amount I understand was this .19 of a cent.

Q. Now that I have called it to your attention does that explain what you consider an error on the part of the accountant?

A. No, it does not.

Q. Are you satisfied they were correct in the deductions made?

A. No, I am not.

Q. Well, can you state the account which you considered to be duplicated?

A. Yes, sir.

6503 Q. Please do so.

A. On pages 1462, 1463, appear in detail the items rejected by Marwick & Mitchell as follows:

Amount of ordinary legal expenses charged up exceeding amount of actual payments	$7,705.38
Actual payments excluded	15,528.57
Legal expense on account of legislative investigation	28,876.60
Franchise litigation	5,270.76
Advertising	6,020.34
Total	$63,401.65
If you add to that	15,528.57
A second time, being the second item,	
you get a total of	$78,930.22

And if you divide that amount by 13,012,384,000 cubic feet, the factor which they use in arriving at their rate per thousand, you get the cost per thousand of .61 which they used, and stated to be the amount which they rejected.

Q. What particular item was duplicated?

A. The item of $15,528.57.

Q. How do you know that?

A. Because the calculation demonstrates it very quickly to my way of thinking.

Q. Does not the calculation to which I have just called your attention explain it?

A. It does not explain anything. There is a large element in there that is not any rate per thousand of any kind. I am asked to take 19 cents, deduct 6 from it and add that to something else and reach the .61 of a cent, but I would not be satisfied to accept that as an explanation of that amount. I might indeed say that is not the only item on page 1437 that is not accounted for in this table 6504 on page 1432, but there are several other items which are also omitted from that page.

Q. Well, dropping that for the moment. In dealing with the street lamp expenses, the accountants eliminated both the sales and the amount of the expense, did they not?

A. They eliminated not the sales, because they had nothing to do with the sales, they eliminated the item of maintenance, but they did not eliminate the cost of the gas which was supplied to the lamps from the operating expenses, and therefore they could not properly eliminate the quantity of gas that was supplied to public lamps from their computations.

Q. What do you consider is the right method of treating that question?

A. As we treat it.

Q. That is by eliminating nothing?

A. Showing it as an expense as it is an expense, and showing in the income the total amount received from the city as long as the amount that we receive from the city is not divided by the contract between gas and maintenance.

Q. I understand that you testified heretofore that it was merely a matter of bookkeeping. You charge up against the cost of gas and say that it is merely a bookkeeping regulation. Isn't that the explanation you have of it?

A. No, it seems to me an original method of dealing with it. I will explain that in all our computations of cost, of profit and so forth, we show that item on both sides, so that the net result is identically the same as though it were deducted from the expense and the expenses shown as something that they are not.

Q. To ascertain the cost to the private consumer that item should be eliminated from both sides, should it not?

A. Our business deals with private and public consumers
6505 and all kinds of consumers and it is a business that has to do with consumers as a unit and we cannot split it up into different kinds of business; it is all the gas business.

Q. Have you reduced the number of transients to whom you made reference, to a given percentage in the City of New York?

A. No, sir.

Q. Did you ever make an examination of a going concern on behalf of a buyer, Mr. Carter?

A. Well, what do you mean by that question, please?

Q. Well, one might take a different view of the valuation under those conditions, and I ask you whether you had any experience in placing a valuation upon a going concern for a person who was a proposed purchaser of that going concern?

A. Why, do you mean as a purchase of property, in the purchase of a plant?

Q. Yes, a going manufacturing plant?

A. No, I don't think I ever have. I don't recall an instance just now of just that character.

Q. If you were called upon so to do would you consider expenses similar to legislative expenses that have been referred to here, expenses in the ordinary course of a company's business?

A. I should expect if I were figuring on what profit I could make out of an enterprise that I contemplated investing in I should certainly consider those expenses as something I should have to reckon with in the future.

Q. Would you not treat them as expenses of an extraordinary nature and more properly chargeable to surplus account?

A. No, nothing is chargeable to surplus account, except through the operating expense account.

Q. Isn't that the recognized method of treating such expenditures?

A. It is absolutely not the recognized method.

6506 Q. And you base that statement upon what experience outside of the Consolidated Gas Company?

A. My observation of systems of accounting generally.

Q. Your attention has been drawn to companies having such items of expenses, legislative expense?

A. Yes, sir.

Q. Are those electric companies?

A. Such as electric light companies and gas companies, here and abroad.

Q. In reference to the reduction on account of services extended or increased, did you identify the items eliminated with the job tickets, or did you identify the eliminated items with the job tickets?

A. What do you mean by identify?

Q. Compare them?

A. Do you mean, did I take all the items comprised in Marwick, Mitchell's statement, and compare them with the job tickets?

Q. Yes.

A. No, I did not. I compared enough of them, and had them compared by others sufficiently to establish in my mind what they were.

Q. I have special reference, Mr. Carter, to your statement as it appears upon page 6345 where the question was asked:

"Q. Now, another point to which I call your attention, Marwick, Mitchell & Company in this exhibit included in their items rejected the sum of $1,850.31, being, as they state, the cost of certain expenses and increases to services in the year 1905, alleging that they should have been charged to construction account. That amount, if I recall, is so small that it is said it could not be expressed in cents per thousand and was not expressed by them. A. It was not expressed by them. Q. But there is a principle there involved," etc.,

6507 And you went on to give an expression of your views upon that subject.

A. Yes, sir.

Q. Now, assuming your explanation to be the correct one, that when the city has removed the pavement you put in an extra joint, say from the pipe to the sidewalk, it is, you say, a charge to repairs.

A. Yes, sir.

Q. Then is not this an addition or new work?

A. No, it takes the place of an old joint or service. That is already an item in our capital account and we consider that to depreciate the old and capitalize the new would reach the same result as to charge the work of increasing the size and the material to repair account.

Q. No, but as a matter of fact you take nothing away, you simply add to or improve a service and call it repairs, is not that so?

A. No, it is not an addition, it is a substitution of perhaps a 1¼ inch for a ¾ inch pipe from the main to the curb line.

Mr. MATHEWSON: You displace small pipes plus pavement, and replace large pipes, which equals the two?

The WITNESS: That is the theory upon which we charge it to repairs.

Q. You charge it to expenses?

A. Expenses as a repair item.

Q. That is what you designate as a short cut?

A. It is a short cut, labor saving and brain saving, and leads to the same result in our judgment.

Q. Don't you find it leads to confusion?

A. Not at all, sir.

Q. Now, when you increased the various services mentioned by you, you did not add anything to your construction account, did you?

6508 A. No, nor did we take anything from the construction account representing the old services.

Q. Well, should you not add the difference, between the service valued at five dollars and one at four dollars, that is a dollar, to construction account?

A. We do not think there is that difference. As has already been testified to, the service is laid in advance of new pavement at comparatively little expense. The probability is that the cost of laying the larger service under those conditions would amount to no more than the value at which the other service is carried on the books, plus the pavement.

Q. You admitted in your evidence yesterday that your books did not record what any particular joint cost, and that you could not charge a replacement unless a particular estimate was made for that charge, and that any such estimate would be an arbitrary one, didn't you?

A. I stated so, and it is a fact.

Q. It might be then, that your present method of treating these charges would lead you to charge operating expenses with what should really be construction?

A. I cannot concede that it leads to that result. I cannot believe that it does.

Q. Is it not the case, as a matter of fact, that the accountants were obliged to admit a large number of charges for small extensions of the service to the house, as your books and records were not kept in such a manner that they could be separated?

A. I am not aware of it.

Q. Your books as a matter of fact, are not kept for the purpose of supplying information easily and without considerable digging, are they?

A. (No answer.)

Q. Yes or no.

A. We think we can get a great deal of information from them without much trouble, Mr. Burr.

6509 Q. You are the only people who can. I think you have stated, Mr. Carter, that in your opinion the repairs and renewals and depreciation on your plant during the year 1905 were ample.

A. No, sir, I have not stated so; I have not made any statement of that kind.

Mr. Burr: I will withdraw that question.

Mr. Mathewson: Well, he has answered it.

Mr. Burr: Then let it stand.

Q. From the vouchers of Schmitt Bros, could you say definitely that no profit was included in the ten per cent. added when they were billed to consumers?

A. I can say specifically that there was no profit included in it.

Q. Was this not an arbitrary figure, its exact composition being unknown?

A. It was extremely conservative and probably did not cover all the expense that we were put to. It is not our policy to charge anything in the shape of a profit on transactions of that kind, and most of Schmitt's bills, as Mr. Hall had occasion to observe, bore no addition of that kind, and we would not have been living up to our policy if we had charged anything in that ten per cent. over and above the expense we were put to.

Q. Can you make up what expenses were embraced in that ten per cent.?

A. Itemize them?

Q. Yes.

A. I have not done so. I think it might be done.

Q. Well, you can have it in the morning, can you?

A. Yes, I think so. I should not say in the morning because there will not be anybody in the office to-night, and it will depend upon what time we will meet in the morning. I can make an effort to do so.

6510 Q. If the Consolidated Gas Company invested the money received on consumers' deposits, would it not practically reimburse itself for the interest paid?

A. Well, that would depend a good deal upon what sort of an investment was made; it might reimburse itself for some of it.

Q. Do you not consider it reasonable to take into consideration the fact that you have the use of this money as working capital?

A. Well, I presume those matters are all subjects of argument and will be taken up in their turn, Mr. Burr. I would rather not anticipate the argument of counsel in a matter of that particular kind.

Q. Well, you have presented a magnificent brief here, you were making an argument all day yesterday. Of course, it has been testified many times here that the Consolidated has a controlling interest in these subsidiary companies with which it has these agreements for the manufacture of gas; that is a fact, is it not?

A. Yes, sir.

Q. Now, holding this controlling interest, or in fact any interest at all, do you not receive in dividends, which you treat as miscellaneous income, a proportion at least of the ten per cent. which you charge your company with?

A. Well, that would be a return on any investment we made in those companies.

Mr. Mathewson: The question is whether that is treated as miscellaneous income?

The Witness: Yes, it is so treated.

Q. In other words you pay them ten per cent. over and above the cost of the labor and material employed in the manufacture of the product?

A. Assuming that it was a profit to them, or a return to 6511 them upon their capital invested in the business, and did not simply reimburse them for some other expenses, such as Marwick, Mitchell & Company suggested it might, insurance, depreciation and charges of that character——

Q. However that might be, they receive this ten per cent. and afterwards return a portion of it to you in dividends?

A. I cannot tell you whether they do.

Q. You have no knowledge on that subject?

Mr. MATHEWSON: Certainly the New Amsterdam does not.

A. Some of them I am sure do not.

Q. I think you have touched upon almost every subject that has been broached in this inquiry, and I am surprised that you are not familiar with the situation in that regard.

A. To trace that ten per cent. which we pay them to a dividend, and to say in case that——

Q. From those companies.

A. I think it would be a very difficult matter; I should scarce want to undertake to establish it.

Q. Well, assuming that to be the case, that would have the effect of really reducing the matter to being a charge against the operating expense and a credit to income on those investments.

A. That would be the case.

Q. You testified that certain mains were useless in 1903 and 1904.

Mr. MATHEWSON: No, temporarily disused and disconnected. They were not useless or they would have been marked abandoned at that time.

6512 Q. Well, when you made use of the expression disused did you mean abandoned?

A. No, I did not. By disused I meant disused.

Q. They were in a condition to be used at some future time?

A. That was the case, yes, sir.

Q. When you purchase material you charge it direct to the account to which you intend it to be used, don't you?

A. That depends upon the character of the material, Mr. Burr. We buy a great deal of material that is charged to stock account. All of our manufacturing material is carried in stock accounts and a great deal of our material for extending our distributing system and repairing it is carried in our stock account.

Q. Well, if subsequently you decide to use it for some other purpose, you make a cross entry in your books, don't you?

A. Where the material as purchased has been charged to some specific account, operating account and is used for some other purpose there is a cross entry made.

Q. That is the method with which you treat these things on your books, I am speaking of the books of the Consolidated Gas Company?

A. Yes.

Q. Do you not lay yourselves open to error in handling material in this manner?

A. No, I think we do not.

At 5:55 P. M. adjourned to Wednesday, January 30th, 1907, at 11:00 A. M.

Last Exhibits:

Complainant's, 369.
State's, OOO.
City's, 236.

6513 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,

vs.

Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucian L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, *January* 30, 1907—11 a. m.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Kirby, Mr. Burr.

6514 Robert A. Carter resumes the stand and further testifies.

Cross-examination by Mr. Burr (continued):

Q. From the rents you receive from gas stoves you are expected to keep them in repair, are you not?

A. Why, yes, we do keep them in repair.

Q. Well, this being so, does the credit of stove rentals not appear to you to be reasonable as made by the accountants?

A. Why, I don't think any alteration of our statements as made reasonable.

Q. On the contrary you believe them all to be unreasonable?

A. I believe them all to be rather fruitless of results since we show both the expenses and the revenue in all our calculations.

Q. As a matter of fact the company does repairs and other work for consumers and other companies, does it not, and credits the operating expense with the same?

A. Consumers and other companies? I don't quite understand.

Q. Well, for consumers?

A. Why, we do a great deal for consumers, yes, sir.

Q. And other companies?

A. Oh, you are referring to work done in the street, probably?

Q. Yes, whatever work you do for consumers, or whatever work you do for other companies you credit to operating expenses, credit your operating expenses with the same?

A. Yes, sir.

Q. Why did you do so in one case and not in another?

A. Well, in one case the charge that we make is specifically for work that is done and the charge comprises the labor and the material employed and very properly as the cost of the labor and the material appears in our expenses, the charge made to individuals or

companies should appear directly in the expenses as an offset
6515 to it. It is in no sense revenue and in no sense income, the
amount we receive from customers or companies for whom
we do work.

Q. Will you refer to page 1437 of Exhibit 87 and tell me what deductions made on account of advertising and legal expenses—does it not appear to be there $63,401.65?

Mr. Mathewson: I do not think your question reads quite clearly. You mean what the reduction is on that account?

Mr. Burr: Yes.

A. I don't notice any deduction made there. I notice a column headed "amount" and under it an item of $63,401.65 or .48 of a cent per thousand cubic feet, which of course is not .48 of a cent per cubic foot on any volume of sales employed by either Marwick, Mitchell & Company or the Consolidated in any statements that they have ever made.

Q. There are two columns, one headed "increase" and the other is headed "decrease." This item of $63,401.65 appears under the column headed "increase"—I mean to say there is a column there headed "increase or decrease," this item of $63,401.65 appears under that column?

A. It appears under that column of increase or decrease.

The Master: I do not know about that. The increase or decrease covers two columns, does it not?

The Witness: Yes, sir, it does.

Q. Well, it gives the amount and then gives the cents per thousand cubic feet?

A. Yes, sir.

Q. Now, will you refer to pages 1461 and 1462, and I will ask you
if you do not find the items of that amount to be as follows:
6516 Advertising, $6,020.34; Legislative Investigation expenses,
$28,876.60——

A. Where are you reading?

Q. Pages 1461 and 1462.

A. What page? You are not reading both pages, I presume.

Q. I haven't the exhibit here; I will give it to you. On page 1462 of exhibits, under the column headed "rejected," you find advertising $6,020.24?

A. Yes, sir.

Q. On page 1463, at the top of the page, you find "Legislative Investigation Expenses," $28,876.60?

A. Yes, sir.

Q. On the same page you find "amount insufficiently provided for prior to January 1, 1905," $7,705.38, and you find on the same page, do you not, "amounts not properly applicable to cost of gas for 1905, as detailed" $15,528.57?

A. Yes, sir.

Q. Then you find on page 1462 in the column headed "Rejected amounts," franchise litigation, $5,270.76?

A. I have enumerated all those items yesterday.

Q. Making a total of $63,401.65?

A. Yes, sir.

Q Now, you see in these figures the sum of $15,528.57 but once, isn't that so?

A. Entered but once, but the total contained in the .61 cents per thousand that appears on page 1432——

Q. We will come to that. The item of $15,528.57 appears but once there?

A. It appears but once on pages 1462 and 1463, but twice in the calculation, by which the rate per thousand was arrived at.

Q. It appears but once in the sum total of $63,401.65; is that right?

A. That's right, yes, sir.

6517 Q. Now, look at the bottom of page 1437, and do you not find that the decrease from the cost per thousand feet as shown by the accountant's statement as compared with your own statement is 22.31 cents?

A. I find a rate there of 22.31, which corresponds with other rates to which I have had occasion to refer as not being the rate per thousand on any volume of sales.

Q. Well, never mind. You find it there?

A. I find that figure there, yes, sir.

Q. Now, will you refer back to page 1432?

A. Yes, sir.

Q. And at the top there you will see a statement in these words: "The following is a summary of the amount excluded by us." And do you not find that the result of such summary is given in detail, and amounts to 22.31 cents?

A. I do not find it is given in detail. I find several items shown on page 1437 to which you have referred as being items excluded, including repairs to services, repairs to buildings, expense general office, adjustments and repairs to general apparatus aggregating .31 of a cent per thousand cubic feet, not shown at all in this statement on page 1432.

Q. Well, it appears there as 22.31 cents, does it not?

A. It does appear there as 22.31 cents.

Q. Well, that total of 22.31 agrees with the total deductions per thousand cubic feet as shown on page 1437, does it not?

A. It does.

Q. How is it possible? Can you understand how it would be possible that an amount should be deducted twice in the one statement and not in the other?

A. In this way: The amount is deducted twice in the item of legislative and franchise litigation .61 of a cent, and then the fact that such an error has been made disappears in the sundry adjustments which arbitrarily take care of all differences between the aggregate of the items enumerated, and the total of 22.31.

6518 Q. Does it so appear in dollars and cents there? If so, please point it out?

A. Does what appear in dollars and cents?

Q. The error that you spoke of that has been entered twice?

A. No; it is impossible to point out the error, because I say the error is taken care of in that item called "Sundry adjustments" in red ink in the total, and indicates a credit and takes care of any mistakes or omissions that may have occurred in making up that table.

Q. Can you point the error in dollars and cents so far as this item of $15,528.57 is concerned?

A. I did very clearly in my testimony yesterday point it out.

Mr. MATHEWSON: He showed that you have to include it twice to get your .61 of a cent.

The WITNESS: Yes, sir, it had to be included twice to get that rate per thousand, using their own factor of sales.

By Mr. MATHEWSON:

Q. If you did not include it twice it would not have given .61 of a cent, would it?

A. It would not, no, sir; nor would any other amount included give .61 of a cent.

By Mr. BURR:

Q. You see on page 1432 the last item in that column headed "amount per one thousand cubic feet" is an item entitled "sundry adjustments"?

A. Yes, sir; a credit item in the table.

Q. Do you know how that is arrived at?

A. No, sir, I do not, but I have indicated how a part of it is arrived at. It takes care of an error of .12 of a cent in the legislative and franchise litigation, among other things.

6519 Q. You say I understand that the accountants have pursued a different method of calculation from the method pursued by you in arriving at their cost per thousand cubic feet?

A. Yes, sir; in eliminating the lamp sales they pursued a different method than that pursued by us.

Q. It is not apparent from an examination of the figures to which I have called your attention on page 1432 that they are the same figures as shown on page 1437, grouped in a different manner and making allowance at the same time for the different methods of calculation?

A. I find 22.31 cents in both statements, which does not change the fact that there is an error in one if the items in statement on page 1432 which is adjusted into the item which handles apparently many things that I would not undertake to enumerate and I doubt very much if they could be intelligently enumerated.

Q. But you cannot point out the item $15,328.57 twice?

A. I have indicated that it was included twice in arriving at .61 of a cent per thousand.

Q. But you cannot point it out in so many dollars and cents?

A. Yes. You have read the amount a moment ago, you read it, what it amounts to, but it evidently has been included twice in making up his table.

The MASTER: Gentlemen, you seem to be wholly at variance on this point, do you think it is worth while to spend any more time on it?

Mr. Burr: I won't spend any more time on it just at present.

Q. You stated yesterday that the accountants had deducted between $78,000 and $79,000 on account of legal expenses.
6520 Do you find those figures anywhere in the account of Messrs. Marwick & Mitchell?

A. On what page?

Q. Page 6503?

A. I indicated on that page how an error had been made by which it was made to appear that .61 of a cent per thousand cubic feet was the amount rejected by the accountants in their table on page 1432 of the exhibits.

Q. As a matter of fact you get that amount of $78,930.22 by adding to the amount to which I have previously made reference ($63,401.65), this item of $15,528.57 do you not?

A. Yes, sir, I do, making that addition for the purpose of demonstrating that it was included twice in the amount which represented the .61 of a cent per thousand cubic feet of gas sold, using their factor of sales.

Q. Now, you have not had any experience in keeping the accounts of any gas company outside of the city of New York, have you, Mr. Carter?

A. Oh, I have had occasion to see the accounts of a great many gas companies.

Q. But the method by which you seek to determine the cost per thousand cubic feet of gas is the same with regard to all the companies, the constituent companies of the Consolidated—the Consolidated Gas Company and its constituent companies, is it not?

A. Yes, sir.

Q. You have no more information on the subject of the original companies than Yalden had, have you, nor do you pretend to have any more information than he had?

A. With respect to what?

Q. With respect to anything and everything appertaining to those constituent companies?

A. Well, the testimony itself furnishes evidence that apparently Mr. Yalden did not have.

Q. In other words all that you desire to appear as saying
6521 here is taking the evidence that was produced in 1886 before that commission and arriving at a different conclusion from even the minority or majority of the Committee?

A. I have tried to arrive at a correct conclusion without considering whether it conflicted with the conclusion of the majority or minority committee or not.

Q. I want to call your attention to this one thing, you have arrived at a different conclusion from even the majority of the committee, as I understand you find that because there were certain things left out of their consideration the amount of capitalization should be even larger than it was at that time.

Mr. MATHEWSON: No. In the first place whether his conclusions disagree with the majority opinion or not appears from his conclusions and the majority opinion which is in evidence. As a matter of fact his conclusions do not agree with the majority opinion at all.

Mr. BURR: My understanding of his testimony was that he said that there had been left out of the consideration of Yalden and therefore the consideration of the committee large items of real estate, for instance from the Knickerbocker.

Mr. MATHEWSON: If you read the report of the majority you will find the majority say in substantial words that it is not necessary to go into the original cost, because the Act of 1884 authorizes the consolidation of the companies upon the then value of their properties and that that is the value with which they have dealt.

6522 By Mr. BURR:

Q. Don't you find from a careful reading of that report as you have given it that Mr. Yalden included real estate of the Knickerbocker in the assets of the Municipal Company?

A. I am very sure that he did not, absolutely certain about it; there is no question about it, he so testified himself.

Q. Do you find that he intended from any statement that he made, that he intended to embrace it in the assets of the Municipal?

A. He distinctly stated that he did not intend to do it and had not done so.

Q. Did he state any reason why he left it out?

A. He did.

Q. What was the reason?

A. Because the books of the company were not in evidence and he was unable to get a book value, and therefore could not include the value of the property.

By Mr. MATHEWSON:

Q. You mean the books of the Knickerbocker?

A. I mean the books of the Knickerbocker.

By Mr. BURR:

Q. Where did you find they took their values from?

A. They testified from their knowledge, presumably from the books of the company as they had access to them and had seen them.

Q. The books of the company were not in evidence—you have never seen them from that day to this, have you?

A. No, sir.

Q. And the witnesses were not testifying from the books of the company because the books of the company were not produced according to Yalden and therefore Yalden could not arrive at the figures of that real estate?

6523 A. A. He did not arrive at it. He knew there was real estate and knew it was transferred to the Consolidated Company, but in his summary of the value of property, as shown by the books of the old company, he did not include any real estate of the Knickerbocker Company.

Q. You have no personal knowledge on the subject at all, have you, other than that derived from whatever knowledge you may have or information obtained from the perusal of this testimony in this exhibit, which was offered in evidence yesterday?

A. From the perusal of Yalden's testimony and of his own exhibit.

Q. Now, are not stock records usually kept in works, storerooms? Are they not more a protection against misappropriation of property than the system you have adopted and which the accountants have criticized in their report?

A. Stock records kept in works storerooms?

Q. Yes.

A. There are such records kept. The Board of Advisory Engineers, represented by Mr. Lacombe and Mr. Marks, reported on that, and in very complimentary terms.

Q. Do you mean to say there is a stock ledger kept?

A. No, not a stock ledger.

Q. You made a mistake I think the other day when you unintentionally said that Mr. Hall had visited your shops?

A. Mr. Hall did not visit our shops, no. If I said so I was mistaken. It was Mr. Lacombe and Mr. Marks.

Q. As I understand your testimony you claim that renewal and depreciation are practically the same thing, one and the same thing; isn't that your claim?

A. No.

Q. Wherein does the difference exist, according to your view?

A. I think that in the long run the probability is that all depreciation would ultimately materialize in the shape of renewals.

6524 Q. Now, say for example you bought a table for your office and at the close of the year it has depreciated by 20 per cent.; the next year you buy a desk. Are these not two separate and distinctive transactions, one a charge for depreciation on old furniture and one an investment of capital for new furniture?

A. That is the case. Ultimately we will buy a new table and our capital account will not bear the burden of two tables.

Q. Before you can say that your depreciation was expended in renewals it would be correct and proper to identify the depreciation with the items renewed, would it not?

A. Not necessarily.

Q. I understood you to say that Marwick, Mitchell & Company referred in their report to certain real estate amounting to $20,942,000?

A. No, sir.

Q. That was a mistake?

A. Will you kindly give me the page so I can see what was said in that connection.

Q. It was the day before yesterday. As a matter of fact it does not appear in their report.

Mr. **Mathewson**: What the $20,942,000 represents we all perfectly understand, and if any such expression was used it must have been a slip of the tongue. That is the amount at which the property was carried on the books of five of the six original constituent companies—all the property.

Q. And it is quite clear to you from the report of Marwick, Mitchell & Company that the reason why the Knickerbocker real estate was not included was for the same reason as found by Mr. Yalden, that they did not have the books?

A. Not exactly. They did not have the books of the Metropolitan Company and still they included that real estate in their statement.

6525 Q. Where did they get the Metropolitan real estate from?

A. They allege in their report to have taken it from Mr. Yalden's figures in document 47.

Q. The Knickerbocker real estate did not appear in Yalden's report, did it?

A. No, sir.

Q. So, therefore, they could not find that either in Yalden's report or on the books of the company, which were missing?

A. No, sir.

Q. Did Mr. Hall during the progress of his examination of your books call your attention to the manner in which your books are kept, so far as omitted footing and calculation not extended, and so forth, were concerned?

A. No, sir.

Q. In the manufacturing records?

A. No, sir.

Q. Have you any doubt that there were a great many calculations to be made and footings to be made, and calculations extended by the accountant?

A. Oh, yes, very grave doubts about it.

Mr. Burr: There is a good deal of Mr. Carter's testimony that I do not regard as worth while to cross-examine with regard to, I regard it simply as more of an argument than the presentation of facts, and I will reserve my presentation of counter-propositions upon the same facts for a brief, rather than to consume the time of the court in conducting a lengthy cross-examination, which may just as well be presented in the form of a brief.

Q. You have testified regarding the candle power which you found in the various companies. Can you state the candle power of the gas at the water gas stations of the Consolidated Company, 21st Street, 44th Street, 99th Street, exceeded the candle power at the New Amsterdam Company station during the year ending 6526 October 31st by .41 of a candle power, in view of the fact that the exhibits put in by the city giving the tests of Dr. Love at the City Testing Station show a higher candle power at those stations of the New Amsterdam than the Consolidated, and we would ask what was the candle power that you found at the New Amsterdam during the year in question?

A. I don't think I have the candle power of the New Amsterdam for that year. I think the figures were not for the nominal year ending October 31st, 1905, and the candle power was the station candle power and not the district candle power.

Q. Have you that data from which you compiled your conclusions, or made up your conclusions?

A. Not in detail, I have it by months if you desire.

Q. Have you got it?

A. No, I haven't got it. You would like the candle power of the New Amsterdam Company each month?

Q. Yes, the station candle power for each month.

Mr. Mathewson: From which you get your average?

The Witness: Yes, it is a very simple matter. I will produce that, with pleasure.

Q. Now, when the term long ton is used in reference to coke made at the Central Union how many pounds are to be understood?

A. The term long ton means 2,240 pounds.

Q. When the term ton is used with reference to coke made at the Central Union how many pounds are to be understood?

Mr. Mathewson: Do you mean when this witness uses it?

Mr. Burr: Yes.

6527 A. I don't think that I have had occasion to use it except in connection with Mr. Bemis' testimony, when I just simply used his statements without any reference to the number of pounds.

Q. What do you understand the ton referred to by Mr. Bemis to mean, so far as the number of pounds; how many pounds Mr. Bemis uses to his ton?

A. Yes. I understood him to testify he used 2,240 pounds.

Q. Do you understand that to be the same amount as used in the returns of the Central Union?

A. I understood you were asking about the Central Union.

Q. Yes.

A. In the returns of the Central Union?

Q. Yes.

A. Yes, I believe they use long tons, 2,240 pounds.

Q. And their returns to the Gas Commission?

A. Oh, to the Gas Commission? I don't know.

Q. How is it as to tons of coke sold?

A. My understanding is they are long tons of coke.

Mr. Mathewson: Are you referring to the returns to the Gas Commission or what? because we know nothing about their returns to the Gas Commission. They have not been presented by anybody that I know of. You are talking of a document we know nothing about and have no knowledge of as to the theory on which it is made up.

Mr. Burr: When I say return I mean, Mr. Mathewson, the evidence which you yourself referred to and brought into this case on behalf of the Central Union before the Gas Commission.

Mr. Mathewson: You mean the tesimony before the Gas Commission?

Mr. Burr: Yes.

6528 Q. Now, with that explanation can you state how many pounds are to be understood in the tons of coke?

A. I can only give my impression as gathered from Mr. Bemis' testimony that it was 2,240 pounds. I have not had an occasion in any calculation I have made or any testimony I have given to use the pounds or tons in any way, have not dealt wtih them at all, and consequently I have not had occasion to know what factor the Central Union Company uses.

Q. How many pounds per ton are to be understood in the Consolidated plant in the case of coke made?

A. 2,240.

Q. And that is true also in the case of coke sold by the Consolidated?

A. We do not sell any coke by the pound or any coke by the ton.

Q. It must be measured in some way?

A. It is measured in loads. We sell it by the load, an average of 1,500 pounds to the load and 2,000 pounds to the load of screenings, and we have no—we don't keep our records in pounds or tons, but in loads.

Q. You have stated Mr. Bemis should have given $3,676,000 instead of $4,676,000 when he was making comparisons between 1884 and 1895. That was a clerical error in favor of the company, was it not?

A. Quite likely it might have been in favor of the company, Mr. Burr. I would call attention to it nevertheless.

Q. You have stated Mr. Bemis deducted twice over from the assets of the company $1,985,874.37 received for land. Does this criticism apply to certain bulkheads condemned and not paid for, which he gave as $317,000 on page 364 of the testimony?

A. If they were included in the nineteen million dollars and have
not yet been deducted from our book value of our property,
6529 why, of course, to that extent there would have been no
duplication, but with respect to all the rest of the property
which has been dealt with in our accounts and the credit shown in our accounts, and the net increase in the value of our property thereby diminished to that extent Mr. Bemis' calculation operated to deduct that twice over.

Q. Does that apply to the $875,916.37 of the land that was condemned but not yet paid for by the city?

A. Not to any land that has not been paid for, but to such land, or such property, as the property as sold or the proceeds of that have been credited to the company's property accounts.

Q. They have not been paid for, have they?

A. Which?

Q. The bulkheads?

A. The 18th Street property has not been paid for.

Q. Can you state how much was due from consumers November 11, 1884, as compared with the amount due from consumers October 31, or December 31, 1905?

A. I cannot, Mr. Burr, at the moment.

Q. You can get that for me very easily?

Mr. MATHEWSON: He can if it is material. I do not think it is.

Q. Mr. Addicks has testified as to increase in wages lately. Will you tell us what are the wages per day of stokers and common workers of the most numerous class of workers in your coal and water gas stations, and will you state what rate and hours per day you use of wages for the three or four most numerous classes of labor in coal and water gas manufacture, and please state whether these are the wages since the recent increase?

6530 Mr. MATHEWSON: I suggest this is not cross-examination of this witness; and, secondly, in checking up the exhibits in evidence the accountants went over or had full opportunity to go over the wage payments and all that.

Mr. BURR: He has arrived, as I understood him yesterday or the day before, at certain costs of labor, and instead of asking that long question, probably I might have obviated the matter by asking him to please give the details by which he arrived at the price of labor.

Mr. MATHEWSON: You referred a moment ago to Mr. Addick's testimony.

Mr. BURR: Mr. Addicks testified to the increase in wages, but Mr. Carter has, I understood, testified to a certain labor cost.

The MASTER: You may cross-examine him now as to what he did say about labor cost.

Mr. KIRBY: It is set down in comparison with Mr. Edgerton's figures, giving the amount of labor in that manufacture, of the cost as a total, and I think Mr. Burr is inquiring as to the details.

Mr. BURR: I would like to know the details.

Q. On page 6379, Mr. Carter, you gave labor cost, making and purifying 78.95 cents per ton, making 7.42 as against one thousand cubic feet of gas. What was the basis of that figure?

A. The actual cost of labor during the nominal year ending October 31, 1905, is shown by all our exhibits in the testimony.

Q. Did that take into consideration the increase in wages?

A. No, sir, it was the wages as they were paid during the nominal year ending October 31, 1905.

6531 By Mr. MATHEWSON:

Q. Nominal or calendar year 1905?

A. That was the nominal year.

By Mr. BURR:

Q. Can you give me the items of that labor, what rate?

A. No, sir, I cannot.

Q. Well, you must have had some paper from which you made up this conclusion or deduction regarding that item?

A. The statement is in the testimony wherein these items of labor are enumerated and have been checked by the accountants and found correct.

Q. I am calling special attention to this item of labor, as appears on page 6379, and which you have summarized as representing a cost of 78.95 cents per ton, making the cost against a thousand cubic feet of gas of 7.42. I ask you if you would be good enough to let me have the details of that calculation?

A. The details of the calculation are the cost per thousand, as shown there, converted into a cost per ton by using the factor of the cubic feet of gas produced per ton of coal. That is all the calculation there is to it. It is our own actual cost of labor in coal gas manufactured reduced to a cost per ton which we have never showed in practice, as it is of no use to us, but shown there for the purpose of making a statement conforming to Mr. Edgerton's.

By the MASTER:

Q. Taken from Exhibit 94?

A. No, sir, because that is all our labor, and I am dealing with comparisons with 14th Street only. The 14th Street cost is shown in two exhibits for the calendar year—in Exhibit ZZ and for the nominal year. In that case I do not know whether it is in
6532 this testimony or not.

Mr. MATHEWSON: I think so.

Q. In arriving at that cost, what I want to get at is, what rate of wages and hours per day were used by you?

A. No rate of wages, no hours per day, but the actual cost per thousand cubic feet of labor at the 14th Street station, and of course, the rate or whatever was paid at that station during that time.

Q. That was the sole information you had in making up your conclusion as to cost per ton?

A. Exactly.

Q. On page 6374 you state that the cost of the Standard was 30 cents, or .62 lower than the Consolidated. This means that the cost of the Consolidated was 30.62 cents, does it not?

A. The Consolidated was 30.62, yes, sir.

Q. Will you point out any testimony or give now the data on which you base 30.62 cents for the Consolidated water gas, and 30 cents for the Standard?

A. The Consolidated I gave in great detail in my testimony, giving each station; the quantity produced and the cost in dollars, and the total, and the rate per thousand and showed what items had to be deducted in arriving at a figure comparable with the New Amsterdam Company, the figure deducted being a certain item of depreciation, and an item of experiments, neither of which items of expense appeared in the cost of the New Amsterdam Company. The result was 30.62 and it is all plainly spread out in my testimony.

Q. You observe, do you not, at page 26 of the Mutual exhibit that you have offered here that oil costs the Mutual 4.495
6533 cents per gallon, or 21.26 cents per thousand feet——

Mr. MATHEWSON: I don't know what you are referring to as having been offered in evidence.

Mr. BURR: Didn't you refer to the return of the Mutual? You have referred to the return of the Mutual in comparison with the Consolidated, have you not?

Mr. **Mathewson**: That is the cost at the station for the Mutual as compared with the cost at the station of the Consolidated.

Q. Now, I call Mr. Carter's attention to the testimony in that case, Exhibit 31, in the case of the Mutual, before the Gas Commission, and ask—you observe, do you not, on page 26 of the Mutual exhibit that oil costs the Mutual 4.495 cents per gallon, or 21.26 per thousand feet, while the cost for October 31, 1905, at 21st Street was 4.08 cents per gallon, or 18.84 cents per thousand at 44th Street, or 19.18 per thousand, and at 99th Street was 4.05 per gallon or 17.80 per thousand; in other words, the difference in the cost of oil extends over two cents per thousand feet of the excess cost of the Mutual.

Mr. **Mathewson**: If you want the witness to answer these questions, make those comparisons, I must ask that the record be produced so that he can make them. I cannot allow him to rely on his memory unless he is perfectly sure as to all these decimals.

Mr. **Kirby**: He had a very good memory on his direct examination.

Mr. **Mathewson**: Oh, no, he had the data. He may have the data here by which he can make the comparison. If so I have no objection.

6534 A. It still leaves the Mutual gas costing more than the Consolidated gas even taking into account a variation of the cost of oil.

By Mr. **Mathewson**:

Q. Even assuming the variation is as counsel just stated?

A. Yes, it still leaves the Mutual cost higher than the Consolidated cost.

Q. Are you able to say from memory whether the assumed percentage is correct or not?

A. In this particular case?

Q. Yes.

A. No, sir, I am not.

By Mr. **Burr**:

Q. Well, you have got the exhibit before you, haven't you?

Mr. **Mathewson**: It is not the printed Mutual record that is before the witness, and he has not the other papers before him in any shape.

Q. As I understand, there was an exhibit offered before the Gas Commission, No. 144, giving the amount of gas manufactured by the Consolidated during the month, beginning the 1st of November, 1904, and ending the 31st of October, 1905. Do you recall such an exhibit? It has also been introduced in evidence in this case.

A. I think there possibly may have been such an exhibit. I would like to see it before testifying about it.

Mr. **Burr**: I have just sent for it. We do not appear to have it here.

Mr. **Mathewson**: Well, where is it in this case as an exhibit? I don't know anything about it because I did not even represent the Mutual before the Gas Commission.

6535 Mr. Burr: I have no reference to the Mutual. I am speaking of the exhibit introduced by the Consolidated before the Gas Commission, which record has also been introduced in evidence in this case here.

Mr. Mathewson: Oh, that is another proposition.

Q. I show you a copy of it, Mr. Carter, and ask you to say whether that to the best of your knowledge, information and belief correctly shows the gas sales for those months that I had referred to between the 1st of November, 1904, and the 31st of October, 1905?

A. The gas sales by the Consolidated Company during the nominal year ending October 31st, 1905, are given in Exhibit 93 in this case, and I think as that has all been checked and confirmed in every way perhaps it would be better detail to introduce now, or for me to testify from than anything else.

Q. The amount as given on this exhibit, a total of 13,308,363,773?

A. Those figures sound very familiar to me. I should say they were the sales for the nominal year ending October 31st, 1905.

Q. You referred to Mr. Marks' statement as you claim as having been made by him that the Consolidated was going to operate in Queens County or in Kings County. Don't you find in that connection that he referred to the operation of the Astoria plant in Queens County or in Brooklyn, the undisputed testimony being that the Consolidated Company owns all the stock of the Astoria?

A. I don't recall Mr. Marks' testimony very well. If he made any reference, however, to any output of gas in Queens Borough or Kings County he was far away from the fact, Mr. Burr. If you are simply referring to the production of gas in the Borough
6536 of Queens for distribution in New York, why I do not think there is any criticism to be made of his testimony.

Q. But, Mr. Carter, you do not wish me to understand you as claiming that the Astoria Company cannot operate in Queens County and sell gas in Queens County?

Mr. Mathewson: Have you introduced any franchise or anything else here, Mr. Burr, showing that the Astoria Company has franchises to operate in the Borough of Brooklyn and Queens? If so, they have escaped my notice. The Astoria is a manufacturing company, not a distributing company.

Mr. Burr: You are furnishing gas to the New Amsterdam and East River companies.

Mr. Mathewson: They are manufacturing gas and not furnishing it to consumers. They are not furnishing it to the New Amsterdam either. They are sending it to the Consolidated in New York through the tunnel, so far as they have begun to manufacture, as stated.

Mr. Burr: I do not think it is claimed seriously that the Astoria Light, Heat & Power Company cannot make and distribute gas in Queens County.

Mr. Mathewson: It is seriously contended, if you want the statement, that so far as I know I don't know that they have any franchise to distribute gas in the Boroughs of Queens or Brooklyn.

The MASTER: Do not argue it further. The witness has answered it responsively, as far as I understood his answer.

6537 Q. The Astoria is delivering gas to the company, the Astoria Company, is it not?

A. Yes, sir.

Q. Mr. Addicks testified the other day you had not at the time he was testifying agreed upon the price which you were to pay to the Astoria Company for the gas being so delivered. Have you yet agreed upon the price?

A. No, sir.

Q. You criticised the amount of the land and structural cost obtained by Mr. Marks in his statement of valuation which he derived early in this inquiry from your incomplete data, amounting to $3,068,140.51. Will you be good enough to refer to Exhibit 87, page 1562, and do you not find the original cost of land to the six constituent companies or the consolidated companies to be $3,377,971.10 up to 1884?

A. No, sir, I don't find anything of the kind. I find a statement of the value at which a portion of the real estate, a large portion of the real estate was transferred to the company in 1884, and was carried on the books of the constituent companies, excepting the books of the Knickerbocker Company.

Q. Of course you know nothing of your own knowledge with respect to mains, Mr. Carter, and what information you have on that score I understand you take from Mr. Simpson, or from the men who have practical knowledge with regard to mains, whether they are diseased with pits, or whether they are disused, or whether they are abandoned?

A. Nothing of that character. The practical character, Mr. Burr, would come from Mr. Simpson to a very large degree, but with respect to the cost of labor and material employed in extending I should have probably more information than the department itself would have.

6538 Q. Well, Marwick, Mitchell & Company give the number of miles of mains according to the books of the company to be something like 804,594 on December 31, 1905; is that correct, according to your books?

A. That is correct, yes, sir. You are comparing, I presume, the other figures given as of October 31, 1905?

Q. Does that include everything but abandoned mains?

A. That includes everything but abandoned mains, yes, sir.

Mr. BURR: That is all I want to ask, Mr. Carter.

Mr. KIRBY: I have a few questions which I intended to ask yesterday, which I omitted yesterday by turning over two of my pages of notes instead of one. The first is on page 6375 and 6376 where Mr. Carter states in answer to a question:

"A. So far as experience goes, the calculations of that nature at Astoria in connection with the construction of the plant at the present time amount to 11.662 per cent. of the amount expended," referring to engineering charges.

The WITNESS: It should not be "calculations," it should be expenditures, on page 6376.

Q. Will you kindly tell me what those expenditures were? And when made?

A. They are in the nature of salaries of engineers, draughtsmen, inspectors and engineering department generally, the cost of borings and soundings, the cost of temporary structures, the taxes and insurance, the cost of repairing temporary structures, and expense of that nature.

6539 Q. When you say engineers, to whom do you refer—engineers directly employed by the company?

A. Engineers directly or indirectly employed by the company.

Q. Do those engineers include any of the employees of the company who have or are providing other services than those having to do with Astoria?

Mr. MATHEWSON: Which company?

Mr. KIRBY: The Consolidated Company.

A. Well, if there are any individuals, any engineers whose services are divided between both companies, their time or their salaries are divided and so much of it as applies to the Astoria construction operation is charged to the Astoria Company and appears as one of the items of the expense of this character.

Q. Will you tell me when these expenditures commence?

A. I should say they commence as far back as 1900, Mr. Kirby.

Q. And your plans have now all been made and specifications drawn up, and all that remains to be seen in regard to Astoria is the completion of the units as laid out?

A. That is my understanding at the present time.

Q. So this 11.62 per cent. which has been paid out in the manner you have indicated would probably care for all such charges as might be attributable to Astoria, unless there should be some change of plan.

A. I would not like to commit myself to that proposition because the expenses of that character are still going on in connection with the completion of the plant there, and would be probably taken into account when the plant is finally completed as to the first unit.

6540 Q. In other words, there will be inspection of buildings and things of that kind?

A. Yes, sir. I don't think it will be very considerable in addition to this amount, I would not like to say how much or how little.

Q. Did the Consolidated Gas Company lay down the plans for the Astoria Company itself, or the Astoria company?

A. The Astoria Company.

Q. So when we speak of this amount as a charge for engineering I presume it is immaterial whether charged up against Astoria, or the Consolidated?

A. No, this is all charged up against the Astoria Company, although if the disbursements may have possibly been made by the

Consolidated Company it would be charged against the Astoria Company, but would not appear in any permanent record and expenses in the Consolidated station.

Q. That is the way I understood it, and the reason for my question. Now, the entire expenditure at Astoria is contemplated to be something about thirteen million dollars, is it not?

A. Yes, sir. I think when the first unit is completed it will approximate that sum, that is my recollection of the testimony as given by Mr. Bradley.

Q. So that this percentage would amount to over one and one-half million dollars, would it not, as applied to the estimated cost of the plant?

A. Not necessarily, because the entire cost of the plant would include the cost of the land, and the grading of it, which is not taken into account here.

By Mr. MATHEWSON:

Q. The tunnel?

A. The tunnel.

6541 By Mr. KIRBY:

Q. Between the grading of the land and the tunnel, have you not employed engineering skill and advice?

A. The tunnel remains to be constructed.

Q. You have made borings?

A. And that is included in that percentage figure which you have given?

A. Yes, although as an item of expense in the tunnel it is probable, so far as that preliminary work is concerned, completed; I presume so.

Q. So with your gradings and matters of that kind, while it has to do with the land as land nevertheless it is part of the system of the installation of the plant, and any engineering cost in plans, in draughting, which had to be done, I presume is included in this percentage?

A. No, this is the cost of engineering in the course of construction of the plant.

Q. And has nothing to do with the grading or the laying out?

A. No, sir, we do not consider that the labor of filling in real estate requires a great deal of engineering or any engineering expenses.

Q. Don't you make plans to get your grades and place the buildings properly?

A. Yes, I daresay there are several items of expense of that kind.

Q. And those would be included?

A. Yes.

Q. Now, I refer you to page 6411 in the next day's testimony, where you said in answer to a question by Mr. Mathewson, the answer being:

"A. The amount stated in the special franchise report to the State Board of Tax Commissioners to have been the value for purposes of taxation for tangible property in the street was originally furnished to me by Mr. Simpson——

6542 Q. Well, the figures are the ones which were furnished by Mr. Simpson on his basis of material and labor in soft earth? A. That is the case."

I presume you have no more information on this point than Mr. Simpson, have you?

A. Oh, no, sir. Mr. Simpson has testified at considerable length in that connection, and I could not add anything to the testimony that he has given.

Q. Now, look at page 6495, where you speak of Mr. McMillan's companies, where you answered in regard to a question by some one—I don't know whom—

"Q. I say, you have made some investigations to support that opinion? A. Why, yes, sir. It is supported by the testimony I have just given with respect to the McMillan companies where gas is selling at eighty-four cents and they do not begin to burn as much as they do in New York City."

I ask if you know how much gas was burned by the consumers of the McMillan companies before and after the reduction in price made by those companies?

A. No, I only know what it was after it was made.

Q. I refer you to page 6421, with reference to the Mutual Company, where you state: "The actual investment of the Mutual Company, as shown by their statement, referred to by Yalden, was $8,284,515," and so on, and I ask if you know the amount of share stock issued by the Mutual Company at the time of consolidation of the companies now forming the Consolidated?

Mr. Mathewson: Objected to as immaterial and having nothing to do with the proposition.

6543 Mr. Kirby: It has to do with the statement referred to by Yalden set down in the report.

Mr. Mathewson: No.

Mr. Kirby: I do not want to go all through Mr. Yalden's testimony and show this thing in that way. If it is objected to and it is ruled out I will put it in and we can let it go that way, because it is point.

Objection sustained; exception.

A. The share capital outstanding at that time was three and one-half million dollars.

Q. By that you mean the par value of the stock?

A. Yes, sir.

Q. Do you know how much was paid in on that stock?

A. In arriving at my figure I deducted $1,000,000 representing the discount at which it was alleged that some of that stock was issued. I assume that half of the par value of $5,000,000 of the stock was realized.

Q. Had been paid in in cash?

A. Had been paid in in cash; and my calculation or my result of $6,275,904.96, eliminates $1,000,000 from their then share capital.

Mr. Kirby: I ask now that that question be allowed to stand. I think the answer of the witness has shown very clearly the materiality of it.

The Master: I can easily reverse myself, Mr. Kirby, either now or at any time before I dispose of the case, and I shall not hesitate to do so if it seems to me to be necessary.

Q. Now, I refer you to page 6368, commencing at the bottom of 6367 and carrying over to page 6368, where you make a certain assumption as to Mr. Edgerton's figures, that 33% of gas oil that was used at the 42nd Street station in enriching the coal gas made there? 6544

A. Yes, sir.

Q. Is there any reference in any place as to the coal tar produced at 42nd Street upon which Mr. Edgerton, as you claim, based a loss of 33% from the gas oil used?

A. The testimony was to the effect that the Consolidated Company by its oil bench process was producing 33% of oil tar, and my testimony was to the effect that there was no foundation whatever for that statement.

Q. Then your statement here on page 6338 is based upon your assumption that he uses the coal tar produced as a basis of his calculation?

A. I assumed that because it was the only statement, the only records we have where 33% could be obtained by using any factors whatever in evidence in the report.

Q. You made a calculation coming to practically the same figures that he used, you assumed that was what he used?

A. Yes, sir; precisely so.

By Mr. Burr:

Q. Do you not understand that the stated object of the consolidation of the constituent companies into the Consolidated Gas Company in 1884 was to reduce the price of gas to the consumer by curtailment of expenses, centralization of their works and manufacturing at a minimum of expense.

Mr. Mathewson: I don't know as it makes much difference. I shall not object if counsel thinks it is important.

Mr. Burr: I would like to have Mr. Carpenter's views on that subject.

6545 The Master: What his understanding is as to some statements made some twenty odd years ago I do not believe to be material.

Q. Wasn't that the object of the consolidation? You were there at the time?

The Master: Stated object?

Q. Was it not, Mr. Carter?

A. I believe it was stated to be the object by some of the witnesses before the Senate Committee, Mr. Burr, and the fact that the price of gas was reduced at that time from $2.25 to $1.75 a thousand would rather tend to support that statement.

Q. In other words——

Mr. KIRBY: The Legislature had nothing to do with that, I suppose.

The WITNESS: No, sir, it was a voluntary action on the part of the Consolidated Company.

Q. In other words you do not understand for a moment that the object of consolidation was to increase the price of gas to the consumer? It was to reduce it, was it not?

Objected to.

The MASTER: I do not see the materiality of that, Mr. Burr.

Question withdrawn.

Redirect-examination by Mr. MATHEWSON:

Q. This reduction from $2.25 to $1.75 in the price of gas was practically the first act of the Consolidated Company after it came into existence, was it not?

A. That was the case, yes, sir.

Q. Referring to this 33⅓%—should it not be, instead of cents, at page 3368?

A. Yes, it should be 33⅓%.

6546 Q. No matter what figures were used was any such result obtained at 42nd Street as Mr. Edgerton testified?

A. No, nor anywhere else.

Q. In reference to Mr. Edgerton's testimony regrading 21st Street, I read as follows from page 5361 of his testimony:

"I say in those places where there was nothing on the foundation or requiring a foundation I did not calculate it, and there was no definite description by Mr. Mayer. It just said foundations for machinery."

At page 5362 (Mr. Edgerton's testimony) "There were quite a good many in 21st Street, right straight through each range of buildings, foundation for machinery and no machinery on the foundation."

Now I certainly have quoted this accurately, and I ask you whether as matter of fact there were foundations for machinery there and no machinery on the foundations?

A. Not one.

Q. You have been questioned in respect to the depreciation charges of the company, and as to whether amounts were spent or not. Now where an item appears as a repair, is that a charge to operating expense?

A. Yes, sir.

Q. Where a piece of main or other apparatus is abandoned and taken out of your property account, does that item whether marked depreciation or otherwise also become a charge against operating expenses?

A. It does, yes, sir.

Q. Is there the slightest difference as to the result whether called a repair or depreciation or renewal?

A. No difference whatever.

Q. As a matter of fact, according to the English practice, repairs and renewals of that character or depreciation which needs renewal are simply charged to a general account called wear and tear, aren't they?

A. That is the case, yes, sir.

6547 Q. Now you were asked what would be the result if the proposed renewal were not made. Assume that a main was abandoned today, that would be charged against operating expense as a depreciation, would it?

A. Yes, sir.

Q. Would it make any difference as to its being charged against operating expense as depreciation, whether the plants stopped tomorrow or continued for a dozen years?

A. Not a particle.

Q. In other words the depreciation charge would be simply the ordinary charge which a company has to put into its operating expense to keep its plant up to par and unimpaired?

A. That is the case, yes, sir.

Mr. Burr: I do not like to make objections, but I think it is only fair to say that Mr. Mathewson should let the witness testify and not put all these things in his mouth.

The Master: Mr. Mathewson, I think that is a fair criticism. If you had an unintelligent witness you might perhaps be permitted to lead him to a certain extent.

Q. On page 1466 of the exhibits, the amount of depreciation charged by reason of loss in property account for the calendar year 1905 appears in total to be $282,219.67, if I read correctly, is that right?

A. That is the amount, yes, sir.

Q. Now, during that year while plant was charged down only $3,424 by reason of abandoned or lost apparatus, was a greater or less sum than that spent in additional plant which made up that amount of depreciation?

A. Why, the amount was expended during that period very largely in excess of that.

6548 Q. And if you take the entire plant account for the year 1905 by reason of the charging out of these items of depreciation representing property lost or abandoned, how much would the plant account be reduced in total if there had been no new construction?

A. If there had been no new construction whatever the property account would have been diminished by the total amount of depreciation $282,219.67.

Q. Now, as a matter of fact did the total plant account of the company during that period show such a loss?

A. It showed an increase, Mr. Mathewson, during that period.

Q. Would that indicate or would it not indicate that the plant account had been replaced, taken in the whole by more than the amount of depreciation charged off?

A. It would so indicate, yes, sir.

Q. If you came to any particular item such as plant or mains or services or meters or meter cocks, for instance, is it possible by a single year to get an average of expenditures of depreciation and replacement?

A. No, not necessarily.

Q. You spoke of something being renewals. If a piece of apparatus is charged off or lost that appears in what account primarily?

A. Depreciation account, the piece charged off.

Q. We will assume that it is main worth $1,000. New main is laid in that year or during the period which you assumed, the amount we will assume being $3,000. Is that charged simply to construction?

A. The new main?

Q. Yes, sir.

A. As construction, yes.

Q. As a matter of fact, how much of that $3,000 expenditure is required to offset the main lost and abandoned, the original main lost and abandoned having been stated to be $1,000.

A. $2,000.

6549 Q. No, you do not understand.

A. The entire $3,000 has got to be expended unquestionably, if I understand your question.

Q. To replace that main I assume to be worth $1,000?

A. Yes; $1,000 is required to offset the loss in the main that was abandoned.

Q. And how would your capital account then stand at the end of the period as compared with the beginning?

A. Augmented $2,000.

Q. So as a matter of fact what you call renewal, is it anything else than the amount required to pay for depreciation in the particular line?

A. Nothing else.

Q. When you said that 10.89 had been spent on the average during the 20-year period from 1884 or 1885 in repairs and renewals, did that take into account any reserve or contingent or other fund which might be required on account of removal to Astoria or anything else than merely to keep the plant in fine physical condition?

A. The expenditures were simply for the purpose of keeping the plant in good condition and repair, Mr. Mathewson, and included nothing in the shape of reserve for any future contingencies.

Q. Have you Exhibit 79 there?

A. No, sir.

Q. You stated to Mr. Kirby that the amount of $14,464,548.62 came out of earnings, did you?

A. No, sir.

Q. How much of it does come out of earnings?

A. $4,770,982.72 comes out of earnings.

Mr. Kirby: He never stated to me that the fourteen million came out of earnings.

Mr. Mathewson: I understood him to do so.

Q. Then the amount of that which comes out of earnings is simply the amount which equals the depreciation which has been
6550 charged off by lost apparatus?

A. That is the case, yes, sir.

Q. As to these repairs $12,331,666.68, from what source do they come?

A. Out of earnings.

Q. And you claim that the net increase represents, does it not, the amount of construction in these various classes of apparatus, less the amount of that construction which offsets depreciation by loss of apparatus and plant?

A. That is the case, yes, sir, and represents an investment of capital.

Q. Mr. Kirby referred to the replacement of a six-inch main by a nine-inch main and said that if the nine-inch main had been laid originally it would have been charged to capital. Isn't it charged to capital anyhow?

A. It is.

Q. If you replace a six-inch main by a nine-inch main what becomes of the value of the six-inch main?

A. Charged off to depreciation and comes out of the capital account and the nine-inch main is capitalized at its cost.

Q. And if you had a new given apparatus and you required more capacity, to use an expression of Mr. Kirby's, which would you do, throw that apparatus away or get additional apparatus?

A. We would get additional apparatus.

Q. There would be no replacement then?

A. There would be none.

Q. What would be the effect on the consumer of gas had this company proceeded in 1823 on the theory that they must put in mains enough and mains large enough in the streets to furnish the requirements in 1923.

The Master: Isn't that a matter of argument?

Mr. Mathewson: Well, almost. It is rather provoked by
6551 the suggestion that we ought to have built our plant originally on that theory, or had such foresight.

Q. As to the putting on of a new roof, does it make any difference as to its being charged into operating expense? Would you call it a repair or a renewal?

A. It would make no difference in either case. The earnings would have to bear the expense of replacing the old roof with a new one.

Q. Mr. Kirby referred to the time when a main would be inadequate. We will assume a six-inch main on one side of the street and we will assume that it would be renewed by an eight-inch main; in such case would that be the ordinary course or would you lay another six-inch main?

A. The practice would be, I think, to lay another six-inch main on the other side of the street and so divide the supply in that street between two mains and be more conveniently situated as to the curb line, etc.

Q. How as to services?

A. And as to the length of services and the convenience in reaching them.

Q. Would you think it would be wise policy to abandon a six-inch main that was doing good service under those circumstances?

A. Not good policy, Mr. Mathewson.

—. Mr. Kirby referred to the coke sold or transferred by coal gas plants to water gas plants. Now, if the coal gas plant stands the expense of transferring the coke, is that cost of cartage taken into account in the figure at which it is transferred?

A. Yes, sir.

Q. If on the other hand the water gas station sends for it would that mean a lower price at the yard of the coal gas station?

A. It would.

6552 Q. Would it make the slightest difference to either station as to which course was pursued either in expense or final result?

A. No difference in the final result.

Q. You observed Mr. Kirby called attention to *Field's Analysis,* where he spoke of the sale by the London companies of ammoniacal liquor and sulphate. Now sulphate is not produced, is it, by the gas companies without any process of manufacture?

A. No, it is not. It is a product of the ammoniacal liquor.

Q. What would that indicate?

A. That would indicate an investment by the company in a suitable working plant and such working force as would be necessary to operate the plant, handle the production, and to sell it, market it.

Q. Did you find anything in *Field's Analysis* that indicated to you that the return on the capital invested in the plant to produce that sulphate had been deducted in getting the forty-eight cents to which Mr. Kirby referred?

A. No, sir, no evidence of that kind.

Q. That would not then represent a net figure, would it, if that were the case?

A. No, not even under those conditions, assuming it was net with respect to the cost of converting it into sulphate.

Q. You stated yesterday that you did not remember the cost to the Consolidated Company of treatment of coal tar and producing the pitch and dead oil as compared with what it might cost the Barrett Company to do that work. Did you in your considerations to which you referred, make estimates at the time as to what it would cost the Consolidated Company itself and how the company would come out in net results?

A. Yes, sir.

Q. As compared with selling it to the Barrett Company?

A. Yes, sir. I did make such calculations and estimate.

6553 Q. What was your conclusion in that regard?

A. My conclusion was if the Barrett Company would be satisfied to retire from the field and leave us the market we might do very well, but with the prospect of competition with them, I did not see my way clear to recommend the necessary investment for taking up the development of that product.

Q. Now, reference was made yesterday to the use of eighteen pounds of coke, per thousand of gas made at the 42nd Street station. Is there any such result as that reached at the 42nd Street station?

A. No, sir. The station records indicate that something like, well between 19 and 20 pounds of coke were used under the retorts at that station per thousand cubic feet of gas made, but as the gas made includes all the oil gas that was made at that station, and as the manufacture of the oil gas produced a great deal of drip oil, which was used under the coal gas benches, the number of pounds of coke used under coal gas retorts at that station calculated in that way per thousand cubic feet of gas made is of no value for any purpose of comparison.

Q. You were also asked in reference to the 111th Street station and said that certain apparatus would have to be added in order to operate the station. Is that the station of which the city took a part?

A. Yes, sir, they condemned it. They took a part of it under condemnation proceedings.

Q. And the apparatus which you state was good—the company's capital is invested in it, is it?

A. Yes, sir.

Mr. Burr: Hasn't that already been gone over, the 18th Street station?

6554 Mr. Mathewson: No, not that particular point. This is 111th Street.

Mr. Burr: Well, 111th Street also.

Q. Is there any reason that you know why that plant has not been completed in full except the action of the city in condemning and taking a portion of the property?

A. I know of no other reason.

Q. You stated yesterday you had a knowledge of the financial department of the company. What did you intend to include in that?

A. Well, I said that yesterday in answer to Mr. Burr's question whether I was not more particularly identified with that department of the business. Perhaps in doing so I may have conveyed the impression that I was not very particularly concerned in the entire proposition of the distribution of gas. Such is the case, however.

Mr. Burr: I think his testimony shows that, Mr. Master. It speaks for itself. I don't think we need to pursue that line of inquiry further.

Mr. Mathewson: I am quite able to determine how far I will pursue the line of inquiry, but I did not intend to pursue it any further.

Q. You were asked whether the renewals and repairs in 1905 as expended were ample. What do I understand you to say on that subject?

A. The expenditures took care of such renewals and depreciation as developed during the year or became apparent, but the charge had nothing to do with the possibilities of future requirements of that particular character or in the nature of contingents or unforeseen expenses.

6555 Q. Do they represent what you consider an average, a fair average, amount?

A. On the contrary, the amount expended for renewals of plant in the year 1905——

Q. I am speaking in total?

A. Oh, no; they do not represent an average by any means, and it could not in our judgment be used in connection with any estimate in connection with the cost of gas for that reason.

Q. Do you concur with the statement of witnesses for the defendants, Mr. Marks and Mr. Hall, that an average period must be taken?

A. That is our contention.

Q. You stated yesterday, referring to the dividends from other expenses, if I understand you, that they were included in miscellaneous income?

A. If I so testified I was in error. They are not included in miscellaneous income, but are included in a statement of income from securities owned, not the statement of miscellaneous income.

Q. And the amount of the miscellaneous income it has been testified to in this case, as I understand, was reduced to cents per thousand.

A. Yes, sir.

Q. And offset ultimately as a receipt against the operating cost of gas, by different witnesses?

A. That was the case, yes, sir.

Q. That includes all the miscellaneous income, doesn't it?

A. Yes, sir.

Q. Where work is done by the Consolidated Company for another company under an arrangement, like laying of mains, for instance, does that go into the operating expenses of the Consolidated Gas Company at all?

A. No, sir. All of the expense incurred in that sort of work is charged, of course, to the other company.

6556 Q. And as to gas apparatus, gas burners or gas stoves, does the gas company in the interest of its business repair that apparatus where it is necessary for the consumer in order to add to the consumption of gas regardless of whether the company sold the apparatus or not?

A. Why, yes, decidedly, as a matter of policy.

Q. Suppose your gas stove business was entirely eliminated from the company's business, would that have any effect on the repairs to gas stoves as an operating expense?

A. It never could be eliminated. We may not rent stoves, or the consumers may elect to purchase stoves instead of renting them, but in either event we would consider it good policy to look after the stoves and keep them in repair as being one of the most important factors in the development of the gas business in the future.

Q. Now, at page 1463 of the exhibits I find that the item of legal expenses paid in 1905 for some services rendered in 1904 was excluded by the accountant. These bills for legal expenses did not appear until 1905, did they?

A. No, they did not.

Q. Is there any possible way in which you could have charged them into the statement for 1904?

A. No, no possible way, nor is there any possible way in which we might in 1906 have charged similar disbursements applying to 1905 into the year 1905.

Q. Now, in reference to the year 1905, if you excluded these on the theory of the accountants, would it not be necessary to include the amount of legal services rendered in 1905 for which no disbursements were made?

A. I should say most decidedly.

Q. Did you pay your legal bills incident to the gas investigation which took place in 1905 during the year 1905?

A. No, sir.

6557 Q. Is it possible in the conduct of your business to render your operating expense statement in any other way than it is?

A. No, impossible to do it by any other process.

Q. As a matter of fact have you any reason to suppose that legal expenses rendered in the year 1905, not charged until 1906, would be any less in amount than those rendered in 1904 which were charged in 1905.

Objected to as incompetent, immaterial and irrelevant.
Objection sustained.

Q. You were asked as to your knowledge in reference to the accounts of the original companies and the cost of the property of the original companies coming solely from your examination of the testimony before the committee of 1886. You knew something about the Knickerbocker plant yourself, didn't you, after 1884?

A. Yes, sir.

Q. Is it or is it not a fact that the Knickerbocker plant was so large, so extensive after 1884 that the Harlem plant was shut down and the entire upper part of the city furnished from the Knickerbocker plant for some time?

A. That was the case.

Q. And that your Knickerbocker plant appeared in the $20,942,000 to the extent of only $810,000?

A. That is all.

Q. Largely franchises?

A. The testimony showed it cost over $3,200,000.

By Mr. Burr:

Q. Have you learned that since 1884 or did you know that in 1884?

6558 Mr. Mathewson: He knew that immediately following 1884, that that course was pursued.

Q. You were not called as a witness before the investigating committee of 1886, were you?

A. No, sir.

Q. You had that knowledge at that time?

A. Yes, sir.

By Mr. **Mathewson**:

Q. Referring to the comparison between real estate to which counsel has called your attention, and made by Marwick, Mitchell & Co., the estimated value of the real estate in 1884 as they gave it was something over $10,000,000, wasn't it?

A. $10,322,000.

Q. But that was the real estate which was appraised at that time and was the real estate of all those companies, was it not?

A. That is the case, yes, sir.

Q. Whereas the real estate which they put on the other side of the account showing original cost covered the real estate of only five companies, did it not?

A. That is the case.

Q. The Knickerbocker real estate was not in there at all?

A. Was not in there at all.

Mr. **Burr**: Haven't we gone over that on direct examination?

Mr. **Mathewson**: No, we did not.

Q. So that did the difference between $10,322,000, the valuation of 1884 as stated by Marwick, Mitchell & Company, and the figure you gave as the cost of the real estate, actually show the depreciation of the real estate whose cost they showed?

A. No, it did not show it.

6559 Q. It did purport to do so?

A. It purported to do so, yes, sir.

Q. You were asked as to whether or not an arrangement had been made as to the price to be paid to the Astoria Company for gas. Do you know what method of bookkeeping has been determined upon yet in treating that case?

A. No, there has been no method yet determined. It is merely a matter of bookkeeping.

Q. Is it anything else?

A. Nothing else.

Q. Do you know whether it has been determined merely to charge the gas on the Astoria books at the bare cost and have the amount added by the Consolidated to represent the return on the investment at Astoria, or whether it is intended to charge to the cost of gas there the amount to make a return on that investment before the Consolidated receives the gas?

A. Those matters have not been determined yet. They are merely matters of bookkeeping, but they have not been decided.

Q. You were asked in reference to the Mutual stock, the Mutual Gas Light Company in 1884. When you testified yesterday as to the Mutual property were you referring to the par value of the stock outstanding or to the assets as found by the 1884 commission?

A. The actual assets of the company. No reference whatever to the share capital.

Recross-examination by Mr. **Kirby**:

Q. Where did you get your values for the Knickerbocker plant such as you have just given?

A. From the testimony as found in Senate Document 47.

Q. And from no other source?

A. No other source than from that testimony.

6560 Q. Mr. Mathewson has taken occasion to refer to *Field's Analysis* again. I ask you if it is not customary when figures are compared to compare net figures with net figures and gross figures with gross figures?

Mr. **Mathewson**: How does he know except you point out a case.

Mr. **Kirby**: He is an accountant and is skilled in all matters of this kind.

A. I know this, that that is not a very flexible proposition, that *Field's Analysis*. It furnishes year after year facts under forms that were used years ago and have not varied since, and they have to take a company's statement and adopt it in a measure to their form, and how they do it I don't know.

Q. If your company was getting out figures showing costs of various substances, comparing one works with another, would you compare figures at one works on net basis, and figures at one works on gross basis?

A. No, we would compare both the net and gross and the expenses that entered in between the two.

Q. But it is your endeavor to bring that down to a basis which is possible of comparison?

A. Decidedly.

Q. And such basis would be net to net or gross to gross?

A. It would be.

Q. I call your attention to the columns in *Field's Analysis* that we were looking at yesterday, ammoniacal liquor and sulphate of ammonia. The Gas Light Company in London per thousand cubic feet of gas gives a statement of 2; the Commercial of 1.75; the South Metropolitan 2.31; the average 2.09. Is there anything in your method which would show you any of these companies were
6561 selling ammoniacal liquor or sulphate of ammonia?

A. Why, no, because those companies did not make exclusively coal gas, all of them; some of them made oil gas, and you get a factor when you have oil gas in the proposition that creates variations that do not mean anything.

Q. It might be one and might be the other?

A. It might be one and it might be the other.

Q. And it might be both?

A. And it might be both, Mr. Kirby.

Q. You have spoken of the depreciation account. I think in answer to my question of yesterday you said there was no account under the name of depreciation.

A. No, I didn't say so.

Q. Have you what is known as a depreciation account?

A. That is the account in which we carry the items shown in this exhibit of Marwick & Mitchell during the year, which is closed at the end of the year into the renewal and contingency account.

Q. What is the name of that account?

A. The name of that account is depreciation account.

Q. And such depreciation account has been carried as such since 1884?

A. As such since 1884.

Q. And it is under that heading of depreciation account that renewals are charged?

A. That is the case; and only renewals.

Mr. Kirby: Mr. Carter has taken occasion to refer to the Mutual Company, the cost there, and to make a comparison between Mr. Edgerton's figures and the Mutual Company saying that he got his information from the testimony before the State of New York Commission of Gas and Electricity, and I think it was only proper under
the circumstances that Exhibit 31 before that commission,
6562 being statement furnished to the State Commissioners of Gas
and Electricity by the New York Mutual Gas Light Company, cost of gas for the nominal year ending October 31, 1905, be placed in evidence.

Mr. Mathewson: I shall not offer it. Mr. Kirby is entirely wrong in his statement. No such evidence offered.

Mr. Kirby: No such evidence offered. That is quite true.

Mr. Mathewson: He did not compare Mr. Edgerton's result with the Mutual Companies. He merely took December, 1905, and compared the Mutual cost with the Consolidated cost.

Mr. Kirby: Very good. Then can I have Mr. Carter's figures for December, 1905, which you have just stated he didn't compare.

Mr. Mathewson: He has already testified.

Mr. Kirby: He has testified to the result but not to the items going to make up the result, and I was trying to make those short-cuts of which Mr. Carter spoke.

The Master: I have no doubt if he has them in his memorandum he can send them down and put them on the record as part of his testimony.

Mr. Kirby: If he has not let him so state.

Mr. Mathewson: What figures do you mean?

Mr. Kirby: I will call attention to it after recess.

Mr. Mathewson: No, let us have it now.

The Master: If it is anything to be done as part of Mr. Carter's testimony let us have it now.

6563 Mr. Kirby: If you will look at page 6372 of the printed testimony, you will find this question:

"Q. And how about the station cost of the Mutual and Standard which operate in New York City and have their plants here as compared with the station cost of the Consolidated at its water gas stations? A. The Mutual is higher."

Then a lot of objections follow.

Mr. **Mathewson**: That is another thing, station cost for the year.

Mr. **Kirby**: Then on page 6374: "A. The station cost of the Standard for the nominal year ending October 31st, 1905, was 30 cents or .62 of a cent lower than the Consolidated cost. Q. And it had a single station as against many for the Consolidated? A. Yes, sir. The Mutual cost was 34.34 of a cent for the same period."

That is for the nominal year, as you will see by referring——

Mr. **Mathewson**: Of course, there is no question about it. The comparison of oil was for December, 1905, as to the two companies.

The **Master**: You want to know how he got at his 34.34?

Mr. **Kirby**: Yes, and put in his statement for the nominal year as placed before the Gas Commission and to which he referred.

The **Master**: Well, you are certainly entitled to cross-examine him about that 34.34. I do not say that you are entitled to put in evidence.

Mr. **Kirby**: I will ask him the details of that then.

6564 Mr. **Mathewson**: You cannot ask him from that. You will have to get your Mutual *printed* exhibit, I think.

The **Master**: I do not think it is of enough importance to waste any great amount of time on.

By Mr. **Kirby**:

Q. Referring you to page 6374, I ask you if you will give the totals which went to make up the figure of 34.34 given as the Mutual cost, and ask you if you obtained those figures from the statement before the State Board of Gas Commissioners?

A. The figures were prepared from the statement that was prepared for the State Board of Gas Commissioners. I don't know whether that is a copy or a correct copy of it.

Q. Have you such copy as you need?

A. Yes, sir, I have.

Q. Can you produce that?

A. I can.

Q. Will you produce it? Just take and read off the items, then we will have it?

A. The details of the calculation are as follows:

(Take in Exhibits.)

At 1.40 P. M. a recess was declared till 3 P. M.

After Recess.

January 30, 1907—3:00 p. m.

Frederick J. **Mayer** recalled by complainants in rebuttal.

Direct-examination by Mr. **Mathewson**:

Q. Mr. Mayer, you have read the testimony of Messrs. Edgerton and Marks respecting their valuation of plants, apparatus, general connections and holders?

A. I have.

6564a NEW YORK MUTUAL GAS LT. CO.

COST OF GAS FOR THE NOMINAL YEAR ENDING OCT. 31, 1905.

		Cost per M. made
Coal Used in Generators, 31,812.75 Tons, at $4.40	$139,976.08	06.17
Coal Used Under Boilers, 13,220.18 Tons, at $2.3588	31,183.57	01.38
Coal Handling	1,684.48	00.07
Oil Handling (Drip)	5,181.95	00.23
Gas Oil, 10,725,228 Gals., at $ .04495	482,120.96	21.26
Oxide, 33,006 Bus., at $ .1814	5,986.19	00.26
Water, 6,135,350 cu. ft., at $1.00 per M.	6,135.35	00.27
Sundries, Wood, Waste, etc	791.50	00.03
Purifier Labor	5,056.84	00.22
Other Labor	51,843.79	02.29
Repairs	31,478.77	01.39
Expense at Works	10,595.75	00.46
Distribution at Works	7,241.90	00.32
Total	$779,277.13	34.35
Less Wharfage	323.29	00.01
(Gas Made, 2,268,275,000 c. f.)	$778,953.84	34.34

6565 Q. And have you, so far as you are able, in the time at your disposal gone over the schedules that they have filed?

A. I have.

Q. You have observed the estimates that they have made on your valuations, and the figures that they have given?

A. Yes, sir.

Q. Now, taking first Mr. Marks' values, do you find that Mr. Marks has omitted any apparatus which you valued?

A. Yes, sir.

Q. Have you prepared a schedule stating in some detail what he did omit which you have discovered?

A. Yes, I have.

Mr. **Burr**: Do I understand this is different from the original valuation of the apparatus omitted from the schedule as presented by Mr. Mayer?

Mr. **Mathewson**: Yes, Mr. Mayer. That Mr. Marks has omitted the apparatus which Mr Mayer valued.

Mr. **Kirby**: Which valuation is in the testimony.

Mr. **Mathewson**: Yes. Certainly. I am referring now to Mr. Mayer's——

Mr. **Burr**: Previous testimony.

Mr. **Mathewson**: Certainly.

Q. Does this schedule which I show you contain a statement of the omitted items so far as you have discovered?

A. Yes, sir.

Q. I see it consists of several columns, one of which is headed Mayer's Cubic Contents. Under that column appears the cubic contents as you estimated them and your cents per cubic foot under that estimate, does it not?

A. Yes, in some instances.

Q. And the second column is: "Mr. Marks' Cubic Contents"?

A. Yes.

6566 Q. And the contents per foot which he estimated?

A. Yes, sir.

Q. The next column is his valuation, and the last column is your valuation?

A. Just the reverse, the third column is mine and the fourth column is Mr. Marks'.

Q. And in the last column the difference appears both in statement and cubic feet, and in the cost does it not?

A. Yes.

Q. But where you have a minus sign in the last column before any amount, what does that indicate?

A. It means that it is less than my valuation. Where there is a plus sign it means it is more.

Q. And where items are entitled entirely they are marked "omitted" if I understand this correctly, and the valuation which is inserted in that then is your valuation of that particular item?

A. That is right.

Mr. Mathewson: I offer this schedule in evidence as Complainant's Exhibit 370.

Mr. Burr: I object to this Mr. Master, because apparently what it contains is already in the evidence. This does not purpose to give anything more, for instance, than the differences between Marks' cubic contents and Mayer's cubic contents. That has already appeared in the record. Mayer's valuation appears on the record, and Marks' valuation appears on the record. So far as matters have been omitted by Mr. Marks, I have no objection to that being called to the attention of the Master, but this spreading of a lot of comparative figures on the record I object to.

6567 The Master: If that tends, as I think it does, to save the time of the witness in pointing out what he claims to be the errors in computation of other witnesses, I will let it in.

Mr. Mathewson: But more than that, Mr. Master, this contains the omitted items and the cubic contents Mr. Marks employed, which were mostly included in a general schedule, not put in evidence, but which as I recollect he called attention to and submitted to us for our examination and criticism.

The Master: I will admit it.

Received in evidence and marked Complainant's Exhibit 370, January 30, 1907.

Mr. Burr: I except.

Q. Now, have you also made up a schedule, Mr. Mayer, for convenience in giving your testimony for counsel, showing the valuations as given by Mr. Marks originally, and adding back the items of depreciation which he deducted, so as to get the original cost without depreciation, as per his figuring?

A. I have.

Q. And also adding in the omissions in the cost of each plant, where you have noted omission of apparatuses?

A. I have.

Q. And then for purposes of comparison with your own testimony have you upon that basis of original cost computed the ten per cent. engineering charge, which you consider to be proper, and five per cent. interest?

A. Yes, I have added that to it.

Q. And is this schedule which I now present separated as to stations, the result of adding these omissions and making the other corrections to which I have just called your attention?

A. Yes, sir.

6568 Q. Now, then the original cost taking all the plants together with the ten per cent. for engineering charge and five per cent. interest charge added to Mr. Marks' valuation, together with the omitted items, amounts to how much?

A. The total of plants and holders and stations $14,345,635.00.

Q. As against your total without depreciation of how much?

A. $16,137,477.00.

Q. Or about $1,800,000 less?

A. Yes.

Q. And you have not in this $14,345,635.00 included the cost of installing apparatus, setting it up, while Mr. Marks may have given the cost of apparatus merely delivered at the station?

A. No, I have given his cost as given in the testimony.

Q. You have read his testimony where he stated that he considered your value of apparatus substantially correct.

A. Yes.

Q. And did your valuations for the individual items of apparatus to which he was testifying include any ten per cent. and five per cent. as they have appeared on your schedule of individual items, or do you add that ten per cent. and five per cent. at the end?

A. At the end, each station.

Q. So that the individual valuations of the different pieces of apparatus in your case do not include the ten per cent. and the five per cent.?

A. They do not.

Mr. Mathewson: I offer this paper in evidence.

Received in evidence and marked Complainant's Exhibit 371, January 30, 1907.

Q. Referring now to Mr. Edgerton's estimate of value of plant less depreciation, $9,367,344.25, do you find that he com-
6569 puted his three per cent. for engineering and superintendence on the original cost of the plant new or on the value of the plant after you have taken out depreciation?

A. After depreciation was taken out.

Q. Is that in your judgment a proper way to compute the engineering expenses?

A. It is not.

Q. Why not?

A. Because no depreciation exists when you make your estimate originally. You estimate on a new plant, to which ten per cent. for general engineering is to be charged.

Q. Well, what have you to say as to the sufficiency of three per cent., according to your experience and knowledge, to cover the general expenses for engineering and superintendence and the other items which are not included in the amount paid to the contractor?

A. The actual expense is nearer fifteen per cent. than ten per cent.; in some instances the grading consists of the removal of twenty to twenty-five feet of earth on top of the original ground, before you get the surface for the foundation.

Q. Now, Mr. Edgerton has also employed four per cent. as the amount allowable for interest. Do you find that he has also computed the four per cent. on the depreciated value of the plant instead of on the original value?

A. Yes, sir.

Q. Is that a correct method of procedure?

A. It is not for the same reason that the engineering charges are not chargeable on that basis.

Q. Mr. Edgerton stated he allowed four per cent. because he thought that a somewhat shorter period than two years might be required to construct these plants, if they were to be constructed. What is your judgment as to the period required being less than two years?

A. I know it cannot be done in less than two years.

6570 Q. You observe that Mr. Edgerton in comparing his values of depreciated plants placed only value on apparatus after depreciation was taken, or value on depreciated apparatus in many instances, did you not?

A. Yes, in many instances.

Q. But coming to the valuation of the plant, now upon Mr. Edgerton's basis, have you made a computation adding in the original cost of apparatus as given by him, or the valuation of these items new, where he has accepted your valuation?

A. I have.

Q. And will you state what that would make his valuation upon his own basis.

A. The second column there I think, that is excluding the omission——

Q. Excluding the omission——

A. $10,266.704.

Q. And do you find that he has omitted various items of apparatus?

A. I do.

Q. What do those which you have observed that he has omitted, amount to in the total?

A. $124,544.

Q. And $124,544 is your valuation of the omitted items, is it?

A. Yes.

Q. That would make a total original cost new, including these omitted items, of how much?

A. $10,388,248.

Q. And if you include his engineering charge at three per cent. and interest at four per cent., what would the total be?

A. $11,115,425.36.

Q. Now, if you were to add the engineering charge of ten per cent., which you say is the minimum figure, and the interest charge of five per cent. on the basis of two years' period required, what would the total cost be, new?

A. $11,998,425.

Q. Now, the sheet which you have here shows the detail by stations on such testimony, does it?

A. It does.

6571 Mr. Mathewson: I offer that in evidence.

Received in evidence and marked Complainant's Exhibit 372, January 30, 1907.

Q. Now, in reference to your method of computing the valuation of buildings in the time at your disposal, Dr. Marks claimed at the outset in his testimony that such a basis of valuation would not give correct results. What is the fact in reference to that?

A. Well, I know from my own practical experience that the method which I pursued in establishing the cost of the buildings, basing the same upon a certain amount per cubic foot is absolutely correct, particularly when a number of buildings such as form a gas plant are to be considered. It is possible that in one or the other of the buildings a slight difference may occur in the unit of value, but in the total aggregate for all buildings, I am absolutely sure that the valuation is correct.

Q. Have you made comparisons between such estimates and the actual cost of buildings in order to determine whether it does figure up substantially correctly?

A. I have. I have made an estimate of the 132nd Street governor and boiler house. In fact, that estimate was made last summer and the unit of valuation per cubic feet was based upon such detailed estimates. I have made estimates of the sheds 1 to 6 at the 21st Street station. I have made estimates of the foundations of the old and new generator house at the 21st Street station. I also obtained the actual cost of the various buildings, retort houses, that have just been completed under my own supervision and in accordance with my designs, and the actual cost of such buildings also indicates that my applied units of valuation are absolutely correct.

6572 Q. Well, if there is any difference, do you find that your unit of valuations, the unit of value used by you, are greater or less than the unit of value and actual cost of these buildings?

A. If anything they are a little less than those of the actual cost of buildings I just referred to, and some of these buildings, one at least, was not constructed in New York at all. They were constructed under conditions which are not applicable to New York cost.

Q. Less expensive or more expensive?

A. Less expensive, that is, less for labor in particular, and still the unit cost per cubic foot shows almost as high as the one I have applied.

Q. Now, in estimating the 132nd Street governor and boiler house for the purpose of testing your unit figure, was that estimating from drawings and detailed specifications?

A. That was from drawings, specifications, and also from the building itself.

Q. And have you such drawings and specifications here?

A. I haven't the drawings and specifications, but I have the detail estimates.

Q. Now, Dr. Marks subsequently used your cubic contents of value in computing his valuation of buildings?

A. Yes, sir.

Q. And he stated he took as the unit of the governor and boiler house at 132nd Street, 14-4/10 cents per cubic foot, as against the 13-2/10 which was your value?

A. Yes, sir.

Q. Did you use that unit of value or did you use the cubic foot value which you employed at 132nd Street in the same method in reference to all the other buildings, making allowances for changes as due to the character of buildings?

A. Well, yes, each house the value is proportioned to the character and detail in design of that particular building, adapted to such conditions.

6573 Q. And as Dr. Marks took a higher figure for the 132nd Street, which he adopted as a unit, if he had followed the same value throughout, wouldn't his valuation of buildings have exceeded yours instead of being less?

A. It would undoubtedly.

Q. Now, he proceeds taking the 132nd Street building to apply this as the unit of the other buildings, and he referred particularly to the 112th Street building, where he allowed fifteen cents per foot as against 14-4/10 for the 132nd Street building with practically the same unit——

A. Yes.

Q. Is the same unit applicable to these two buildings?

A. It is not.

Q. Why not?

A. Well, the superstructure apparently while of identical construction or similar in construction, the foundations vary entirely.

Q. Which was the more expensive construction?

A. The 111th Street building, for various reasons. First, because it contains a very much larger amount of machinery, and then the foundations were carried down to a depth of about sixteen feet, which was necessary on account of the two large holders which were constructed in the immediate neighborhood, demanding excavation there for the reason that all the earth on the original site of this building had to be removed.

Q. Now, Dr. Marks referred to the finish of the 132nd Street buildings as finished substantially more expensively than the 111th street?

A. There is very little difference in the finish of any of these buildings; the finish forms but a very small portion of the total cost; although in these two instances they have some enameled brick finish in the interior of the rooms.

6574 Q. In examining the unit figure Mr. Marks employs in reference to the other buildings as compared with the 132nd Street, are you able to find any consistent relation in the character of buildings and the unit figure used?

A. I am not.

Q. Do you find anything in his figures which changes your own estimate as originally made, as to the value of buildings?

A. I do not.

Q. I think Dr. Marks gave no details for the different buildings.

A. No.

Q. Except as to the cubic feet?

A. No.

Q. Now, taking Mr. Edgerton's detailed prices he computes the 132nd Street building at $21,160, but his schedule it appears would call for a value of $30,000.

A. It does.

Q. Now, have you a detailed estimate of the 132nd Street building comparing your values with Mr. Edgerton's, pointing out wherein he has omitted items or is in error?

A. I have.

Q. Is this it (handing witness paper)?

A. Yes, sir.

Q. And does the comparison of the figures or the items as given under the head "Mayer's Valuation" as compared with the column "Edgerton's Valuation" indicate the extent of the figure in which you think he is in error in each case?

A. It does.

Mr. Mathewson: I offer this paper in evidence.

Received in evidence and marked Complainant's Exhibit 373, January 30, 1907.

Q. Now, you have prepared a detailed estimate, have you not, to check your figures on the No. 2 shed at 21st Street?

A. Yes, sir.

Q. And that would give a total of the detailed estimate of how much for the shed?

A. $67,846.

6575 Q. Well, that is the amount of your original schedule, is it?

A. That is the amount for the original shed, the total estimate, first value, $65,888.13——

Q. That is a trifle less than your original estimate?

A. Yes.

Q. But did this average that you employed of 16 cents per cubic foot, for the sheds at 21st Street, would that apply also to the shed No. 6, as well as the purifier house and condenser there?

A. It applies to all sheds from 1 to 6, and some of them are at present used as purifiers and condenser houses.

Q. How do the purifier house and condenser house, as well as shed No. 6, compare in expense of construction with shed No. 2?

A. Well, the average for all of them is 16 cents a cubic foot, for the reason that the purifier house and condenser house have double floors and more foundations with apparatus which is omitted in the case of the shed.

Q. So that the average of 16 cents you would consider fair?

A. It is fair for all of them.

Q. Now, in figuring out the valuation of the coal shed at this station by a detailed estimate according to your figures you find results how?

A. I find a value of $69,830.

Q. And what have you got there in your schedule, as the value, according to cubic contents?

A. $63,168.

Q. And to what is the increase in value by the detailed estimate due in general?

A. At the time the original valuation was made the inclined bottom supported upon timbers for the carrying of coal was not calculated in detail. Such has been done now and that increases the original value given.

6576 Q. Now, you have testified as to the foundations which you have employed in your apparatus and buildings. How do you find what character of foundation was used, or determine what character of foundation to figure upon in these estimates?

A. Wherever the character of the ground appeared doubtful or the character of the foundation, in each instance, I referred to drawings where I could find such, and where I could not find drawings I got the information from the people who had been at the works for a long time.

Q. And isn't it a fact that some of these buildings are on soil that is way below the depth of the street, that is on low ground?

A. All of the buildings are on such soil.

Q. Now, from your experience in addition to the information that you got from books and other sources what would you say as to the character of the foundations which must be required under buildings on such soil?

A. They could not be constructed without pile foundations.

Q. Now, do you find on Mr. Edgerton's valuations for these buildings to which I have called your attention, that he has made any allowance for pile foundation or any foundation except the ordinary foundations that could be used in the hard soil?

A. He had not, and in some instances he did not allow enough for ordinary foundations.

Q. Now, Mr. Edgerton suggested that there were no foundations under the water gas apparatus which he was able to ascertain, have you a sketch here showing the foundations under these apparatus as they really exist?

A. I have, and this sketch was prepared from drawings which I saw at the works, which I was told were used for the construction of these foundations.

Q. Did those drawings appear to be correct so far as you
6577 could check them by your own observation?

A. They did.

Q. And how did you find this foundation was constructed, of what material was this foundation in the old generator house?

A. In some of the drawings I saw at the works show a depth of foundation of from 8 to 10 feet below the surface line, supported on piles and stone flagging.

Q. What did you find that the foundation under the water gas apparatus consisted of?

A. The foundation under the water gas apparatus consisted of solid concrete five feet in depth, under the superheater and carburetter and 5 feet 6 inches of depth under the generator.

Q. Did you find that Mr. Edgerton in his estimate made any allowance for these expensive foundations?

A. No, sir.

Q. What did you find the detail estimates for the foundation under the buildings as well as the apparatus give combined with the old and new generator houses?

A. The total of all foundations for buildings and apparatuses is $88,595.

Q. Now, at what figure did you carry these foundations in the new and old generator houses in the schedule of valuations which you presented, and which are critisized by defendant's witnesses?

A. The valuations of the foundations for the two buildings amounted to $32,197 in the instance of the new generator and $31,065 in the instance of the old generator house.

Q. Making a total valuation of for the two houses?

A. Of $63,262.

Q. Well, now, it appears that the difference between that and the detailed estimate you have specified is $25,333. How is that difference taken care of?

A. In the application of the unit values per cubic foot of
6578 building done. I have allowed for ordinary foundations constructed in soil that requires no re-enforcement. In other words, in all my unit valuations on buildings, by the cubic foot foundation, of about four feet depth in ordinary soil below the surface line are included. Therefore, this only represents the difference——

Q. Now, have you endeavored to establish the value of foundations given by Mr. Edgerton from his testimony in relation to these buildings?

A. I tried to, but it was impossible as the foundations were not given in detail separately from the rest of the building.

Q. Have you examined the values which he gave for the excavation of these buildings?

A. The excavation of these buildings? A. The excavation is chargeable to the foundations only. I have examined such items in Mr. Edgerton's testimony.

Q. What do you find in that regard?

A. In the instance of the old and new generator house I find that he has a total item for excavation amounting to 629 cubic yards.

Q. Figured at how much per yard?

A. At a dollar per yard, a total value of $621.00.

Q. Now, what is the cost of excavation, I mean the depth of excavation of the character required for such foundations in the City of New York, including the carting and dumping?
